RP3.11

INDEX

AARONSON, Sheldon, and others: Vitamin B_{12} Distribution between Plasma and Cells, 1043
Abbatt, J. D., and others: The General Radiation Syndrome—Initial Reaction in the Monkey, 1466
Abbott, S. H.: Appointed superintendent of agriculture, St. Kitts—Nevis—Anguilla, Leeward Islands, 21
Abe, Yukihide, and others: Effects of Kinetin on Division of Yoshida Sarcoma Cells, 985
Abelès, F: Interference Spectroscopy, 956
Abercrombie, Dr.: Biological Aspects of Cancer (Mechanism of Cell Movement), 831
Abnormal Haemoglobins in Jamaica: Incidence of (Dr. L. N. Went), 1131
Abnormal Haemoglobins in Monkeys (G. F. Jacob and Dr. N. C. Tappen), 241
Abnormal Metamorphosis in Saturniid Moths infected by a Microsporidian (Dr. L. H. Finlayson and W. Ann Walters), 713
Abortions (Human): Determination of the Sex of, by Nuclear Sexing the Cells of the Chorionic Villi (Prof. A. C. Stevenson and R. H. McClarin), 198
Abrahám, A., and Minker, E.: Innervation of the Lamellibranch Muscle, 925
Abrams, A., and others: Combined Light and Velocity Measurements of the Variable Star 12 Lacertae, 1112
Abramson, Prof. Harold A. (edited by): Neuropharmacology—Transactions of the Josiah Macy, Jr. Foundation Second Conference, Princeton, 1955, *review* by Dr. Marthe Vogt, 304
Abrikosov, A. A.: Low-Temperature Physics (Behaviour of Superconductive Alloys), 461
Absence of Lethal Radiation Effects following Massive Oral Administration of Plutonium (Maurice P. Sullivan and Dr. Roy C. Thompson), 651
Absence of Wound Healing in Young Chick Embryos (Prof. Paul Weiss and A. Gedeon Matoltsy), 854
Absorption (Light), by Green Algae: Effects of Oxygen upon (Prof. Britton Chance and Bernard Strehler), 747
Absorption (Vitamin B_{12}), by Substances other than Intrinsic Factor: Enhancement of (Samuel M. Greenberg, John F. Herndon, Edward G. Rice, Edwin T. Parmelee, John J. Gulesich and Edward J. Van Loon), 1401
Absorption (Water), by Submerged Leaves (T. R. Milburn), 1368
Absorption Spectra of Flat Flames using a Multiple-Reflexion Technique (G. N. Spokes and Dr. A. G. Gaydon), 1114
Absorption Spectra (Ultra-Violet), of L-Ascorbic Acid in Aqueous Solutions (Dr. J. S. Lawendel), 434
Abstracts of Biological Sciences, International, 268
Abyss: Life in the, *review* by Dr. L. Harrison Matthews, 349
Abyssal Circulation of the Ocean (International Union of Geodesy and Geophysics Symposium on), 733
Academic Freedom in South Africa, 686, 1163
Acceleration of Life-cycle of Southern Pine (Earhart Plant Laboratory of the California Institute of Technology), 892
Accelerator: An Experimental Proton Linear, using a Helical Waveguide (D R. Chick, D. P. R Petrie, D. G. Keith-Walker and H. Longley, 432
Acceptors of Deoxypentose Nucleic Acid: Protoplasts of *Escherichia coli* as Sources and—Rehabilitation of a Deficient Mutant (Prof. Erwin Chargaff, Herbert M. Schulman and Dr. Herman S. Shapiro), 851
Accident at Windscale (Prof. W. Murgatroyd), 1093
Accidents in Childhood—Facts as a Basis for Prevention (World Health Organization, Technical Report Series No. 118), 371
Accidents (Domestic Burning): Flammability of Apparel Fabrics in relation to (British Standards Institution), 1102
Accomplishment: Wittgenstein's, *review* by F. I. G. Rawlins, 399
Accumulation of a Stable Phosphorus Compound in Glycolysing Insect Muscle (Václav Kubišta), 549
Acetate in *Hevea brasiliensis*: Metabolism of (A. D. Patrick), 37
Acetate (Ethyl): Rapid Extraction with, of Free Fluorescein Derivatives from Fluorescein *iso*Cyanate-Globulin Conjugates (Dr. J. K. Dineen and G. L. Ada), 1284
Acetobacter Species: Formation of β-1, 4-Oligoglucosides by certain (Dr. Robert Steel and Prof. Thomas K. Walker), 201
  A Highly Specific Growth-Inhibitory Factor produced by certain (Dr. Robert Steel and Prof Thomas K. Walker), 811
Acetocarmine Squash Technique for the Fucales (Dr. Margaret Naylor), 46
Acetylcholine and Quinidine: Effect of, on Atrial Cellular Potentials (Dr. Edward A. Johnson and Dr. P. A. Robertson), 1483
Acetylcholine-like Salivary Poison in the Marine Gastropod *Neptunea antiqua* (Dr. Ragnar Fänge), 196
Acevedo (Silvina Estrada de) Fellowship for Research in Experimental Leukaemia, 530
Acheson, R. M.: Acridines, *review* by Dr. M. F. Grundon, 209
Achromats' Parents: Colour Vision of (Prof. R. W. Pickford), 926
Acid and Neutral Media: A Unified Theory of the Mechanism of Inhibition of Corrosion of Iron in, based on the Electrocapillary Behaviour of Ions (C. P. De), 803
Acid Phosphatase in *Trichonympha turkestanica* Bernstein (Trichonymphina, Trichonymphidae): Cytochemical Localization of (M. M. El Mofty), 1367
Acid—Schiff Positive Material (Periodic): Occurrence of, in the Pituitary of the Parrot Fish, *Pseudoscarus guacamaia* (Dr. A. J. Matty), 1055
Acid Gastric Secretion: Inhibitory Effect of 5-Hydroxytryptophan on (A. N. Smith, J. W. Black and E. W. Fisher), 1127
Acids: Titration of Mixtures of (D. Sims and L. Peters), 805
Acids (Aromatic), in Plant Tissues: Separation and Identification of, by Paper Chromatography (Dr. L. A. Griffiths), 286
Acids (Chloro-organic): Decomposition of, by Fungi (Prof. H. L. Jensen), 1416
Acids (Water-soluble), from Leaf Wax: Solubilization of Copper by Leaves and (Defence Mechanism of Plants against Fungi), (Dr. J. T. Martin and E. Somers), 797
Ackermann, W. W.: Latency and Masking in Viral and Rickettsial Infections (Experiments with Poliomyelitis-infected Cultures), 788
Acridines (R. M. Acheson), *review* by Dr. M. F. Grundon, 209
Acriflavine as an Effective Agent for Eliminating *F*-factor in *Escherichia coli K*-12 (Yukimori Hirota and Teiji Iijima), 655
Acta Electronica (*Optica Acta* and): Joint publication of the Proceedings of the International Symposium on the Physical Problems of Colour Television (Paris, 1957), 963
Acta Virologica (Czechoslovak Academy of Sciences), Vol. 1, No. 1, 1170
Actinomycete Disintegration of Raw Wool (Melva E. Philipson), 1205
Action: Documentation in (Jesse H. Shera, Allen Kent and James W. Perry), *review* by Prof. S. I. Tomkeieff, 674
Action of Autolytic Enzymes: Bacterial Protoplasts from *Bacillus* Species by the (F. A. Dark and R. E. Strange), 759
Action as an Auxin: Relation of Structure of 2,4-Dichlorophenoxyacetate to its Mode of (Emmett J. Johnson and Prof. Arthur R. Colmer), 1365
Action of Blue Light on the Germination of Seeds (Prof. Michael Evenari, Dr. Gert Neumann and Dr. Gabriel Stein), 609
Action of Copper on Mammalian β-Glucuronidase (Dr. G. A. Levvy and C. A. Marsh), 197
Action of Diphenol on Arthropod Cuticles (J. Kennaugh), 238
Action of Ethylene Dibromide on Hen Gonadotrophic Hormones (Dr. Eugenia Olomucki), 1358
Action of Glucose-1-Phosphate on the Deposition of Phosphate in the Bones of Growing Diabetic Rats (Dr. N. Siliprandi, G. De Bastiani, F. Petrelli and B. Fischetti), 1357
Action of Gonadotrophins on the Ovary (Prof. C. W. Emmens, P. J Claringbold and D. R. Lamond), 38
Action of Penicillin: An Investigation of the (A. Shulman, M. I. B. Dick and K. T. H. Farrer), 657
Action (Autonomous), of Lethal Mutations induced in the Germ Cells of *Drosophila melanogaster* by 2-Chloroethyl Methanesulphonate (C. E. Purdom), 81
Action (Calorigenic), of Glucagon (I. W. P. Davidson, J. M. Salter and Prof. C. H. Best), 1124
Action (Clearing), of Lysolecithin (Prof. W. Neumann and E. Habermann), 1284
Action (Clearing), of Lysolecithin on Brain Homogenates (Dr. G. R. Webster), 660
Action (Coagulant), of Proteolytic Enzymes (Dr. Herbert M. Rubinstein), 1202
Activation of Polynucleotide Phosphorylase by Salts (Roland F. Beers, jun.), 246
Activator: Phosphorylase Inhibitor in Potato—Separation from, and Possible Relation to Chlorogenic Acid (Dr. Sigmund Schwimmer), 149
Active Lipoprotein: Elastin, a Metabolically (Dr. Frank S. Labella), 1360
Active Nitrogen: Spectra of Flames supported by (K. R. Jennings and Dr. J. W. Linnett), 1272
Activity: Surface (Dr. J. H. Schulman), 225
Activity of Liver Phosphorylase in Normal and Adrenalectomized Rats: Influence of Starvation and Glucose Load on the (Dr. N. Schwartz Sorensen), 857
Activity (Antihypertensive), of Hexahydro-1-Azepinepropionamidoxime (Robert P. Mull, Robert A. Maxwell and Albert J. Plummer), 1200
Activity (Antimitotic), of 5-Tertiary Butyl Benzimidazolone (Dr. H. C. Stoerk, R. N. Arison and J. E. Hawkins, jun.), 1428
Activity (Biological): Protein Structure and—Paris Symposium (Dr. Kenneth Bailey), 833
Activity (Cardiotonic), of the Potato-Root Eelworm Hatching Factor (Dr. C. Ellenby and A. B. Gilbert), 1105
Activity (Catalase), of Dog Erythrocytes: Genetically-controlled Differences in (Dr. A. C. Allison and W. ap Rees, and G. P. Burn), 649
Activity (Choline-Oxidase), of Host-Livers of Tumour-bearing Animals (M. V. Narurkar, U. S. Kumta and M. B. Sahasrabudhe), 1128
Activity (Fungistatic), of some Hydroxamic Acids (Dr. J. Alkiewicz, Dr. Z. Eckstein, Miss H. Halweg, Dr. P. Krakówka and Prof. T. Urbański), 1204
Activity (Growth-promoting): Lack of, of Inactivated Penicillin with Turkey Poults (J. R. Jowsey, F. D. Cook, H. L MacGregor and R. M. Blakely), 923
Activity (Narcotic), of Optical Enantiomorphs of Methylpentynol (J. R. Hickman and Dr P. G. Marshall), 1053
Activity (Phagocytic), of the Reticulo-Endothelial System: Effect of Experimental Biliary Obstruction on the (B. N. Halpern, G. Biozzi, Prof. T. Nicol and D. L. J. Bilbey), 503
Activity (Ribonuclease), and Ribonucleic Acid Content: Relation between (L Ledoux, A. Pileri, F. Vanderhaeghe and S. Brandli), 1048
Activity (Serological), of Ovalbumin irradiated with Gamma-Rays: Role of Structural Degradation in the Loss of (Hugo Fricke, Charles A. Leone and Wendell Landmann), 1423
Activity (Spermicidal): The Biochemical Basis of (Dr. T. Mann), 1027
Activity (Xanthine Oxidase), during Mammary Carcinogenesis in Mice (I Lewin, R. Lewin and R. C. Bray), 763
Activity and Specificity of Rennin (J. C. Fish), 345
Acton Society Trust: Size and Morale, Part 2, 694
Ada, G. L., and others: Infectivity of Influenza Virus Filaments, 1134
Ada, G. L. (Dineen, Dr. J. K., and): Rapid Extraction with Ethyl Acetate of Free Fluorescein Derivatives from Fluorescein *iso*Cyanate-Globulin Conjugates, 1284

Adam, Prof. N. K. : Distinguished Thermodynamics, *review*, 673
  Use of the Term 'Young's Equation' for Contact Angles, 809
Adam, Dr. W. B. : Quality Control of Food (Statistical Methods in Routine Control by Fruit and Vegetable Canners), 1326
Adams, Dr. C. E. : An Attempt to cross the Domestic Rabbit (*Oryctolagus cuniculus*) and Hare (*Lepus europaeus*), 853
Adams, Dr. G. K., and others : Initiation and Growth of Explosion in Solids (Ignition of Primary Explosives by Electric Discharges), 74
Adams, R. D. : Geophysical Investigations made in the Atlantic from R.R.S. *Discovery II* in 1956, 11
  Exploration of the Deep Ocean Floor, 778
Adaptive Radiation of Trapdoor Spiders (Barbara Main), 277
Addison, W. G. : Appointed agricultural officer, Western Nigeria, 1454
Additional Purine Compounds in the Venom of the Tiger Snake (*Notechis scutatus*), (Hazel M. Doery), 799
Adelberg, Prof. Edward A., and others : The Microbial World, *review* by Dr. A. T. R. Mattick, 519
Adenosine Triphosphate : Relationship between the Hydrolysis of, and Oxidative Phosphorylation (W. C. Hulsmann and Prof. E. C. Slater), 372
Adenosine Triphosphoric Acid : The Free Energy of Hydrolysis of (G. E. Vladimirov, V. G. Vlasova, A. Y. Kolotilova, S. N. Lyzlova and N. S. Pantereyeva), *erratum*, 363
Adenovirus Particles : Polyhedral Shape of, as shown by Electron Microscopy (Dr. R. C. Valentine and Dr. P. K. Hopper), 928
Adenovirus Type 5 : Latent Infection of Rabbits by (Dr. H. G. Pereira and Barbara Kelly), 615
Adiabatic Piezo-Optic Coefficient of Heavy Water (Dr. C. K. Narayanaswamy, P. S. Narayanan and Prof. R. S. Krishnan), 497 ; *erratum*, 953
Adkinson, Dr. B. W. : Appointed head of the Office of Scientific Information of the National Science Foundation, 1237 ; work of, 1237
Administration : International, 932
  Vitality in (Herbert Morrison, Basil Smallpeice, Sir Alexander Fleck, Sir Wilfrid Neden, A. D. Bonham-Carter and Major-General G. N. Russell), 153
Administration of Reserpine : Effect of Prolonged, on the Endocrine Glands of the Rat (Prof. O. Eranko, V. Hopsu, E. Kivalo and A. Telkka), 1130
Administration (International) : Reflections on (A. Loveday), 933
Administration (Post-Irradiation), of Methionine : Influence of, on the Levels of Deoxyribonucleic Acid in Bone Marrow, Spleen and Liver of Rats (M. K. Nerurkar, A. J. Baxi, N. S. Ranadive, M. V. Narurkar and M. B. Sahasrabudhe), 193
Administration and Law : The Economics of Nuclear Power including (edited by J. Guéron, J. A. Lane, I. R. Maxwell and J. R. Menke), Vol. 1, *review* by C. A. Rennie, 673
Administrative Tribunals and Enquiries : Report of the Committee on, 819
  House of Commons Debate on, 1178
Administrator : The Making of an (edited by A. Dunsire), 153
Admission to Universities : Report of an Inquiry into Applications for (R. K. Kelsall), (Committee of Vice-Chancellors and Principals of the Universities of the United Kingdom), 299
Adrenal Cortex : Control of the Humoral Factors of the Zona Glomerulosa of the (A. Nagy, A. Olah and Prof. S. Karady), 1481
Adrenal Gland : Secretion of Progesterone by the (Dr. W. E. Balfour, Dr. R. S. Comline and R. V. Short), 1480
Adrenal 11β-Hydroxylation by Ions : Inhibition of (Dr. Gordon M. Tomkins and Patricia J. Michael), 337
Adrenalectomized Rats (Normal and) : Influence of Starvation and Glucose Load on the Activity of Liver Phosphorylase in (Dr. N. Schwartz Sorensen), 857
Adrenalin and Nor-Adrenalin : Use of a Histochemical Technique to demonstrate the Cutaneous Penetration of (Dr. G. H. Bourne), 1488
Adrenaline and Failure of Neuromuscular Transmission (K. Krnjević and R. Miledi), 814
Adrian, Lord : The Analysis of the Nervous System (First Sherrington Memorial Lecture of the Royal Society of Medicine), 1028
Adsorbent (Cellulose Cation Exchange) : Chromatography of Tobacco Mosaic Virus on a (Prof. George W. Cochran, John L. Chidester and Deyna L. Stocks), 1281
Adsorption of Water on Tungsten (R. J. Hill and P. W. M. Jacobs), 1117
Adsorption (Liquid—Liquid Interface) : Chromatography by Liquid—Liquid Partition and (H. van Duin), 1473
Adsorption (Phage) : Role of Cations in, to Sensitive Bacteria (J. Beumer, J. Dirkx and M. P. Beumer-Jochmans), 83
Adult Emergence of *Pseudosarcophaga affinis* (Fall.) : Effects of Nucleic Acids on Larval Growth, Pupation and (H. L. House and J. S. Barlow), 44
Adult Indian Mackerel, *Rastrelliger kanagurta* (Cuv.) : Differences in the Food of the Young and the (K. V. Narayana Rao and Dr. K. Pampapathi Rao), 711
Adult and Foetal Myoglobin of the Cow : Amino-Acid Composition of (R. Timmer, H. J. van der Helm and Dr. T. H. J. Huisman), 239
Adulteration (Oil) : Identification of Edible Oils and the Detection of, by Differential Infra-red Spectroscopy (J. C. Bartlet), 1071
Advanced Research : Helen Putnam Fellowship for (Harvard University), 738
Advanced Study in the Behavioral Sciences, Center for (Stanford, California) : Conference on Ethology and Comparative Psychology, 362
Advanced Technology : Colleges of, 315
  Courses in (London and Home Counties Regional Advisory Council for Higher Technological Education), 635
Advancement of Education, Fund for the, and others : Programme to improve the quality of Physics taught in American Schools and Colleges, 1452
Advances in the Chemistry of Terpenoid Compounds : Recent (Chemical Society Symposium on), 470
Advances in Gelatin and Glue Research : Recent (British Gelatine and Glue Research Association Conference on), 690
Advances in Geophysics (edited by H. E. Landsberg), Vol. 3, *review* by Dr. S. H. Hall, 258
Advances in High Polymer Physics : Recent (Dr. A. S. Lodge), 75
Advances in the Identification of Leuco-Anthocyanins and the Chemistry of Condensed Tannins : Some Recent (Dr. David G. Roux), 973
Advances in Invertebrate Physiology : Recent—a Symposium sponsored by the National Science Foundation, the Tektronix Foundation and the University of Oregon (edited by Bradley T. Scheer), *review* by Prof. V. B. Wigglesworth, 1309
Advances in Nuclear Physics, *review* by Dr. T. G. Pickavance, 2
Advances in Science : Recent—Physics and Applied Mathematics (edited by Prof. Morris H. Shamos and Prof. George M. Murphy), *review* by G. R. Noakes, 206
Adventures : Near-Eastern, *review* by M. C. Burkitt, 1154
Adventures in the Nearest East (Prof. Cyrus H. Gordon), *review* by M. C. Burkitt, 1154
Advice on Careers (National Union of Teachers, Pamphlet on), 530
Advisory Council on Scientific Policy : Annual Report (1956–1957), 1075
Aedes aegypti : Variation in the Time of Release of the Ovarian Development Hormone in (Dr. J. D. Gillett), 656
Aerated Potato Disks : Respiratory Metabolism of (Nona Calo, Joy Marks and J. E. Varner), 1142
Aerobacter aerogenes : Relationship between the Concentration of Anionic Surface-active Agents and the Electrophoretic Mobility and Viability of (Dr. D. E. E. Loveday and Dr. A. M. James), 1121
Aerodynamic Drag of Perforated Plates (J. R. D. Francis and P. Minton), 702
Aeronautical Conference : Sixth Anglo-American (Royal Aeronautical Society and the United States Institute of the Aeronautical Sciences), 413
Aeronautical Research and Development, Advisory Group for : Seventh General Assembly, 737
Aeronautical Sciences, United States Institute of the (Royal Aeronautical Society and the) : Sixth Anglo-American Aeronautical Conference, 413
Aeronautical Society, Royal, and the United States Institute of the Aeronautical Sciences : Sixth Anglo-American Aeronautical Conference, 413
Aerosols (Bacterial) : An Effect of Hexylresorcinol on (H. M. Darlow and E. O. Powell), 1425
Affect : A Reconsideration of, *review* by Dr. Clifford Allen, 936
Affected Tissues of Leprosy Patients : Autoradiographic Detection of Sulphone in the (R. K. Poddar and Dr. K. R. Chatterjee), 854
Afforestation of Catchment Areas : Effect of the, upon Water Yield (Dr. P. J. Rennie), 663
Africa (Central) : Research in, 837
Africa (East) High Commission : Appointment of A. Rogerson as senior scientific officer, East African Veterinary Research Organization, 21
  Appointment of J. M. B. Harley as senior scientific officer, 21
  Appointment of C. M. Leslie as scientific officer, East African Industrial Research Organization, 220
  Appointment of W. N. Scott as deputy director, East African Trypanosomiasis Research Organization, 413
  Report for 1956 of the East African Agriculture and Forestry Research Organization, 786
  Appointment of R. M. C. Williams as senior scientific officer, 1098
  Appointment of D. J. L. Casley as statistician, 1098
  Appointment of J. A. Channon as senior meteorologist, East African Meteorological Department, 1454
Africa (South) : Academic Freedom in, 686, 1163
  Swedish Exploration in, *review* by Prof. O. Lowenstein, 56
  University Apartheid in (International Committee on Science and Freedom in co-operation with the Association of University Teachers Meeting on), 686, 1163
Africa (Southern) : Eels in (R. A. Jubb), 47
  The Freshwater Eel *Anguilla obscura* Gunther, 1871, in (R. A. Jubb), 1216
African (East) Agriculture and Forestry Research Organization : Report for 1956, 786
African (East) Dwarf Goat : Effect of Contrasted Planes of Nutrition on the Carcass Composition of the (Dr. P. N. Wilson), 145
African (East) Industrial Research Organization : Appointment of C. M. Leslie as scientific officer, 220
African (East) Meteorological Department : Appointment of J. A. Channon as senior meteorologist, 1454
African (East) Trypanosomiasis Research Organization : Appointment of W. N. Scott as deputy director, 413
African (East) Veterinary Research Organization : Appointment of A. Rogerson as senior scientific officer, 21
African (South) Animal Life—Results of the Lund University Expedition in 1950–1951 (edited by Bertil Hanstrom, P. Brinck and Gustaf Rudebeck), Vols. 1–3, *review* by Prof. O. Lowenstein, 56
African (West) Cacao Research Institute, Ibadan, Federation of Nigeria : Appointment of T. W. Tinsley as deputy director, 21
  Appointment of C. K. H. Martini as plant pathologist, Western Region, 413
African (West) Cocoa Research Institute, Ghana : Appointment of A. A. Brunt as plant pathologist, virologist, 21
After-Images : The Repetitive Property of the Human Brain as studied by the Electroencephalograph, and the Method of (Dr. Catherine Popov), 328
Age : Fractionation of Human Erythrocytes on the Basis of their (Ernest R. Simon and Yale J. Topper), 1211
Aged Male Rats : Effect of Prolonged Thyroid Administration on (Dr. Lloyd Glenn McArthur, Prof. John F. Lhotka and Dr. Arthur A. Hellbaum), 1123
Ageing : Psychological and Occupational Aspects of (British Association for the Advancement of Science, Section J (Psychology), Symposium on), 902
Ageing, British Society for Research on : Symposium on the Biology of Hair Growth, 592
Agent (Effective), for Eliminating *F*-factor in *Escherichia coli K*-12 : Acriflavine as an (Yukinori Hirota and Teiji Iijima), 655
Ages of Meteorites : Uranium, Helium and the (Dr. George W. Reed and Prof. Anthony Turkevich), 594
Agglutinability of Red Cells : Surface Alteration and the (Prof. Merwin Moskowitz and Saul Carb), 1049
Agglutinins (Immune Iso-Leuco-) : Identical Nature of the Leucocyte Antigens detectable in Monozygotic Twins by means of (J. Dausset and H. Brecy), 1430

INDEX

Agrell, Dr. I. P. S., and Wellin-Berger, Elsa : A Diurnal Cycle in the Mitotic Activity of Ascites Tumour Cells in Mice, 705
Agricultural Botany, National Institute for : Report for 1956, 726
Agricultural Bureaux, Commonwealth : Election of T. Swaminathan as chairman, 738
Agricultural Department, Northern Nigeria : Appointment of D., B. Roberts as irrigation engineer, 1454
Agricultural Economics, Centre for (Portugal) : Grant of £15,500 from the Calouste Gulbenkian Foundation, Lisbon, to establish and run the new Centre as part of the Foundation's own activities, 1027
Agricultural Research : Uses of Isotopes and Radiation in (Report of the First Meeting of the European Contact Group, Wageningen, 1956), (Food and Agriculture Organization of the United Nations), 275
Agricultural Research Council : Appointment of Elwyn Jones as a member, 21
  Appointment of Prof. T. A. Bennet-Clark and Prof. E. G. Cox as members, 585
  Re-appointment of Prof. P. B. Medawar as a member, 585
  Promotion of Dr. Helen K. Porter to Senior Principal Scientific Officer, 639
  Appointment of Prof. J. H. Gaddum as director of the Institute of Animal Physiology, 787
Agricultural Research and Teaching at Cambridge, Vol. I (University of Cambridge School of Agriculture), 227
Agricultural Society of England, Royal : Research Medal, 1171
Agricultural and Forestry Research in East Africa, 786
Agricultural and Horticultural Research Station, Long Ashton : Annual Report for 1956, 1400
  Retirement of Prof. T. Wallace as director, 267
  Appointment of Dr. H. G. H. Kearns as director, 585, 685
Agriculture at Cambridge (Dr. E. C. Humphries), 227
Agriculture at Newcastle-upon-Tyne, 1391
Agriculture : Endocrinological Problems in (Dr. I. W. Rowlands), 576
  The Role of, in British Economy (Sir James Turner), 486
  Use of Isotopes in (Dr. E. C. Humphries), 275
Agriculture, Fisheries and Food, Ministry of : Domestic Food Consumption and Expenditure, 1955—Annual Report of the National Food Survey Committee, 587
  Fishery Investigations, Series 2, Vol. 20, No. 11, On the Herring of the Southern North Sea (D. H. Cushing and A. C. Burd), 1330
Agriculture, Fisheries and Food, Ministry of, and the Scottish Home Department : Formation of a Committee of Inquiry into the Fishing Industry, 1171
Ainsworth, S. (Gibson, Prof. Q. H., and) : Photosensitivity of Haem Compounds, 1416
Air : Avoidance of Collision at Sea and in the—Collisions at Sea (Capt. F. J. Wylie), 213 ; Collisions in the Air (D. O. Fraser), 214
  Determination of Radon and Thoron in (G. B. Courtier), 382
  Electrostatic Charges on Spores of Fungi in (Prof. P. H. Gregory), 330
  Luminescence produced in, by Polonium-210 α-Particles (Prof. R. W. Nicholls and E. M. Reeves), 1188
  Oxidation of Pentane in Mixtures with, and the Negative Temperature Coefficient of Reaction (R. O. King, S. Sandler and R. Strom), 335
  Preferential Ionization of Argon in the Presence of, and its Application to Electric Discharge Devices (D. P. C. Thackeray), 913
l'Air au Congo Belge : Distribution conjointe de la température et de l'humidité de (Dr. F. Bultot), 219
Air Ministry : Organization of the Meteorological Office, 223
Air Ministry (Meteorological Office) : Geophysical Memoirs No. 99, Tornadoes in England, May 21, 1950 (H. H. Lamb), 966
Air Pollution : The Primary Sources of (Dr. R. Lessing), 637
Air Pollution and the Weather (Sir Graham Sutton), 637
Air Showers produced by High-Energy Cosmic Rays : An Experiment on (Dr. G. Clark, Dr. J. Earl, Dr. W. Kraushaar, Dr. J. Linsley, Dr. B. Rossi and Dr. F. Scherb), 353, 406
Air and Water Pollution—the Position in Europe and in the United States (European Productivity Agency of the Organization for European Economic Co-operation, Project Nos. 136 and 145), *review* by Dr. A. Parker, 451
Airborne and Shipborne Means : The Avoidance of Collision by (Institute of Navigation, l'Institut Français de Navigation and the Ausschuss fur Funkortung Joint Meeting on), 213
Aircraft (High-flying) : Some Observations of the Infra-red Solar Spectrum from a (J. T. Houghton, Dr. T. S. Moss, J. S. Seeley and T. D. F. Hawkins), 1187
Aircraft Establishment (Royal), Bedford (L. H. G. Sterne), 775
Aircraft Establishment, Royal : Appointment of P. A. Hufton as head of the Bedford Divisions, Aerodynamics Department, 787, 1095
  Promotion of Dr. D. Kuchemann to deputy chief scientific officer and appointment as head of the Supersonics Division of the Aerodynamics Department, 787, 1096
  Promotion of R. W. Pye to deputy chief scientific officer as head of the Trials Department, 1095
Aircraft Establishment, Royal (Staff of the) : Observations on the Orbit of the First Russian Earth Satellite, 937, *erratum*, 1028
Aitken, Dr. Robert : The University of Calcutta, *review*, 1152
Akabane, Kenji, and Hatanaka, Takeo : Polarization of Solar Radio Outbursts, 1062
Akheiser, A. I., and others : Low-Temperature Physics (Propagation of Sound in Ferro-magnetics), 462
Alanine : Conversion of Pyruvic Acid to, in the Silkworm Larva (T. Fukuda), 245
Alaskan Volcano in 1953 : Records from Table Mountain show clearly the increased Opacity of the Atmosphere arising from the (Report for 1955-56 of the Smithsonian Institution), 21
Alaskan Volcanoes : Investigations of (United States Geological Survey, Bulletin No. 1028), 19
Alberty, Prof. Robert A., and others : Experimental Physical Chemistry, fifth edition, *review* by Dr. E. F. G. Herington, 209
Albinism (Partial), in the Syrian Hamster (Roy Robinson), 443
Albino Rat : A Route for Intravenous Injection in the (Kenneth A. Pearce), 709
Albino Rats treated during the Embryonic or New-born Period with Rous Sarcoma Virus : Development of Multiple Cysts and of Haemorrhagic Affections of Internal Organs in (G. J. Svet-Moldavsky), 1299
Albino Strain of the Desert Locust (Philip Hunter-Jones), 236
Albon, N., and Dunning, Dr. W. J. : Growth of Sucrose Crystals, 1348
Albumin (Bovine Serum), and Ovalbumin : Liberation of Tyrosine Hydroxyl Groups in Urea Solutions of (A. N. Glazer, Dr. H. A. McKenzie and R. G. Wake), 1286
Alcohol : An Unsuspected Factor which Influences Consumption of, by Rats (R. J. G. Gillespie and Prof. C. C. Lucas), 1292
Aldermaston : Black and White Elephants at (Dr. T. E. Allibone), 1178
Aldoheptose Sugar (New) : Natural Occurrence of a (Dr. D. A. L. Davies), 1129
Aldoheptose Sugars : *Pasteurella septica*—the Occurrence of Type-Specific Polysaccharides containing (A. P. MacLennan and C. J. Rondle), 1045
Aldrich, Prof. Samuel R. (Worthen, Prof. Edmund L., and) : Farm Soils, fifth edition, *review* by Dr. A. M. Smith, 3
Alectoris rufa (Red-legged Partridge), and the Pheasant, *Phasianus colchicus* : *Sarcocystis* sp. in the (P. A. Clapham), 1294
Alekseevsky, N. E., and Gaidukov, Y. P. : Low-Temperature Physics (Resistance Minimum in Gold), 461
Alekseevsky, N. E., and others : Low Temperature Physics (Galvanomagnetic Properties of Bismuth, Tin and Aluminium), 461
Aleong, R. W. : Appointed deputy government chemist, Trinidad, 1454
Aleut Dentition—a Correlative Study of Dental Characteristics in an Eskimoid People (Dr. Coenraad F. A. Moorrees), *review* by F. Taylor Monks, 1380
Aleuts : Teeth of the, *review* by F. Taylor Monks, 1380
Alexander, Prof. A. E. : High Polymer, Colloid and Surface Chemistry (The Relation between Surface Mechanical Properties and Chemical Constitution of Linear Polymers), 959
Alexander, D. H. : *Obituary* of Atholl Blair, 783
Alexander, Prof. N. S., and Onwumechilli, C. A. : Variation of the Horizontal Force near the Magnetic Equator, 191
Alexander, Dr. R. A. : Elected a Fellow of the Royal Society of South Africa, 1025
Algae : The Red (1906-56 and After), (Dr. Kathleen M. Drew), 112
  X-Ray Interferences of Barium Sulphate in Fungi and (Dr. D. R. Kreger), 867
Algae (Green) : Effects of Oxygen upon Light Absorption by (Prof. Britton Chance and Bernard Strehler), 747
Algae (Marine), of the Northeastern Coast of North America (Prof. William Randolph Taylor), second edition, *review* by Prof. Lily Newton, 1268
Algebraic Transformations to a Normal Population, 219
Alikhanian, S. I., and Mindlin, S. Z. : Recombinations in *Streptomyces rimosus*, 1208
Alimentary Lipaemia and Resistance to Altitude Anoxia (Bedřich Mosinger and Eduard Kuhn), 1140
Alkali, Alkaline-Earth and other Metals : High-Voltage Paper Electrophoresis of Inorganic Cations— (Dr. D. Gross), 596
Alkali Chloride Crystals in the presence of Nucleoprotein Microfibrils : A Lattice Distortion of (J. C. White and P. C. Elmes, and V. Balashov, Prof. R. D. Preston and G. W. Ripley), 696
Alkaline-Earth and other Metals (Alkali,) : High-Voltage Paper Electrophoresis of Inorganic Cations— (Dr. D. Gross), 596
Alkaline Phosphatase during Paper Electrophoresis : Location of Alpha-2-Globulin by Demonstration of (Dr. William Quitman Wolfson), 550
Alkrewitz, Dr. J., and others : Fungistatic Activity of some Hydroxamic Acids, 1204
Alkyl-Methanesulphonates : Mutagenic Response to the, during Spermatogenesis in *Drosophila melanogaster* (Dr. O. G. Fahmy and Dr. Myrtle J. Fahmy), 31
Allan, Dr. D. A. : The Bristol Museum—Report for 1956, 795
Allan, Dr. J. F. : *Obituary*, 68
Allan, J. H. : Assessment of Mineral Content in Water-mounted Sections of Dental Enamel, 1130
  Mineralization of Human Enamel, 1362
Allanson, J. T., and Ross, Prof. Alan S. C. : Communication Theory, *review*, 255
Allanson, M., and others : Fixation of the Rabbit Pituitary Gland, 766
Allbrook, R. F. : Appointed soil survey officer, Western Nigeria, 1454
Allcroft, Ruth, and Lewis, Gwyneth : Trace Elements in Soils, Plants and Animals (Copper Nutrition in Ruminants), 25
Alldridge, M. G. : Appointed assistant geologist, British Guiana, 1098
Allen, Dr. Clifford : Dynamics of Divorce, *review*, 4
  The Mechanics of the Mind, *review*, 772
  A Reconsideration of Affect, *review*, 936
Allen, Frank W., and Mackinney, Gordon (edited by Luck, J. Murray, in association with) : Annual Review of Biochemistry, Vol. 26, *review* by Dr. Philip J. Randle, 1307
Allen, Dr. G. : Light-Scattering and Macromolecular Chemistry, *review*, 5
Allen, Dr. G., and others : Rheology of Elastomers (Elastic Recovery, Flow and Stress Relaxation), 76
Allen, H. H. : Detection of Inhomogeneities in Transparent Plastic Sheet by a simple Schlieren Technique, 50
Allen, J. E. (Reynolds, P., and) : Ionization Phenomena in Gases (Measurements of Electron- and Ion-Temperature), 793
Allen, K. W. : Ionization Phenomena in Gases (Condenser Discharge), 793
Allen, Dr. M. B., and others : Triphosphopyridine Nucleotide as a Catalyst of Photosynthetic Phosphorylation, 182, *errata*, 1325
Allen, P. D. : Appointed lecturer in mechanical engineering at the University of Birmingham, 738
Allen, Dr. P. W. : Block and Graft Copolymers, 536
Allen, Prof. R. G. D. : Mathematical Economics, *review* by Prof. D. G. Champernowne, 876
Allen, R. L., and Stone, Dr. F. S. : Nature of the Product condensed at Low Temperatures from Dissociated Peroxide Vapour, 752
Allen, T. K. : Ionization Phenomena in Gases (Irregular Helical Channels in Toroidal Discharges), 793
Allen and Co., Ltd., Edgar : Offer to the University of Sheffield to establish a postgraduate scholarship for study or research to be known as the Charles Kingston Everitt Memorial Scholarship, 21
Allergic Basis for Granuloma Formation in Man : Experimental Evidence for an (Dr. Walter B. Shelley and Dr. Harry J. Hurley), 1060
Allibone, Dr. T. E. : Peaceful Uses of Atomic Energy, *review*, 254
  Materials for Nuclear Engineering, 468
  Effects of Ionizing Radiation, *review*, 771
  Black and White Elephants at Aldermaston, 1178

Allin, P. W. M.: Appointed surveyor-general, Surveys Department, Northern Rhodesia, 21
Allison, Dr. A. C., and others: Genetically-controlled Differences in Catalase Activity of Dog Erythrocytes, 649
Allium cepa L.: Effects of Carbon Dioxide and Temperature on Stomata of (Midday Closure of Stomata), (Dr. O V. S. Heath and H. Meidner), 181
Alloxan: Sensitivity of Pancreas Hexokinase towards, and its Modification by Glucose (Dr. C. Villar-Palasi, Dr. A. Carballido, Dr. A. Sols and Dr J. L. Arteta), 387
Alloxan Diabetes in the Piglet (Dr. L. E Mount), 344
Alloys: The Constitutional Diagrams of (originally compiled by Dr. J. L. Haughton), second edition compiled by A Prince, *review* by A. R. Bailey, 352
  Vacancies and other Point Defects in Metals and (Metals Physics Committee of the Institute of Metals Symposium on), 893
Alloys (Palladium—Rhodium) Properties of (Dr. F. E. Hoare and J. Preston), 334
Alloys (Zirconium). Occurrence of the Meta-stable Omega Phase in (B. A. Hatt, J. A Roberts and G. I. Williams), 1406
Allsopp, H. J, and Roberts, J. P: Excess Zinc in Zinc Oxide, 603.
Allwood, Dr. R J.: Appointed temporary lecturer in civil engineering at the University of Birmingham, 738
Alpern, B, and others: At the Second International Conference on Coal Science (Properties, or the Thermal Decomposition Products, of Maceral Concentrates), 418
α-Amino-Acids and Amines: Differentiation of, by Non-Enzymatic Transamination on Paper Chromatograms (Dr. G. D Kalyankar and Prof. Esmond E. Snell), 1069
α-Cells of the Pancreas: Effect of Hypoglycin A on the (Dr. P. C. Feng), 855
α-Cellulose (Jute): Examination of the Oligosaccharides isolated from (W. G. Macmillan, A. B Sen Gupta and A S. Dutt), 1041
α-2-Globulin: Location of, by Demonstration of Alkaline Phosphatase during Paper Electrophoresis (Dr. William Quitman Wolfson), 550
α-Ketoglutarate in Virus-infected Mouse Brain: Metabolism of Pyruvate and (P. L. Bradley), 1418
α-Melanocyte-stimulating Hormone: Amino-Acid Sequence of the (Dr. J Ieuan Harris and Dr. Aaron B. Lerner), *erratum*, 316
α-Particles (Polonium-210): Luminescence produced in Air by (Prof. R. W. Nicholls and E M. Reeves), 1188
Alstrom, Bjorn, and others: Discovery of Element 102, 120
Alteration (Surface), and the Agglutinability of Red Cells (Prof. Merwin Moskowitz and Saul Carb), 1049
Alterations in Feline Behaviour following Bilateral Amygdalectomy (P. J. Morgane and Prof. A. J. Kosman), 598
A C. Switchgear (Dr. J. R. Mortlock), Vol. 1, A Survey of Requirements, *review* by Dr. J. S Forrest, 1379
Altitude Anoxia: Alimentary Lipaemia and Resistance to (Bedřich Mosinger and Eduard Kuhn), 1140
Altitude (High-) Rocket Experiment, 951
Aluminium: Structure of Non-porous Anodic Films on (R. W. Franklin), 1470
Alvarenga Prize for 1957 awarded to Prof. W. C. Stadie by the College of Physicians of Philadelphia, 270
Amaldi, Prof. E.: Elected president of the Executive Committee of the International Union of Pure and Applied Physics, 1324
Ambrose, Dr. E. J, and others: A Cell Compressor for the Measurement of Mass and Concentration by Interference Microscopy, 1487
Amenities, Rights of the Individual and the Needs of Development, 819
America (North): Marine Algae of the Northeastern Coast of (Prof. William Randolph Taylor), second edition, *review* by Prof. Lily Newton, 1268
America (South): Travels in, *review* by Dr G. H. S. Bushnell, 1443
American Arbacia and other Sea Urchins (Ethel Browne Harvey), *review* by Dr. D. B Carlisle, 1268
American Association for the Advancement of Science: Meeting in Indianapolis, 467, 1098
American Association for the Advancement of Science, and others: Symposium on Tranquilizing Drugs, presented at Atlanta, 1955 (arranged and edited by Harold E. Himwich), *review* by Dr. Marthe Vogt, 304
American Association of Physics Teachers, and others: Programme to improve the quality of Physics taught in American Schools and Colleges, 1452
American Chemical Society: Monograph Series No. 131, The Chemistry of the Coordination Compounds (edited by John C. Bailar, Jr.), *review* by Dr. R J. Magee, 725
American Institute of Physics: First Compton Gold Medal conferred on Dr. G. B Pegram, 836
American Institute of Physics, and others: Programme to improve the quality of Physics taught in American Schools and Colleges, 1452
American Mathematical Society, and others (sponsored by): Transactions of the Symposium on Partial Differential Equations held at the University of California, 1955 (edited by N. Aronszajn, A. Douglis and C B. Morrey, Jr), *review* by Dr. L. S. Goddard, 58
American Physical Society, and others: Programme to improve the quality of Physics taught in American Schools and Colleges, 1452
American Physicians, Association of: George M. Kober Medal awarded to Dr. Richard E. Shope, 363
American Physiological Society, and others: Symposium on Tranquilizing Drugs, presented at Atlanta, 1955 (arranged and edited by Harold E. Himwich), *review* by Dr. Marthe Vogt, 304
American Psychiatric Association, and others: Symposium on Tranquilizing Drugs, presented at Atlanta, 1955 (arranged and edited by Harold E. Himwich), *review* by Dr. Marthe Vogt, 304
American Schools and Colleges: Physics taught in (American Institute of Physics, in collaboration with the American Association of Physics Teachers, the American Physical Society, the Fund for the Advancement of Education, and the National Science Foundation, Programme to improve the quality of), 1452
American Studies Fellowships (Commonwealth Fund, New York), 585
American (Anglo-) Relations in the Nuclear Age, 1305
American (North) Butterflies: Experimental Studies of Mimicry in some (Mrs. Jane Van Zandt Brower), 444
Amine Oxidase in Horse Serum: Occurrence of an (Bernadette Bergeret, Dr. Hermann Blaschko and Rosemary Hawes), 1127
Amines: Differentiation of α-Amino-Acids and, by Non-Enzymatic Transamination on Paper Chromatograms (Dr. G D. Kalyankar and Prof. Esmond E. Snell), 1069
Amino-acid: Sites of the Incorporation of an, into Proteins of *Bacillus megaterium* (Dr. G. D. Hunter, Dr. A. R. Crathorn and Prof. J. A. V. Butler), 383
Amino-Acid Composition of Adult and Foetal Myoglobin of the Cow (R. Timmer, H. J. van der Helm and Dr. T. H. J. Huisman), 239
Amino-Acid Composition of the Six Histones of Calf Thymocytes (Dr. H. J. Cruft, J. Hindley, Dr. C. M. Mauritzen and Dr. E. Stedman), 1107
Amino-Acid Sequence of the α-Melanocyte-stimulating Hormone (Dr. J. Ieuan Harris and Dr. Aaron B. Lerner), *erratum*, 316
Amino-acids: A Non-Destructive Technique for Locating (E. R. Cook and M Luscombe), 708
Amino-Acids on Paper Chromatograms: A Rapid Procedure for the Separation of (Henry R. Roberts and Michael G. Kolor), 384
Amino-Acids (Aromatic): Non-specific Hydroxylation of, by an Insect Cuticle (Prof R. Dennell), 1070
Amino-Acids (Free), in Tomato: Molybdenum Nutrition and (J. V. Possingham), 363
Amino-Acids and Amino-Sugars: Cell-Wall (Dr. M R. J. Salton), 338
α-Amino-Acids and Amines: Differentiation of, by Non-Enzymatic Transamination on Paper Chromatograms (Dr. G. D. Kalyankar and Prof. Esmond E Snell), 1069
γ-Aminobutyric Acid and Arginine: Biosynthesis of γ-Guanidinobutyric Acid from (John J. Pisano, Chozo Mitoma and Sidney Udenfriend), 1125
2-Amino-2-Deoxy-D-Altrose: Characterization of (Dr A. B. Foster, Prof. M. Stacey and S. V. Vardheim), 247
2-Aminoethanesulphinic Acid: Isolation of, from a Mollusc (Shun'ichi Shibuya and Shunji Ouchi), 549
2-Amino Hexoses: Separation of Talosamine from other (Dr. M J Crumpton), 605
4-Amino 5-Imidazole Carboxamide: Utilization of, in Plant Tissues (Prof. K. V Giri and P. R. Krishnaswamy), 1427
β-Amino-Propionitrile in the Chick Embryo: Teratogenic Effects of (Ellis E. Rosenberg), 706
Amino-Sugars: Cell-Wall Amino-Acids and (Dr. M. R. J. Salton), 338
Amis, Prof. E S: Solvent Effects and Reaction Mechanism, 535
Ammonium Reineckate: Determination of Papaverine and Narcotine by using (Dr. Lee Kum Tatt and Dr Charles G. Farmilo), 1288
Amoeba to Man: Seeds of Life—the Story of Sex in Nature from the (John Langdon-Davies), *review* by T. H. Hawkins, 159
Amoebae (Soil), in Sterile Liquid Medium: A Technique for Obtaining Clone Cultures of (D. Harrison), 1301
Amor, Dr. A J.: Safety in the Chemical Industry (Medical Aspects of Safety in the Chemical Industry), 1399
Amoroso, Prof E. C, and others: Congenital Porphyria in Bovines—First Living Cases in Britain, 230
Amos, Dr A. J.: Quality Control of Food, 1327
'Amphioxides' Larva: The Problem of the (Quentin Bone), 1462
Amplifiers: Magnetic, *review* by D. F. Walker, 622
Amplifiers (Magnetic): Transductors and (Dr. A. G. Milnes), *review* by D. F. Walker, 622
Amputation (Stylar): Successful Crossing in the Genus *Lathyrus* through (A. J. S Davies), 612
Amygdalectomy (Bilateral): Alterations in Feline Behaviour following (P. J. Morgane and Prof. A. J. Kosman), 598
Amylase (Bacterial): Effects of Carbon Sources and Base Analogues of Nucleic Acid on the Formation of (Juichiro Fukumoto, Takehiko Yamamoto and Daisuke Tsuru), 438
Amyloid (*Tamarindus*-): Partial Enzymic Degradation of (Dr. P. Koolman), 201
Anaemias (Familial Haemolytic): Red-Cell Survival in (Dr. Robert L. Evans), 1435
Anaerobes: Infection by, *review* by Prof. R. Knox, 1152
Anaérobies: Biologie des Maladies dues aux (A. R. Prévot), *review* by Prof. R. Knox, 1152
Analogues. Effect of, on the Uptake of Vitamin B_{12} by the Intact Rat (Dr. A. L. Latner and Dr. Laureen Raine), 1197
Analogues (Base), of Nucleic Acid: Effects of Carbon Sources and, on the Formation of Bacterial Amylase (Juichiro Fukumoto, Takehiko Yamamoto and Daisuke Tsuru), 438
Analysers: Multichannel Pulse Height—Proceedings of an Informal Conference, Gatlinburg, Tennessee, 1956 (edited by H. W. Koch and R W. Johnston), *review* by Dr. Denis Taylor, 1381
Analysis. Art and (Prof Edward G Bullard), *review* by F. I. G. Rawlins, 1267
  Crystallochemical, *review* by Dr. F. C Phillips, 821
  Economic (Prof. Edmund Whittaker), *review* by Prof Gilbert Walker, 1441
  Organic (edited by John Mitchell, Jr., I. M Kolthoff, E S. Proskauer and A. Weissberger), Vol 3, *review* by Dr. W. J. Hickinbottom, 567
  Polarographic Wave (Dr. D. C. Munro), 540
  Quantitative Chemical (Cumming and Kay), eleventh edition revised by Dr. Robert Alexander Chalmers, *review* by Dr K Feild, 109
  Quantitative Chemical (Prof. Robert B. Fischer), *review* by G. Fowles, 676
  Semimicro Qualitative Organic (Prof Nicholas D. Cheronis and Prof. John B. Entrikin), second edition, *review* by Dr. W. J. Hickinbottom, 567
  Vector (Prof. Louis Brand), *review* by Dr. A W. Gillies, 824
  Volumetric (G Fowles), revised edition, *review* by A C. Cavell, 676
Analysis of Bistable Multivibrator Operation—the Eccles-Jordan Flip-Flop Circuit (P. A Neeteson), *review* by Dr. R. L. Smith-Rose, 401
Analysis of Hydrocarbons by Gas-Liquid Chromatography: High-Efficiency Columns for the (R P W. Scott and J. D. Cheshire), 702
Analysis of the Nervous System (Lord Adrian), 1028
Analysis (Ionophoretic and Chromatographic), of Single Dust Particles (B. M Turner), 1472
Analysis (Modern Organic): An Introduction to (Sidney Siggia and Hans J. Stolten), *review* by Dr. G M. Bennett, 6
Analysis (Qualitative Organic Chemical): A Guide to (Prof. R P. Linstead and Dr. B. C. L Weedon), *review* by Dr. W. J. Hickinbottom, 567
Analysis (Rotational), of the Tantalum Oxide Bands (D Premaswarup and Dr. R F. Barrow), 602

Analysis (Statistical), of a Random, Moving Surface (Dr. M. S. Longuet-Higgins), 228
Analysts (Public), Association of, and the Food Group of the Society of Chemical Industry : Joint Discussion on Quality-Control of Food, 1326
Analytical Chemistry, Society for (Midlands Section and Microchemistry Group) : Symposium on Microchemistry, 72
Analytical Chemistry, Society for (Scottish Section) : Congress on Modern Analytical Chemistry in Industry, 366
Analytical Chemistry, Society for, and others : Joint Discussion on the Control of Chemical Additives in Food, 692
Analytical Chemistry (Modern), in Industry (Scottish Section of the Society for Analytical Chemistry Congress on), 366
Anaphylactic Shock : 5-Hydroxytryptamine and (Dr. R. K. Sanyal and Dr. G. B. West), 1417
Anaphylaxis (Uterine), in Guinea Pigs sensitized with Homologous Testis or Sperm : *In vitro* Demonstration of (Dr. Seymour Katsh), 1047
Anatomy at Emory University, Georgia, 169
Anatomy of *Polystoma integerrimum* (Joan B. Williams), 866
Ancient Plant Remains : Difference in the Behaviour of Tissues in, and during Chemical Treatment (K. A. Chowdhury, S. S. Ghosh, R. V. Bhat and G. M. Vyas), 612
Anderson, Sir David : Education and Training for the Engineering Industry (Presidential Address to Section G (Engineering), of the British Association for the Advancement of Science), 482
Anderson, D. G : Vacuum Deposition of Metals (Chemical Bonds formed between Metal Films and a Silica or Glass Substrate), 124
Anderson, Duwayne M., and Low, Prof. Philip F. : Density of Water adsorbed on Wyoming Bentonite, 1194
Anderson, Dr. E. S. : Fluorescence Microscopy in the Study of Nucleic Acids—Visual Observation of Deoxyribonucleic Acid Changes in Bacteria during Growth of Bacteriophage, 1336
Anderson, G. : Nucleic Acid Derivatives in Soils, 287
Andrade, Prof. E. N. da C. : Appointed by the Royal Society to deliver the Rutherford Memorial Lecture for 1957, 119
  An Approach to Modern Physics, *review* by Prof. M. H. L. Pryce, 156
Andreasen, E. : Behaviour and Fate of Lymphocytes (The Thymus in the Production of Lymphocytes), 1016
Andreev, Prof. K. K. : Initiation and Growth of Explosion in Solids (Some Considerations on the Mechanism of Initiation of Detonation in Explosives), 73
Andrewes, Dr. C. H. : Latent Virus Infections, 788
  Obituary of Dr. Charles Todd, 1024
Andronikashvili, E. L. : Low-Temperature Physics (Oscillation Experiments in Rotating Liquid Helium), 461
Aneityum Island, New Hebrides : Biogeographical Significance of (Miss L. E. Cheesman), 903
Anemone (Sea) : Identification and Distribution of 5-Hydroxytryptamine in a (A. P. Mathias, D. M. Ross and Dr. M. Schachter), 658
Anfinsen, C. B. : Protein Structure and Biological Activity, 833
'Angels' on Centimetric Radars caused by Birds (W. G. Harper), 847
Angiotonin : Effect of, on the Distribution of Sodium, Potassium and Water in the Rat (Prof. Sydney M. Friedman, Constance L. Friedman and Miyoshi Nakashima), 194
Angles (Contact) : Use of the Term 'Young's Equation' for (Prof. N. K. Adam), 809
Anglo-American Aeronautical Conference (Royal Aeronautical Society and the United States Institute of the Aeronautical Sciences), 413
Anglo-American Relations in the Nuclear Age, 1305
Anguilla obscura Gunther, 1871 (Freshwater Eel), in Southern Africa (R. A. Jubb), 1216
Animal : The Infant (British Association for the Advancement of Science, Sections I (Physiology and Biochemistry) and M (Agriculture), Joint Discussion on), 681
Animal Health Trust : Educational Awards for 1957-58, 412
Animal Life : South African—Results of the Lund University Expedition in 1950-1951 (edited by Bertil Hanstrom, P. Brinck and Gustaf Rudebeck), Vols. 1-3, *review* by Prof. O. Lowenstein, 56
Animal Sera : Starch-gel Electrophoresis of (Dr. A. L. Latner and Angel Habib Zaki), 1366
Animal Welfare, Universities Federation for : Summer School for undergraduates of all faculties, 172
Animals : Catechol Compounds in Rat Tissues and in Brains of different (Dr. K. A. Montagu), 244
  Movement of the Heart and Blood in (William Harvey), translated from the original Latin by Prof. Kenneth J. Franklin, *review* by Prof. F. J. Cole, 449
  Seven (Edna Johnson), *review*, 676
  Trace Elements in Soils, Plants and (Agriculture Group and the Bristol Section of the Society of Chemical Industry Symposium on), 23
Animals, Royal Society for the Prevention of Cruelty to : Pamphlet on Cleansing of Oil-polluted Birds, 1453
Animals oxidizing Glucose labelled with Carbon-14 and other Labelled Substances : Radioactivity of Blood Carbon Dioxide in (R. J. Robinson and Dr. R. V. Coxon), 1279
Animals Parasitic in Man (Dr. Geoffrey Lapage), *review* by Dr. C. A. Hoare, 1079
Animals and Man : Polymorphism in Plants, (Dr. E. B. Ford), 1315
Animals and Men : Instinctive Behaviour in, *review* by Dr. P. T. Haskell, 518
Animals (Tumour-bearing) : Choline-Oxidase Activity of Host-Livers of (M. V. Narurkar, U. S. Kumta and M. B. Sahasrabudhe), 1128
Animaux et de l'Homme ; l'Instinct dans le Comportement des (M. Autuori, M.-P. Bénassy, J. Benoit, R. Courrier, Ed.-Ph. Deleurance, M. Fontaine, K. von Frisch, R. Gesell, P.-P. Grassé, J. B. S. Haldane, Mrs. Haldane-Spurway, H. Hediger, M. Klein, O. Koehler, D. Lehrman, K. Lorenz, D. Morris, H. Piéron, C.-P. Richter, R. Ruyer, T.-C. Schneirla et G. Viaud), *review* by Dr. P. T. Haskell, 518
Anion Exchange Behaviour of Yttrium (Prof. Nobufusa Saito and Tatsuya Sekine), 753
Anion Exchange Chromatography and Molecular Size of Deoxyribonucleic Acid (Morton Rosoff, Giampiero di Mayorca and Aaron Bendich), 1355
Anionic Surface-active Agents : Relationship between the Concentration of, and the Electrophoretic Mobility and Viability of *Aerobacter aerogenes* (Dr. D. E. E. Loveday and Dr. A. M. James), 1121
Anisotropy of Sclerotinites (D. Chandra), 297
Annales de l'Institut Phytopathologique Benaki, Nouvelle Série, Vol. 1, No. 1, 1322
Annals of Physics, Nos. 1, 2 and 3, 635
Anner, Prof. G. E. (Everitt, Dr. W. L., and) : Communication Engineering, third edition, *review* by Prof. James Greig, 1080
Anniversary Lecture of the Society of Leather Trades' Chemists (K. B. Ross), 270
Annual Review of Biochemistry (edited by J. Murray Luck, in association with Frank W. Allen and Gordon Mackinney), Vol. 26, *review* by Dr. Philip J. Randle, 1307
Annual Variation of Sporadic Meteors : Theory of the (Tadayoshi Murakami), 1239
Anodic Films (Non-porous), on Aluminium : Structure of (R. W. Franklin), 1470
Anomalous Electrophoretic Behaviour : A New Haemoglobin Variant exhibiting (Rose G. Schneider and Mary Ellen Haggard), 1486
Anomiid (Saddle Oyster) : *Enigmonia aenigmatica* Sowerby, a Mobile (Prof. C. M. Yonge), 765
Anopheles sundaicus : Insecticide Resistance in (G. Davidson), 1333
Anoxia (Altitude) : Alimentary Lipaemia and Resistance to (Bedřich Mosinger and Eduard Kuhn), 1140
Anscombe, G. E. M., and others (edited by) : Remarks on the Foundations of Mathematics (Ludwig Wittgenstein), translated by G. E. M. Anscombe, *review* by F. I. G. Rawlins, 399
Antagonists (Reserpine) : 3,4-Dihydroxyphenylalanine and 5-Hydroxytryptophan as (Prof. Arvid Carlsson, Margit Lindqvist and Tor Magnusson), 1200
Antarctic : Physiological Expedition to the (Dr. L. G. C. E. Pugh), 683
Antarctic Continent : Elephant Seals on the (Susan E. Ingham), 1215
Antennae of Hemiptera : 'Compensatory Hyper-regeneration' in the (Prof. Alexander Wolsky), 1144
Anthocyanidins of *Lochnera rosea* (Dr. W. G. C. Forsyth and N. W. Simmonds), 247
Anthocyanins (Leuco-) : Some Recent Advances in the Identification of, and the Chemistry of Condensed Tannins (Dr. David G. Roux), 973
Anthony, Dr. H. D. : Science and its Background, third edition, *review* by W. L. Sumner, 1267
Anthropology at the Australian National University, 1237
Antibiotic from Maggots (E. R. Pavillard and Dr. E. A. Wright), 916
Antibiotic-Resistant Staphylococci : Origin of (J. C. Gould), 282
Antibody Production (*Leptospira*), by Bovine Foetuses (K. L. Fennestad and C. Borg-Petersen), 1210
Antigen (Organ-Specific) : Role of, during 4-Dimethylaminoazobenzene Carcinogenesis in the Rat Liver (P. E. Hughes, C. J. Louis, J. K. Dineen and W. G. Spector), 289
Antigen (A Protein), associated with Smooth Colony Forms of some Species of *Pasteurella* (Dr. M. J. Crumpton and Dr. D. A. L. Davies), 863
Antigens (Leucocyte), detectable in Monozygotic Twins by means of Immune Iso-Leuco-agglutinins : Identical Nature of the (J. Dausset and H. Brecy), 1430
Antihaemophilic Globulin : Inactivation of, by Thrombin (Dr. C. Rizza and Dr. W. Walker), 143
Antihypertensive Activity of Hexahydro-1-Azepinepropionamidoxime (Robert P. Mull, Robert A. Maxwell and Albert J. Plummer), 1200
Antimitotic Activity of 5-Tertiary Butyl Benzimidazolone (Dr. H. C. Stoerk, R. N. Arison and J. E. Hawkins, jun.), 1428
Antiquaries, Society of : Gift of the Stanwick Skull to the British Museum (Natural History), 1027
Antiquities, Department of (Federation of Nigeria) : Appointment of B. E. B. Fagg as director, 1454
Antitumour Effect of Culture Media from Tumour-immune Spleens (E. Holečková and Dr. B. Sekla), 1298
Apartheid and its threat to South Africa's Universities (Bulletin No. 9 of the International Committee on Science and Freedom), 686
Apartheid (University), in South Africa (International Committee on Science and Freedom in co-operation with the Association of University Teachers Meeting on), 686, 1163
Aphidoidea of the Middle East (Prof. F. S. Bodenheimer and Dr. E. Swirski), *review* by J. P. Doncaster, 1441
Apis mellifera L. : European Foul Brood—a Disease of the Larval Honeybee, caused by a Combination of *Streptococcus pluton* (*Bacillus pluton* White) and *Bacterium eurydice* White (L. Bailey), 1214
Apparatus and Techniques (Laboratory) : Exhibition of (Manchester College of Science and Technology), 1239
Apparel Fabrics : Flammability of, in relation to Domestic Burning Accidents (British Standards Institution), 1102
Apple Leaf Wax : Fungistatic Properties of (Defence Mechanism of Plants against Fungi), (Dr. J. T. Martin, R. F. Batt and R. T. Burchill), 796
Apple Seedlings : Vesicular-Arbuscular Mycorrhiza in (Dr. Lilian E. Hawker and Angela M. Ham), 998
Appleton, Sir Edward : The New Radio Research Station, Ditton Park, Slough, opened by, 163
Application to Electric Discharge Devices : Preferential Ionization of Argon in the Presence of Air and its (D. P. C. Thackeray), 913
Application of Science : Industry and Technical Progress—Factors Governing the Speed of (Prof. C. F. Carter and Prof. B. R. Williams), *review* by Dr. R. Beeching, 301 ; 305
Application to Scientific and Engineering Work : Digital Calculating Machines and their (G. A. Montgomerie), *review* by Dr. A. D. Booth, 823
Applications (Industrial), of Thermonuclear Reactions (British Association for the Advancement of Science, Section A (Mathematics and Physics), Discussion on), 780
Applied Arts and Sciences, Museum of (Sydney) : Annual Report for 1956, 1324
Applied Bacteriology, Journal of : Extra number containing the papers read at the Symposium on Bacterial Spores, 1098
Applied Biologists, Association of : General Meeting in the University of Leeds, 363
  General Meeting in the Imperial Institute, London, 1454
  Symposium on the Use of Insecticides for the Control of Virus Diseases, 1454
Applied Chemistry : Reports on the Progress of, Vol. 40, 1955 (edited by H. S. Rooke), *review* by Prof. J. R. Partington, 59
Applied Chemistry (Pure and), International Union of : Symposium on Geochemistry, 583

- Applied Chemistry (Pure and), International Union of (Macromolecular Commission): Tenth International Symposium on Macromolecular Chemistry, 841
- Applied Mathematics: Physics and (Recent Advances in Science), (edited by Prof. Morris H. Shamos and Prof. George M. Murphy), *review* by G. R. Noakes, 206
- Applied Morphogenesis, 1393
- Applied Physics (Electrical): Introduction to (Prof. N. F. Astbury), *review* by H. Kayser, 875
- Applied Physics (Pure and), International Union of: Ninth General Assembly, 1324
  - Election of the Executive Committee for 1957-60, 1324
- Approach to the Synthesis of Polycyclic Peptides (Dr. Dorothy Wrinch), 502
- Aqueous Solutions: Interaction between Organic Hydroxy Acids and Silicic and Germanic Acids in (E. R. Clark and J. A. Weddams), 904
  - Ultra-Violet Absorption Spectra of L-Ascorbic Acid in (Dr. J. S. Lawendel), 434
- Aquinas (St. Thomas): The Christian Philosophy of (Etienne Gilson), translated by L. K. Shook, *review* by the Very Rev. W. R. Matthews, 873
- *Arabidopsis*: Effect of Day-length and Gibberellic Acid on the Flowering of (J. Langridge), 36
- Arachin Molecule: The (C. W. Carter, W. E. F. Naismith, R. H. K. Thomson and G. R. Ure), 971
- Arambarri, P.: Awarded a Spanish Fellowship for 1957-58 by the Ramsay Memorial Trust, 316
- Arbacia and other Sea Urchins: The American (Ethel Browne Harvey), *review* by Dr. D. B. Carlisle, 1268
- *Arca noae*. Mucous Gland Cells of the Outer Mantle Epithelium of (E. R. Trueman), 1492
- Archaeology and the Bible, *review* by M. C. Burkitt, 1255
- Archaeology as Science—Purposes and Pitfalls (Prof. C. F. C. Hawkes), 483
- Architecture (New University): Exhibition of, at the University of London (University Architecture Exhibitions Committee and the Arts Council of Great Britain), 891
- Arctic: High—the Story of the British North Greenland Expedition (Mike Banks), *review* by Sir Raymond Priestley, 1258
  - Parasitology and the (Prof. T. W. M. Cameron), 267
- Arctic Expedition (Modern): Sidelight on a, *review* by Sir Raymond Priestley, 1258
- Areas of the Leaves of Crop Plants: Rapid Estimation of the (Dr. P. C. Owen), 611
- Arend-Roland (Comet). Polarization of (Dr. M. K. Vainu Bappu and Dr. S. D. Sinvhal), 1410
  - Radio Observations of the (G. R. Whitfield and J. Hogbom), 602
- Argent, Dr. B. B.: Appointed lecturer in metallurgy at the University of Sheffield, 21
- Argentine Atomic Energy Commission, and others: Symposium on the Physics of Elementary Particles, 412
- Arginine: Biosynthesis of γ-Guanidinobutyric Acid from γ-Aminobutyric Acid and (John J. Pisano, Chozo Mitoma and Sidney Udenfriend), 1125
- Argon in the Presence of Air: Preferential Ionization of, and its Application to Electric Discharge Devices (D. P. C. Thackeray), 913
- Arguimbau, L. B., and Stuart, R. D.: Frequency Modulation, *review* by Dr. R. L. Smith-Rose, 206
- Arison, R. N., and others: Antimitotic Activity of 5-Tertiary Butyl Benzimidazolone, 1428
- Arkhipov, R. G.: Low-Temperature Physics (Theoretical Considerations of the Helium Film), 461
- Arkhipov, R. G., and Khalatnikov, I. M.: Low-Temperature Physics (Phenomena to be expected when First or Second Sound passes through a Phase Boundary between Solutions of Helium-3 and Helium-4), 461
- Armstrong, D.: Dating of some Minor Intrusions of Ayrshire, 1277
- Armstrong, F. A. J.: Research in Marine Biology (Phosphorus and Silicon off Plymouth), 746
- Armstrong, J.: Appointed agricultural officer, Northern Rhodesia, 220
- Armstrong, Dr. J. A., and Niven, Dr. Janet S. F.: Fluorescence Microscopy in the Study of Nucleic Acids—Histochemical Observations on Cellular and Virus Nucleic Acids, 1335
- Arnold, Dr. A. H. M.: Hydro-electric Power in the U.S.S.R., 177
- Arnold, J. W.: Awarded a British Oxygen Fellowship for Postgraduate Research, 270
- Arnon, Prof. Daniel I., and others: Triphosphopyridine Nucleotide as a Catalyst of Photosynthetic Phosphorylation, 182, *errata*, 1325
- Aromatic Acids in Plant Tissues: Separation and Identification of, by Paper Chromatography (Dr. L. A. Griffiths), 286
- Aromatic Amino-Acids: Non-specific Hydroxylation of, by an Insect Cuticle (Prof. R. Dennell), 1070
- Aromatic Nitro Compounds: Group Localization Energy and Polarographic Half-wave Potentials of (Dr. Sadhan Basu and Jayanti Nag Chaudhuri), 1473
- Aronszajn, A., and others (edited by): Transactions of the Symposium on Partial Differential Equations held at the University of California, 1955, *review* by Dr. L. S. Goddard, 58
- Arrays with Constant Beam-Width over a Wide Frequency-Range (Prof. D. G. Tucker), 496
- Arrhenius, G., and others: Localization of Radioactive and Stable Heavy Nuclides in Ocean Sediments, 85
- Arsenic-75: Excited Levels in, produced by Radiative Capture of Protons by Germanium-74 (D. R. Chick and S. E. Hunt), 88
- Art and Analysis (Prof. Edward G. Ballard), *review* by F. I. G. Rawlins, 1267
- Art Galleries in Britain: Museum and, 769
- Artefact in Extracts of Immature Corn Kernels: Ethyl-3-Indoleacetate—an (Henry N. Fukui, JoAnne E. DeVries, S. H. Wittwer and Prof. H. M. Sell), 1205
- Artefacts (Stone), with *Australopithecus* at Sterkfontein: Occurrence of (Dr. J. T. Robinson and R. J. Mason), 521
- Arteriosclerosis: Etiology and Pathogenesis of (Prof. G. Lyman Duff), 267
- Arteta, Prof. J. L., and others: Sensitivity of Pancreas Hexokinase towards Alloxan and its Modification by Glucose, 387
- Arthropod Cuticles. Action of Diaphanol on (J. Kennaugh), 238
- Arthropod-borne Viruses. Use of Goose Cells in Haemagglutination Tests with (Dr. J. S. Porterfield), 1201
- Artificial Earth Satellite, 719, 734
  - End of the Rocket of the First, 1392
  - Life-time of an (J. A. Fejer), 1413
  - Observations at Jodrell Bank, 890
  - Orbit of the, 784
  - Photograph of the Track of the, 835
  - The Second, 931
- Artificial Earth Satellite (Russian): Observations of the, and their Analysis (Royal Society Discussion on), 953
  - Orbit of the Second, 1026
- Artificial Lighting (Natural and), in Museums (W. E. Rawson-Bottom and B. S. Cooper), 1323
- Artificial Meteors, 1168
- Arts, Royal Society of: Conference on Capital for Scientific Development, 307
  - Awards of Endowed Prizes for 1957, 891
- Arts Council of Great Britain (University Architecture Exhibitions Committee and the): Exhibition at the University of London of New University Architecture, 891
- Arts, Humanities and Social Sciences: The Canada Council for the Encouragement of the, 356
- Arts and Science: University Course in (Report of the General Board of the Faculties of the University of Cambridge), 173
- Aschaffenburg, R., and Drewry, J.: Genetics of the β-Lactoglobulins of Cow's Milk, 376
- Aschoff, J.: Biological Rhythms (Time in Biology), 1100
- Ascites Carcinoma Cells (Ehrlich): Effects of Sarcomycin on the Metabolism of (I. J. Bickis, Dr. E. H. Creaser, Prof. J. H. Quastel and Dr. P. G. Scholefield), 1109
- Ascites Tumour (Ehrlich): How does the, obtain its Energy for Growth? (A. Kemp and Prof. B. Mendel), 131
- Ascites Tumour Cells in Mice: A Diurnal Cycle in the Mitotic Activity of (Dr. I. P. S. Agrell and Elsa Welin-Berger), 705
- Ascorbic Acid Content of Baobab Fruit (Bruce M. Nicol), 287
- L-Ascorbic Acid: Missing Step in Man, Monkey and Guinea Pig required for the Biosynthesis of (Dr. J. J. Burns), 553
- L-Ascorbic Acid in Aqueous Solutions: Ultra-Violet Absorption Spectra of (Dr. J. S. Lawendel,) 434
- Ascorbic Acid Oxidase: Inhibition of, by Thiourea (Dr. A. M. Mayer), 1417
- Asexual Reproduction in Trilobites: Supposed (Dr. Henning Lemche), 801
- Ashby, Sir Eric: Humanities for the Technologist, 624
- Ashby, Ernest: Retirement as chief steward and technician in the Laboratory of Cryptogamic Botany of the University of Manchester, 1026; work of, 1026
- Ashrif, M. I.: Appointed agronomist, Sierra Leone, 1098
- Ashton, G. C.: Serum Protein Differences in Cattle by Starch Gel Electrophoresis, 917
- Ashton, J. Appointed senior surveyor, Northern Region, Nigeria, 220
- Asia Foundation in the United States: Gifts to science advisers in Burma, 269
- Aslib: Award of £10,000 from the United States National Science Foundation, for research into the comparative efficiency of various indexing and literature search systems, 217
  - Conference, 637
- Aso, K. (Sato, Prof. A., and): Kojibiose (2-0-α-D-Glucopyranosyl-D-Glucose)—Isolation and Structure, 984
- Aspects of the Language Problem: Scientific and Technical Translating and other (Unesco Report on), 1170
- Aspects of Micronutrient Element Metabolism in Plants: Some (Dr. E. J. Hewitt), 1020
- Aspects (Biological), of Cancer (British Association for the Advancement of Science, Section D (Zoology), Discussion on), 830
- Aspects (Fundamental), of Fibres and their Treatment for Papermaking (British Paper and Board Makers' Association Symposium on), 1175
- Aspects (Some Modern), of Enzyme Research, *review* by Prof. D. D. Woods, 1379
- Aspects (Occupational), of Ageing: Psychological and (British Association for the Advancement of Science, Section J (Psychology), Symposium on), 902
- Aspects and Problems of Conifer Embryology (Prof. J. Doyle), 485
- *Aspergillus niger*: Effect of Copper and Chelating Agents on Growth Inhibition of, by 8-Hydroxyquinoline and Pyridine-N-Oxide-2-Thiol (Dr. A. Kaars Sijpesteijn, M. J. Janssen and (in part) H. M. Dekhuyzen), 505
- Asquith, R. S., and others: Chemical Mechanism of Permanent Set, 502
- Assam: Classification of Citrus Fruits of (S. C. Bhattacharya and S. Dutta), 171
- Assay of Elementary Nitrogen: Mass-Spectrometric (Dr. J. B. Capindale and Dr. D. H. Tomlin), 701
- Assessment of Mineral Content in Water-mounted Sections of Dental Enamel (J. H. Allan), 1130
- Astbury, Prof. N. F. Introduction to Electrical Applied Physics, *review* by H. Kayser, 875
- Astor (William Waldorf) Foundation, New York: Cherwell Fellowship awarded to Dr. H. G. Kuhn, 1325
- Astronomer Royal: Report to the Board of Visitors of the Royal Greenwich Observatory (1956-57), 586
- Astronomical Society, Royal (Royal Meteorological Society and the): Joint Symposium on Planetary Atmospheres and Convection in Rotating Fluids, 1455
- Astronomical Union, International: Transactions of the (edited by P. Th. Oosterhoff), Vol. 9, Ninth General Assembly held at Dublin, 1955, *review* by Prof. R. O. Redman, 824
- Astronomy: International, *review* by Prof. R. O. Redman, 824
  - Robert Cormack Bequest Fellowship in, awarded to Miss Patricia R. R. Leslie by the Royal Society of Edinburgh, 122
  - Vistas in (edited by Dr. Arthur Beer), *review* by Prof. André Danjon, 1308
- Asymmetries in π-μ Decay: Spatial (Dr. J. M. Cassels), 1245
- 'Asynaptic' Locust: Distribution of Chiasmata in an (Dr. H. Rees), 559
- Atlantic. Geophysical Investigations made in the, from R.R.S. *Discovery II* in 1956 (Royal Society Discussion on), 10
- Atlantic (North) Treaty Organization: Seventh General Assembly of the Advisory Group for Aeronautical Research and Development, 737

- Atmosphere : Records from Table Mountain show clearly the increased Opacity of the, arising from the Alaskan Volcano in 1953 (Report for 1955–56 of the Smithsonian Institution), 21
- Atmospheres (Planetary), and Convection in Rotating Fluids (Royal Meteorological Society and the Royal Astronomical Society Joint Symposium on), 1455
- Atmospheric Electricity (Dr J Alan Chalmers), *review* by Dr B. J. Mason, 402
- Atmospheric Ozone A Possible Auroral Enhancement of Infra-red Radiation emitted by (Wallace B. Murcray), 139
- *Atmospheric and Terrestrial Physics, Journal of* : Special Supplement No. 3, Vistas in Astronomy (edited by Dr Arthur Beer), *review* by Prof. André Danjon, 1308
- *Atom*, No 7, 23, Bibliography on Atomic Energy (United Kingdom Atomic Energy Authority), 837
- Atom and the West . Russia, the (Prof. George F Kennan), 893
- Atomic Energy . Bibliography on, 837
  - Economics of (Mary Goldring), *review* by Dr. J. V. Dunworth, 1266
  - Peaceful Uses of (Proceedings of the International Conference on the, Geneva, 1955), Vol 1, The World's Requirements for Energy ; Vol 6, Geology of Uranium and Thorium, *review* by Dr. T. E. Allibone, 254 ; Vol. 7, Nuclear Chemistry and Effects of Irradiation ; Vol. 11, Biological Effects of Radiation, *review* by Dr. T. E. Allibone, 771
  - Peaceful Uses of (Second International Conference on the), 217
  - Progress in the Commercial Use of, 1096, 1451
- Atomic Energy, Norwegian Institute for (United Kingdom Atomic Energy Authority and the) Agreement for Co-operation in connexion with the Norwegian Halden Reactor Project, 361
- Atomic Energy Authority, United Kingdom Third Annual Report (1956–1957), 397
  - Appointment of Sir Leonard Owen as managing director of the Industrial Group, 529
  - Promotion of research workers, 639
  - Visits to the Dounreay establishment, 787
  - *Atom*, No. 7, 23, Bibliography on Atomic Energy, 837
  - Accident at Windscale (Prof. W. Murgatroyd), 1093
- Atomic Energy Authority (United Kingdom), and the Norwegian Institute for Atomic Energy : Agreement for co-operation in connexion with the Norwegian Halden Reactor Project, 361
- Atomic Energy Commission (Argentine), and others : Symposium on the Physics of Elementary Particles, 412
- Atomic Energy Developments : Collaboration between Britain and Norway in, 361
  - Responsibility for, 1097
- Atomic Energy Establishment at Windscale, 952
  - Accident at the (Prof W. Murgatroyd), 1093
- Atomic Energy Industry . Some Reflexions on the (K B Ross), 270
- Atomic Energy Office : Accident at Windscale No 1 Pile on October 10, 1957, 1093
- Atomic Energy Programme (Indian) : Economics of Atomic Power Development in India and the (Dr H. J. Bhabha), 1382
- Atomic Energy Research Establishment : Course on Isotopes in Industry, 122
  - PLUTO, Materials Testing Reactor at Harwell, 952 ; Construction of, 952
  - ZETA Apparatus for Controlled Thermonuclear Reactions, 1097, 1451
  - Courses at the Reactor School, Harwell, 1325
- Atomic Energy and its Biological Implications (Sir John Cockcroft), 64
- Atomic Explosions in Australia . Seismic Recordings of (H. A. Doyle), 132
- Atomic Patents : New, 784
- Atomic Physics : Plasma and (Physical Society Conference on), 531
- Atomic Physics (Theoretical), Nordic Institute for : Establishment of the, 1322
- Atomic Power Development in India : Economics of, and the Indian Atomic Energy Programme (Dr H J Bhabha), 1382
- Atomic Structures, *review* by Dr. R. J Eden, 822
- Atomic Structures : The Calculation of (Prof. Douglas R. Hartree), *review* by Dr R J Eden, 822
- Atomic War : Global, *review* by William Cooper, 350
- *Atoms for Peace Digest* : Vol. 3, No. 1, Brookhaven National Laboratory, 589
- Atoms as Units (Prof. Casimir), 1178
- Atrial Cellular Potentials : Effect of Acetylcholine and Quinidine on (Dr. Edward A Johnson and Dr P A. Robertson), 1483
- Attack : Point of, in Hydrocarbon Oxidation (R. Burt, F. B Ebeid and Dr G J. Minkoff), 188
- Attempt to detect Linearly Polarized Radio Emission from the Galaxy (J. M. Thomson), 495
- Attempt (An Experimental), to Determine the Site of the Neurohypophysial Osmoreceptors in the Dog (P. A Jewell and Prof E. B. Verney), 129
- Attempted Control of Ectromelia in a Mouse-breeding Colony (A. E. G. Pearson), 1300
- Atterling, Hugo, and others : Discovery of Element 102, 120
- Attractive Forces between Flat Plates (Dr. M. J Sparnaay), 334
- Auckland University College, New Zealand : Appointment of Dr D. R. Llewellyn as professor of chemistry, 69
- Auden, Jane, and others : Trace Elements in Soils, Plants and Animals (Soil Acidity Factors), 24
- Audio-frequency Nuclear-resonance Echoes (Dr. J G. Powles and D. Cutler), 1344
- Auerbach, Dr. C : Genetical Hazards of Radiations, 489
- Augier, Dr. J. Methods of Studying the Microbiology of Soils (Methods of Counting Soil Bacteria), 591
- Auroral Enhancement of Infra-red Radiation emitted by Atmospheric Ozone : A Possible (Wallace B. Murcray), 139
- Auroral Height Determination of, by Radar (R. S. Unwin and Dr. M. Gadsden), 1469
- Ausschuss fur Funkortung, and others : Joint Meeting on the Avoidance of Collision by Airborne and Shipborne Means, 213

Biological Synthesis : Thermodynamics of, *review* by Dr. Herbert Gutfreund, 207
Biological Systems : Efficiency of Ion Transport in (Dr. J. F. Sutcliffe and D. P. Hackett), 95
Biologically interesting Carboxylic Acids : A Convenient Method for labelling, with Tritium (N. P Buu-Hoï), 385
Biologically Synthesized Lactose labelled with Carbon-14 : Degradation of (Frederick J Carleton, Henry R Roberts and Leighton A. Nutting), 915
Biologie des Maladies dues aux Anaérobies (A B Prévot), *review* by Prof. R. Knox, 1152
Biologists (Applied), Association of General Meeting in the University of Leeds, 363
  General Meeting in Imperial College, London, 1454
  Symposium on the Use of Insecticides for the Control of Virus Diseases, 1454
Biology Physical Chemistry for Students of Pharmacy and (Dr. S. C. Wallwork), *review* by G Fowles, 1269
  Radiation (edited by Alexander Hollaender, with the co-operation of Sterling B Hendricks), Vol 3, Visible and Near-Visible Light, *review* by Dr Robert Hill, 108
  Radiation and (British Association for the Advancement of Science, Sections D (Zoology), I (Physiology and Biochemistry), K (Botany) and M (Agriculture), Joint Discussion on), 628
  Simple Investigations in, 687
Biology, Institute of : Annual Conversazione (Dr J. L. Cloudsley-Thompson), 319
  Symposium on the Biological Productivity of Britain, 531
  Formation of a Parasitology Group, 637
  International Symposium on Freezing and Drying, 838
Biology, Institute of (Parasitology Group) : Discussion on the Nature of Immune Responses in Parasitism, 637
Biology of Cancer, 830
Biology of Hair Growth (British Society for Research on Ageing Symposium on), 592
Biology of *Pandalus montagui* (—. Mistakidis), 892
Biology of the Salmon (British Association for the Advancement of Science, Section D (Zoology), Symposium on), 789
Biology of Yeast (British Association for the Advancement of Science, Sections B (Chemistry) and K (Botany), Joint Discussion on), 1161
Biology (Marine) . Researches in (John S. Colman), 745
Biometeorology, International Society for Bioclimatology and · First Congress (Dr. E. M. Glaser), 1328
Biophysical Techniques, *review* by Prof. J A. V. Butler, 1009

Biophysics Research at King's College, London, 891

Biosciences : Research in the—a Mid-Century Perspective (W. H. Cook), 267

Biosynthesis of L-Ascorbic Acid : Missing Step in Man, Monkey and Guinea Pig required for the (Dr. J. J. Burns), 553

Biosynthesis of γ-Guanidinobutyric Acid from γ-Aminobutyric Acid and Arginine (John J. Pisano, Chozo Mitoma and Sidney Udenfriend), 1125

Biosynthesis and Utilization (Methionine), in *Pseudomonas tabaci* and *Ps. angulata* (Prof. E. D. Garber and Susan G. Shaeffer), 1282

Biozzi, Dr. G. : Non-specific Immunity (Phagocytic Functions of the Reticulo-endothelial System), 640

Biozzi, Dr. G., and others : Effect of Experimental Biliary Obstruction on the Phagocytic Activity of the Reticulo-Endothelial System, 503

Birbeck, Dr. M. S. C. : Biology of Hair Growth (Behaviour of the Pigment Cells), 593

Birch, Prof. A. J. : The Chemistry of Terpenoid Compounds, 470

  Biogenesis of Natural Products, 679

Birch, Prof. A. J., and others : Recent Advances in the Chemistry of Terpenoid Compounds (Structure of the Sesquiterpene Ketone Zierone), 470

Bird, Lieut.-Colonel G. W. G. : Haemagglutinins in *Calpurnia aurea*, 657

Bird, L. H. : Role of Damaged Starch in the Evaluation of Wheat Quality, 815

Bird (Oliver) Trust : Awards for laboratory or clinical work on the Control of Conception, 737

  Annual Lectures, 737

Bird (Oliver) Lecture : First (Dr. T. Mann), 1027

Bird (Xerophilous) : Experimental Induction of the Breeding Season in a (Dr. A. J. Marshall and H. J. de S. Disney), 647

Birds : 'Angels' on Centimetric Radars caused by (W. G. Harper), 847

  Seven (Edna Johnson), *review*, 676

Birds of New Guinea (Tom Iredale), *review* by Dr. A. J. Marshall, 675, 787

Birds of the British Isles (Dr. David Armitage Bannerman), Vol. 6, Ciconiidae, Ardeidae, Phoenicopteridae, Anatidae (part), *review* by Sir Landsborough Thomson, 159

Birds, British : Fiftieth Anniversary of, 70

Birds (Diving) : Right-Ventricle Pressures and Heart-Rate in (Einar Eliassen), 512

Birds (Oil-polluted) : Cleansing of (Royal Society for the Prevention of Cruelty to Animals Pamphlet on), 1453

Birk, Yehudith, and others : Cytochrome Composition of some Strains of *Streptomyces*, 608

Birkbeck College, London : Appointment of Dr. H. C. K. Henderson to the University of London readership in geography, 122

Birket-Smith, Dr. J. : Honey Bees in Southern Nigeria, 511

Biscoe, R. R. S. *John* : Annual Relief Voyage to the Antarctic, 837

Bishop, Sir Harold : New Laboratories of the Department of Electrical Engineering in the University of Sheffield opened by, 414

Bishop, J. R. : Vapour Detectors for Gas Chromatography (Use of Directly Heated Bead Thermistors in Thermal Conductivity Detectors), 23

Bishop, O. N. : School Natural History Societies Exhibition, 1399

Bishop Museum (Bernice P.), Honolulu : Annual Report for 1956 (No Ivory Tower), 1452

Bistable Multivibrator Operation : Analysis of—the Eccles-Jordan Flip-Flop Circuit (P. A. Neeteson), *review* by Dr. R. L. Smith-Rose, 401

Bittner, J. J., and others : Biological Rhythms (The 24-hour Periodicity of Division in Normal and Malignant Cells), 1101

Bizley, M. T. L. : Probability, *review* by Dr. D. J. Finney, 1270

Bjorksten Research Laboratories, Inc. : Polyesters and their Applications, *review* by E. W. Russell, 774

Blache, Jules, et autres. Le Ciel et la Terre, *review* by Bernard Pagel, 59

Black, J. W., and others : Inhibitory Effect of 5-Hydroxytryptophan on Acid Gastric Secretion, 1127

Black, M., and Wareing, Dr. P. F. : Sensitivity of Light-inhibited Seeds to certain Spectral Regions, 395

Black, Dr. R. M., and Lyons, Dr. B. J. : Effect of High-Energy Radiation on Polypropylene, 1346

Black and White Elephants at Aldermaston (Dr. T. E. Allibone), 1178

Blackburn, J. : Appointed assistant government chemist, Northern Region, Nigeria, 219

Blacker, Dr. C. P. : Presented with the Galton Medal of the Eugenics Society, 1461

Blackett, Prof. P. M. S. : Appointed by the Royal Society to deliver the Rutherford Memorial Lecture for 1958, 119

  Technology and World Advancement (Presidential Address to the British Association for the Advancement of Science), 473

  Endeavour Prizes for the 1957 Essay Competition presented by, 529

Blackman, Dr. M., and Grunbaum, E. : Study of the Magnetic Leakage Field in Cobalt by means of a Divergent Electron Beam, 1189

Blackwell, Dr. D. E., and others : Solar Granulation and its Observation from a Free Balloon, 211

Bladen, Prof. V. W. : Our Debt to the Future (The Social Impact of Modern Technology), 259

Blair, Atholl : *Obituary* by D. H. Alexander, 783

Blair, Dr. G. W. Scott : Rheology of Disperse Systems, 959

Blair, J. A. : Pigments and Pterins in the Skin of the Green Mamba, *Dendroaspis viridis*, 1371

Blake, J. N. : Recent Advances in Gelatin and Glue Research (Relation of Properties to Uses), 690

Blakely, R. M., and others : Lack of Growth-promoting Activity of Inactivated Penicillin with Turkey Poults, 923

Blaschko, Dr. H. : Chemical Transmission at Nerve Endings (Metabolic Route which leads to the Formation of Noradrenaline and Adrenaline), 627

Blaschko, Dr., and others : Occurrence of an Amine Oxidase in Horse Serum, 1127

Bleeding Lesions (Gastro-Intestinal) : Isotopic Tracer Method for Measurement of Iron lost into and re-absorbed from (M. Roche, M. E. Perez-Gimenez and A. Levy), 1278

Bleeding Sap of Pea Plants : Homoserine in (Dr. Janny A. Bakhuis), 713

Blevis, B. C. : Ionospheric Studies by the Lunar Radar Technique, 138

Blight (Potato), and Leaf-Roll Virus (D. E. Richardson and D. A. Doling), 866

Blight Fungus (Potato) : Infection of Native *Solanum* Species by the (C. M. Driver), 1367

Blindness in Early Summer Cauliflower (Dr. P. J. Salter), 1056

Blishen, E. : At the Annual Conference of the Library Association (The Reluctant Reader), 843

Block and Graft Copolymers (University College, London, Seminar on), 535

Blok, Prof. H. : Lubrication and Wear (Hydro-dynamic Lubrication), 1448

Blomquist, Mrs. E. : Quality Control of Food (Statistical Quality Control in the Production of Luncheon Meat), 1326

Blood : Changes of Organic Phosphate Esters during Glycolysis in, followed by a Paper Chromatography Method (Dr. L. Macho), 1351

  Clearance of Injected Heparin from the (Prof. Harold B. Eiber and Prof. Isidore Danishefsky), 1359

  Coagulation of, *review* by Dr. R. A. Kekwick, 1259

Blood in Animals : Movement of the Heart and (William Harvey), translated from the original Latin by Prof. Kenneth J. Franklin, *review* by Prof. F. J. Cole, 449

Blood Carbon Dioxide in Animals oxidizing Glucose labelled with Carbon-14 and other Labelled Substances : Radioactivity of (R. J. Robinson and Dr. R. V. Coxon), 1279

Blood Clotting : Plasma Pain-producing Substance and (J. Margolis), 1464

Blood Clotting Defect in Haemophilia and Christmas Disease : A Hitherto Unknown (Dr. F. Nour-Eldin and Dr. John F. Wilkinson), 990

Blood Coagulation (Human), and its Disorders (Dr. Rosemary Biggs and Dr. R. G. Macfarlane), second edition, *review* by Dr. R. A. Kekwick, 1259

Blood Group Specificity : Chemical Basis of, *review* by Dr. Winifred M. Watkins, 5

Blood Group Substances (Elvin A. Kabat), *review* by Dr. Winifred M. Watkins, 5

Blood-Group System (Lewis) : Specific Inhibition Studies relating to the (Dr. Winifred M. Watkins and Prof. W. T. J. Morgan), 1038

Blood Group (Diego), in Negro (Dr. P. C. Junqueira and P. J. Wishart), 341

Blood-Group Phenotype : A 'New' Kell (Dr. Bruce Chown, Marion Lewis and Kiroko Kaita), 711

Blood Group Serology : An Introduction to (Kathleen E. Boorman and Dr. Barbara E. Dodd), *review* by Dr. F. Stratton, 675

Blood Protein Formation in the Rat : Effect of Storage of Methylcellulose on (Margaret M. Frohlich, V. Balázs and S. Benko), 1474

Blood Sinusoids : Subendothelial Space between the Ovarian Interstitial Cell and the Endothelial Lining of the (Dr. M. De Groodt, A. Lagasse and Prof. M. Sebruyns), 1431

Blood Transfusion : Annual Award for work or services on (Oliver Memorial Fund), 316

Bloom, Joyce L., and others : Use of Wooden Boxes for Breeding Mice, 251

Bloomer, R. N. : Reaction of Carbon Monoxide with Evaporated Barium Films, 249

Blote, Dr. H. C. : Elected a fellow of the Museums Association, 420

'Blow-Off' Prominence : A Solar (Dr. M. A. Ellison), 589

Blower, J. Gordon : Feeding Habits of a Marine Centipede, 560

Blue (Methylene), added to a Low Fat Diet in the Mouse : Effects of (A. Fajer), 1054

Blue Light : Action of, on the Germination of Seeds (Prof. Michael Evenari, Dr. Gert Neumann and Dr. Gabriel Stein), 609

Blume, J. : Biological Rhythms (Daily Fluctuations of Bodily Functions and their Clinical Importance), 1101

Blundell, P. H. : Appointed director of the Electronic Computation Laboratory in the University of Sheffield, 893

Blundell's School Natural History Society : Report, 276

Bodenheimer, Prof. F. S., and Swirski, Dr. E. : The Aphidoidea of the Middle East, *review* by J. P. Doncaster, 1441

Bodily Feelings : Pain and Pleasure, a Study of (Prof. Thomas S. Szasz), *review* by Dr. Clifford Allen, 936

Body Radioactivity : Measurement of—Papers given at a Conference on (*British Journal of Radiology*, Supp. No. 7), 219

Boer, Dr. H. : Vapour Detectors for Gas Chromatography (Ionization Detectors employing Radioactive Sources), 22

Bogoch, Dr. Samuel : Structure of Brain Ganglioside, 197

Bogod, M. : Quality Control of Food (The Factory Manager's Outlook on Quality Control), 1327

Bogue, Dr. J. Yule : Imperial Chemical Industries, Ltd., Pharmaceutical Division—New Research Laboratories, 1091

Bohm, Dr. Otto : *Obituary* by J. Croney, 17

Bohme, Dr. H. : Vegetable Quality (*p*-Coumaroyl Quinic Acid in *Antirrhinum*), 175

Boiling Refrigerants : Suppression of Bubbling in (Dr. G. J. Minkoff, Floyd I. Scherber and Alfred K. Stober), 1413

Bolin, Dr. Bert : Nuclear Radiation Measurements during the International Geophysical Year, 311

Bollard, Dr. E. G. : Tree Physiology (Importance of Xylem Sap in the Transport of Organic Nitrogenous Materials), 77

Bolle-Jones, Dr. E. W. : Visual Symptoms in *Hevea brasiliensis* of Deficiencies in Macro- and Micro- Nutrients, 362

Bolotovsky, B. M. : Low Temperature Physics (Superconductivity—Theoretical Considerations), 461

Bolt, B. A. : Velocity of the Seismic Waves *Lg* and *Rg* across Australia, 495

Boman, Dr. Hans G. : Phosphodiesterase from Rattle-snake Venom, 1182

Bomb Explosions (Hydrogen), in 1954 : Evidence relating to the Earth's Inner Core from (Prof. K. E. Bullen and T. N. Burke-Gaffney), 49

Bombyx Silkworm : Conversion of Glycogen to Sorbitol and Glycerol in the Diapause Egg of the (Haruo Chino), 606

Bond, G. : Root Nodules of *Casuarina*, 1238

Bonded Cylinders of Soft Vulcanized Rubber subjected to Tensile Loads : Internal Flaws in (A. N. Gent and P. B. Lindley), 912

Bonds (Hydrogen) : Delocalization in (Prof. C. Reid and T. M. Connor), 1192

Bone, A. D. (Weil-Malherbe, Dr. A., and) : Intracellular Distribution of Catecholamines in the Brain, 1050

Bone, Quentin : The Problem of the 'Amphioxides' Larva, 1462

Bone and Teeth : A Lipid Material in, in Experimental Chronic Fluorosis (Gertrud Lindemann), 926

Bone Marrow, Spleen and Liver of Rats : Influence of Post-Irradiation Administration of Methionine on the Levels of Deoxyribonucleic Acid in (M. K. Narurkar, A. J. Baxi, N. S. Ranadive, M. V. Narurkar and M. B. Sahasrabudhe), 193

Bones of Growing Diabetic Rats : Action of Glucose-1-Phosphate on the Deposition of Phosphate in the (Dr. N. Siliprandi, G. De Bastiani, F. Petrelli and B. Fischetti), 1357

Bones (Embryonic Chick) : Cultivation of, on Chemically Defined Media (Dr. J. D. Biggers, Dr. M. Webb, and Dr. Raymond C. Parker and George M. Healy), 825
Boney, A. D., and others : Research in Marine Biology (Adaptation of the High-level Shore Lamellibranch *Lasaea rubra*), 746
Bongard, M. M., and others : Visual Problems of Colour (Extra-Foveal Colour-Matching), 1397
Bonham-Carter, A. D., and others : Vitality in Administration, 153
Bonhoeffer, Prof. K. F. : *Obituary* by Dr. E. A. Moelwyn-Hughes, 16
Books : Recent Scientific and Technical, Supp. vi, July 27 ; Supp. iv, August 31 ; Supp. vi, September 28 ; Supp. vi, October 26 ; Supp. v, November 30 ; Supp. vi, December 28
Boorman, Kathleen E. and Dodd, Dr. Barbara E. : An Introduction to Blood Group Serology, *review* by Dr. F. Stratton, 675
Boot, Dr. H. A. H., and Harvie, R. B. R.-S. : Charged Particles in a Non-uniform Radio-frequency Field, 1187
Booth, Dr. A. D. : Double Meanings, *review*, 823
  Numerical Methods, *review*, 875
  Computers, *review*, 1009
  Automatic Digital Calculators—a Retrospect, 1089
Booth, N. E. : Appointed an Imperial Chemical Industries Research Fellow at the University of Birmingham, 738
Bor, Dr. N. L. : British Trees, *review*, 59
Borg-Petersen, C. (Fennestad, K. L., and) : *Leptospira* Antibody Production by Bovine Foetuses, 1210
Boric Acid Inhibition of Growth in certain Soil Micro-organisms : Reversal of (Alan M. Shefner and Betty J. Burkhardt), 1207
Borman, J. : Protein Structure and Biological Activity, 835
Bormann, Dr. F. H. : Tree Physiology (Photosynthesis of Trees), 77
Born, Dr. G. V. R. : Evidence for the Formation of a Labile Phospholipoprotein during the Clotting of Platelet-rich Plasma, 546
Boron in the Glasshouse Tomato Plant (B. Wilkinson), 666
Boron Nitride Crystals : Evidence from Moiré Patterns of Packing Faults in (Dr. J. F. Goodman), 425
Boron Trifluoride Complex Formation : Nuclear Magnetic Resonance Studies of (P. Diehl and R. A. Ogg, Jun.), 1114
Borough Polytechnic, London : Course of lectures on the Technique of Technical Writing, 585
Borovik-Romanov, A. S., and others : Low-Temperature Physics (Anti-ferromagnetism in Anhydrous Sulphates and Carbonates of the Transition Metals), 462
Borruso, Dr. D. (Centola, Prof. G., and) : Fundamental Aspects of Fibres and their Treatment for Papermaking (Process of Beating—Influence on Beating of certain Electrolytes and Substantive Azo-dyes), 1177
Borst, Dr. Lyle B. : The Convergatron, 1096
Bose, Prof. S. R. : Mitosis in Vegetative Hyphae of Higher Fungi (Hymenomycetes), 45
Botanic Gardens, Singapore : Report on work done during 1956 (J. W. Purseglove), 1238
Botanic Gardens (Royal), Kew : Report for 1956 (Prof. C. W. Wardlaw), 370
Botanical Congress : Ninth International, 688
Botanical Society of the British Isles : Conference Report No. 4, Species Studies in the British Flora (edited by J. E. Lousley), *review*, 1155
Botany (Agricultural), National Institute for : Report for 1956, 736
Bottomley, Dr. G. A. (Whytlaw-Gray, Prof. R., and) : A Significant Error in the Determination at Low Pressures of the Virial Coefficients of Vapours, 1252
Bould, C. : Trace Elements in Soils, Plants and Animals (Iron Chelates for Control of Chlorosis in Plants), 23
Bound Form of Nicotinic Acid : Isolation of the (Prof. B. C. Guha and M. L. Das), 1285
Bourdillon, Dr. J. : The Glass Scratch Effect and Molecular Structure, 1475
Bourke Lectures of the Faraday Society (Prof. W. Jost), 838
Bourne, Dr. G. H. : Appointed professor of anatomy at Emory University, Georgia, 169 ; work of, 169
  Use of a Histochemical Technique to demonstrate the Cutaneous Penetration of Adrenalin and Nor-Adrenalin, 1488
Bovet, Prof. Daniel : Awarded the Nobel Prize for 1957 for Physiology and Medicine, 951 ; work of, 951
Bovine Foetuses : *Leptospira* Antibody Production by (K. L. Fennestad and C. Borg-Petersen), 1210
Bovine Serum Albumin and Ovalbumin : Liberation of Tyrosine Hydroxyl Groups in Urea Solutions of (A. N. Glazer, Dr. H. A. McKenzie and R. G. Wake), 1286
Bovines : Congenital Porphyria in—First Living Cases in Britain (Prof. E. C. Amoroso, R. M. Loosmore, Prof. C. Rimington and B. E. Tooth), 230
Bowden, Dr. F. P. : Initiation and Growth of Explosion in Solids (Initiation of Explosion), 73 ; (Decomposition and Explosion by Ionizing Radiations), 74
  Lubrication and Wear (Friction and Boundary Lubrication), 1449
Bowden, J. : Appointed senior entomologist, Uganda, 1454
Bowen, E. G. : A Prediction of a Meteor Orbital Period, 737
Boxes (Wooden) : Use of, for Breeding Mice (Joyce L. Bloom, Dr. W. Lane-Petter and G. Porter), 251
Boyd, R. L. F. : Ionization Phenomena in Gases (Collision Studies and Discharge Investigations), 791
Boyd, Prof. William C. : Fundamentals of Immunology, third edition, *review* by Prof. J. R. Marrack, 257
Boyd, W. J. R. : Appointed agricultural officer, Northern Rhodesia, 220
Boyland, Prof. E., and others : The Non-Toxicity of Maleic Hydrazide for Mammalian Tissues, 62
Brabazon Premium of the British Institution of Radio Engineers awarded to K. E. Harris, 529
Brachiopods : Chazyan and related (Dr. G. A. Cooper), *review* by Prof. Alwyn Williams, 401
  Fossil, *review* by Prof. Alwyn Williams, 401
Brachynotus sexdentatus (Risso) : Introduction of a Grapsoid Crab, into British Waters (E. Naylor), 616
Bradford, Dr. B. W. : Modern Analytical Chemistry in Industry (Process Analytical Control), 368
Bradford, E. F. : Appointed principal geologist, Federation of Malaya, 21
Bradford Institute of Technology : Symposium on the Chemistry of Plastics, 1454
Bradley, D. E., and Juniper, B. E. : Electron Microscopy of Leaf Surfaces, 330
Bradley, P. L. : Metabolism of Pyruvate and α-Ketoglutarate in Virus-infected Mouse Brain, 1418
Braekkan, Olaf R., and others : Effect of Relative Humidity on Rat Breeding and Ringtail, 290
Brain : Intracellular Distribution of Catecholamines in the (Dr. A. Weil-Malherbe and A. D. Bone), 1050
Brain (Human) : Repetitive Property of the, as studied by the Electroencephalograph and the Method of After-Images (Dr. Catherine Popov), 328
Brain (Virus-infected Mouse) : Metabolism of Pyruvate and α-Ketoglutarate in (P. L. Bradley), 1418
Brain Function and Behavior : Hormones,—Proceedings of a Conference on Neuroendocrinology, New York, 1956 (edited by Hudson Hoagland), *review* by Dr. Marthe Vogt, 304
Brain Ganglioside : Structure of (Dr. Samuel Bogoch), 197
Brain Homogenates : Clearing Action of Lysolecithin on (Dr. G. R. Webster), 660
Brain Tissue : Sodium Ions and Tissue Metabolism—some Metabolic Peculiarities of (Genkichiro Takagaki and Yasuzo Tsukada), 707
Brains of Different Animals : Catechol Compounds in Rat Tissues and in (Dr. K. A. Montagu), 244
Brambell, Prof. Rogers : Biological Aspects of Cancer, 830
Bramlette, M. N., and others : Localization of Radioactive and Stable Heavy Nuclides in Ocean Sediments, 85
Bramson, M. J. (Harling, John, and) : Operational Research (Level of Protection afforded by Stocks), 1088
Branagan, D. : Appointed veterinary officer, Tanganyika, 688
Brand, Prof. Louis : Vector Analysis, *review* by Dr. A. W. Gillies, 824
Brändli, S., and others : Relation between Ribonuclease Activity and Ribonucleic Acid Content, 1048
Brandt, N. B., and Ventzel, V. A. : Low-Temperature Physics (Influence of Pressure on the de Haas—van Alphen Effect), 461
Brandt, N. B., and others : Low-Temperature Physics (Galvano-magnetic Properties of Bismuth, Tin and Aluminium), 461
Branscomb, L. M. : Ionization Phenomena in Gases (Photodetachment Studies of Negative Ions), 791
Brasher, Miss D. M., and De, C. P. : Passivation of Iron by Chromate Solutions, 28
Brasher, Miss D. M., and others : Passivation of Iron by Chromate Solutions, 27
Branster, Marjorie V., and Morton, Prof. R. K. : Isolation of Intact Liver Cells, 1283
Brass, W. : Towards a Standard Terminology in Statistics, *review*, 518
Brass *in vacuo* : Effect of Stress on Hole Formation during the Diffusion of Zinc from (Dr. L. M. T. Hopkin), 808
Brattstrom, Prof. Hans : University of Bergen—New Laboratory Buildings of the Biological Station, 1159
Braun, Prof. Werner, and others : A Phenol-extracted Bacterial Deoxyribonucleic Acid, 1356
Braun-Falco, Dr. O. : Biology of Hair Growth (Distribution of Enzyme Systems as revealed by Histochemical Techniques), 593
Bray, R. C., and others : Xanthine Oxidase Activity during Mammary Carcinogenesis in Mice, 763
Brazilian Society for the Progress of Science : Annual Meeting in Rio de Janeiro, 465
Bread : Flour and (Nutrition Society Symposium on), 317
Bread Wheats : Transference of Rust-resistance to (— Elliott), 736
Breakage (Chromosome) : Relation of Colchicine to (Douglas Davidson), 1059
Breaking Polymer Molecules : Making and (British Association for the Advancement of Science, Section B (Chemistry), Discussion on), 899
Brech, E. F. L. : Organization—the Framework of Management, *review* by Rosemary Stewart, 621
  Executives in Industry, *review*, 1153
Brecht, Prof. W. : Fundamental Aspects of Fibres and their Treatment for Papermaking (Bonded-Fibre Assemblages—Effect of Beating on the Property of Hygrostability of Paper, and the Influence of Paper Composition, Thickness and Density), 1177
Brecy, H. (Dausset, J., and) : Identical Nature of the Leucocyte Antigens detectable in Monozygotic Twins by means of Immune Iso-Leuco-agglutinins, 1430
Breeding (Rat), and Ringtail : Effect of Relative Humidity on (Leif Rein Njaa, Finn Utne and Olaf R. Braekkan), 290
Breeding Mice : Use of Wooden Boxes for (Joyce L. Bloom, Dr. W. Lane-Petter and G. Porter), 251
Breeding Season in a Xerophilous Bird : Experimental Induction of the (Dr. A. J. Marshall and H. J. de S. Disney), 647
Breton, C., *et al.* : Ionization Phenomena in Gases (Production and Study of Heavy-Current Discharges), 793
Brew, Dr. Josephine Macalister : *Obituary* by Sir John Wolfenden, 68
Brew (Dr. Macalister) Scholarship Fund (To be established by the National Association of Mixed Clubs and Girls' Clubs), 314
Briggs, D. K. H., and Drake, W. D. : Prediction of Critical Temperatures, 1353
Briggs, Prof. G. E. : Ion Permeability of the Plasmalemma of the Plant Cell, 1142
Bright, Dr. A. W., and Ramanathan, K. : Discharges in Hydrogen at the Ion Cyclotron Frequency, 1468
Brightman, R. : The Civil Service in Great Britain, *review*, 105
  Records and Research in Engineering and Industrial Science, *review*, 453
  Science and the United States Government, *review*, 568
Brightwell, S. : Quality Control of Food (Quality Control of Open Packed Meat Products), 1326
Brinck, P., and others (edited by) : South African Animal Life—Results of the Lund University Expedition in 1950-1951, Vols. 1-3, *review* by Prof. O. Lowenstein, 56
Brindley, G. S. : Visual Problems of Colour (Bearing on Colour Vision of the latest work on the Electroretinograph and the Spike Discharges from Retinal Elements), 1396
Brindley, G. W. : At the International Congress on Crystallography (Clay Minerals), 956
Brisse, A. H., and others : At the Second International Conference on Coal Science (Colour film showing the Behaviour of certain Coal Constituents on Heating Thin Sections under the Microscope), 419
Bristol City Museum : Report for 1956, 795

Britain : The Balance of Government Scientific Research in, 720
Biological Productivity of (Institute of Biology Symposium on), 531
Congenital Porphyria in Bovines—First Living Cases in (Prof. E. C. Amoroso, R. M. Loosmore, Prof. C. Rimington and B. E. Tooth), 230
Forest Research in (Dr. E. W. Jones), 967
Geological Resources of (Parliamentary and Scientific Committee Discussion on), 71
Museums in (R. B. Southall and Prof. Hugh O'Neill), 1146
Museums and Art Galleries in, 769
National Wage and Salary Policy in (Dr. Elliott Jaques), 525
New Nature Reserves in, 78
Occurrence of *Crepidostomum metoecus* (Braun, 1900) in (Dr. J. D. Thomas), 1492
Reports of the Nationalized Industries in, 1321
Research on Roads in (T. M. Charlton), 588
Roman Roads in (Ivan D. Margary), Vol. 2, North of the Fosse Way—Bristol Channel (including Wales and Scotland), *review* by C. W. Phillips, 1256
Scientific and Industrial Research in, 1237
Scientific and Technical Manpower in, 1075, 1169
Scientists in the Government Service in—Special Promotions, 638
Training Overseas Engineers in, 635
See *also* under Great Britain
Britain and Norway : Collaboration between, in Atomic Energy Developments, 361
Britain's Nature Reserves (E. M. Nicholson), *review*, 1267
British Association for the Advancement of Science : Conference on the Supply of Trained Men and Women, 305
Presidential Address, Technology and World Advancement (Prof. P. M. S. Blackett), 473
Summaries of Addresses of Presidents of Sections, 479
Presidential Address to Section A (Mathematics and Physics), Stellar Energy and Stellar Evolution (Prof. T. G. Cowling), 479
Presidential Address to Section B (Chemistry), Chemical Approaches to the Investigation of Lung Cancer (Dr. J. W. Cook), 479
Presidential Address to Section C (Geology), Ordovician Volcanoes (Dr. G. H. Mitchell), 480
Presidential Address to Section D (Zoology), Evolution of Organization in the Nervous System (Prof. J. Z. Young), 480
Presidential Address to Section E (Geography), The Everlasting Hills (Prof. David L. Linton), 481
Presidential Address to Section F (Economics), The Balance-of-Payments Problems of a European Free-Trade Area (Prof. J. E. Meade), 481
Presidential Address to Section G (Engineering), Education and Training for the Engineering Industry (Sir David Anderson), 482
Presidential Address to Section H (Anthropology and Archaeology), Archaeology as Science—Purposes and Pitfalls (Prof. C. F. C. Hawkes), 483
Presidential Address to Section I (Physiology and Biochemistry), Chemical Transmission at Nerve Endings (Sir Lindor Brown), 484, 627
Presidential Address to Section J (Psychology), The Worker and his Work (Dr. H. G. Maule), 485
Presidential Address to Section K (Botany), Aspects and Problems of Conifer Embryology (Prof. J. Doyle), 485
Presidential Address to Section L (Education), The Education of the Countryman (L. R. Missen), 486
Presidential Address to Section M (Agriculture), The Role of Agriculture in the British Economy (Sir James Turner), 486
Presidential Address to Section X (Assembly of Corresponding Societies), The Vasculum and the Microtome (Prof. D. A. Webb), 487
A View of Ireland (edited by James Meenan and David A. Webb), *review*, 488
Election of Sir Alexander Fleck as president for 1958, 528
Gifts to the Association, 529
Presentation of *Endeavour* Prizes for the 1957 Essay Competition, 529
Section A (Mathematics and Physics) : Discussion on Exploration of the Deep Ocean Floor, 778
Section A (Mathematics and Physics) : Discussion on the Industrial Applications of Thermonuclear Reactions, 780
Section B (Chemistry) : Special meeting on Element 102, 361
Section B (Chemistry) : Symposium on Biogenesis of Natural Products, 679
Section B (Chemistry) : Discussion on Making and Breaking Polymer Molecules, 899
Sections B (Chemistry) and K (Botany) : Joint Discussion on the Biology of Yeast, 1161
Section D (Zoology) : Symposium on the Biology of the Salmon, 789
Section D (Zoology) : Discussion on the Biological Aspects of Cancer, 830
Section D (Zoology) : Symposium on the Structure and Functioning of the Nervous System, 1388
Sections D (Zoology), I (Physiology and Biochemistry), K (Botany) and M (Agriculture) : Joint Discussion on Radiation and Biology, 628
Section I (Physiology and Biochemistry) : Discussion on Chemical Transmission at Nerve Endings, 627
Section I (Physiology and Biochemistry) : Discussion on Underwater Swimming and Diving, 883
Section I (Physiology and Biochemistry) . Discussion on Electrolyte Physiology, 1017
Sections I (Physiology and Biochemistry) and M (Agriculture) : Joint Discussion on the Infant Animal, 681
Section J (Psychology) : Symposium on the Psychological and Occupational Aspects of Ageing, 902
Section K (Botany) Discussion on Photosynthesis, 1083
Sections K (Botany) and M (Agriculture) : Joint Discussion on the Ecology of Grasslands, 1173
Sections L (Education) and J (Psychology) : Joint Discussion on Bilingualism in Education, 689
Section X (Assembly of Corresponding Societies) : Discussion on Science in Schools, 730
British Birds : Fiftieth Anniversary of, 70
British Broadcasting Corporation : To broadcast Information of Solar Activity, 120
Engineering Training in the (Dr. K. R. Sturley), 537
Award of Research Scholarships, 787
Reith Lectures for 1957 (Prof. George F. Kennan), 893
British Cast Iron Research Association : Open Days (Dr. J. G. Pearce), 222
British Coal Utilization Research Association : Sixth Coal Science Lecture (M. Cheradame), 891
British Commonwealth, Association of Universities of the : Yearbook of the Universities of the Commonwealth, 1957, *review*, 774
British Commonwealth Scientific Office in Washington . Appointment of E. S. Hiscocks as director of the United Kingdom Scientific Mission, 220
British Computer Society : Election of Dr. M. V. Wilkes as first president, 637
First Meeting, 953
Inauguration of the Glasgow Branch, 1097
British Council : Report on University Interchange between the United Kingdom and other European Countries (1948-56), 170
Scholarships for Study Abroad, 1325
British Countryside : The Essayist of the, *review* by Sir John Russell, 1257
British Economy : The Role of Agriculture in (Sir James Turner), 486
British Electrical and Allied Industries Research Association : Annual Report (Prof. H. Greig), 271
British Embassy, Washington : Appointment of E. S. Hiscocks as attaché for scientific questions, 220
British Empire Cancer Campaign : Thirty-fourth Annual Report, 1312
British Federation of University Women : Report on Opportunities for Girls and Women in Science and Technology, 127
British Flora : Species Studies in the (edited by J. E. Lousley), (Botanical Society of the British Isles, Conference Report No. 4), *review*, 1155
British Food Manufacturing Industries Research Association : Re-election of Prof. A. C. Frazer as president, 122
British Gelatine and Glue Research Association : Conference on Recent Advances in Gelatin and Glue Research, 690
British Industries, Federation of : Overseas Scholarship Scheme, 635
British Industry : Technical Progress in, *review* by Dr. R. Beeching, 301
British Institute of Management : Twelfth National Conference (Research—a Signpost to Better Management), 270
British Institute of Management and the Manchester College of Science and Technology : Company Executive Development Scheme, a Survey in North-West England, 153
British Institution of Radio Engineers : Convention on Electronics in Automation, 369
Clerk Maxwell Premium awarded to Dr. K. D. Froome, 529
Heinrich Hertz Premium awarded to Dr. A. G. Edwards, 529
Brabazon Premium awarded to K. E. Harris, 529
Louis Sterling Premium awarded to Dr. A. van Weel, 529
Marconi Premium awarded to Prof. P. M. Honnell, 530
Dr. Norman Partridge Memorial Award awarded to H. J. Leak, 530
British Institute of Radiology : Nineteenth Annual Congress, 1028
British Internal Combustion Engine Research Association : Appointment of Dr. W. P. Mansfield as director of research 1237
British Interplanetary Society : Realities of Space Travel—Selected Papers of the (edited by L. J. Carter), *review* by Prof. D. R. Bates, 453
British Iron and Steel Research Association (South Wales Laboratories) : Research on Metal Coatings, 123
British Iron and Steel Research Association and the Iron and Steel Institute : Translation Service, 218, 316
British Isles : The Birds of the (Dr. David Armitage Bannerman), Vol. 6, Ciconiidae, Ardeidae, Phoenicopteridae, Anatidae (part), *review* by Sir Landsborough Thomson, 159
Late-Glacial Finds of *Lepidurus arcticus* (Pallas) in the (G. F. Mitchell), 513
British Journal of Radiology : Supp. No. 7, Papers given at a Conference on the Measurement of Body Radioactivity, 219
British Museum (Natural History) : Exhibit on the Neolithic Revolution, 70
Exhibit to commemorate the work of James Sowerby, 70
Appointment of Dr. W. E. China as a deputy chief scientific officer, 122
Appointment of Dr. Francis Charles Fraser as keeper in the Department of Zoology, 122, 216
Appointment of James David Macdonald as a deputy keeper in the Department of Zoology, 122, 216
Bulletin of the, Zoology, Vol. 4, No. 9, Evolutionary Trends in the Classification of Capitate Hydroids and Medusae (Dr. William J. Rees), 130
Retirement of Dr. H. W. Parker as keeper of zoology, 216
Short Guide to the Exhibition Galleries, 269
Gift by the Society of Antiquaries of the Stanwick Skull, 1027
Gift by Mrs. P. Harwood of the collection of British Insects amassed by the late Philip Harwood, 1238
Christmas Lectures for Junior Audiences, 1394
British National Committee for Non-Destructive Testing, 169
British National Food Survey (Miss M. W. Grant), 587
British North Greenland Expedition . High Arctic—the Story of the (Mike Banks), *review* by Sir Raymond Priestley, 1258
British Nuclear Energy Conference . Admittance of the Institute of Fuel to membership, 1098
British Ornithologists' Union : Centenary of the, 1169
British Overseas Territories : Health in, 314
British Oxygen Co., Ltd. : Fellowship for Postgraduate Research awarded to R. D. Johnston, 413
Fellowships for Postgraduate Research awarded to J. W. Arnold, R. K. MacCrone and J. B. Thompson, 270
Renewal of a Fellowship granted to R. A. H. Pool, 270
British Paper and Board Makers' Association . Symposium on Fundamental Aspects of Fibres and their Treatment for Papermaking, 1175
British Pharmaceutical Congress : Chairman's Address (Frank Hartley), 641
British Photographers, Institute of . Eighth Conference of the Medical Group, 172
British Public Schools and the Future, 515
British Rainfall Organization : Memorial to G. J. Symons, 313
British Rubber Producers' Research Association : Nineteenth Annual Report (1956), 962
British Scientific Instrument Research Association : Open Days at the laboratories at Chislehurst, 220, 413, 1177
British Scientific Instrument Research Association (Department of Physics of the University of Cambridge and the) : Meeting on the Vacuum Deposition of Metals, 124
British 'Skylark' Rockets : Instrumentation of, 1097

British Society for Immunology : *Immunology*, 21
  Symposium on Non-specific Immunity, 640
  Autumn Meeting, 838
  Symposium on Immuno-haematology, 838
British Society for Research on Ageing : Symposium on the Biology of Hair Growth, 592
British Society of Rheology : Conference on Rheology of Elastomers, 75
  Conference on the Rheology of Disperse Systems, 363, 957
  Election of Officers for 1957-58, 838
British Standards Institution Flammability of Apparel Fabrics in relation to Domestic Burning Accidents, 1102
British Steel Castings Research Association . New Research Station (Dr A H Sully, 221
British Steel Castings Research Association and the Steel Founders' Society of America : Arrangement for the exchange of information, 218
British Thomson-Houston, Ltd (Physical Society, in collaboration with) Spring (1956) Meeting (Semiconductors), 25
British Trees (Miles Hadfield), *review* by Dr. N. L. Bor, 59
British Universities : Scientific Research in (1956-57), 1323
British Veterinary Association Annual Congress, 316
British Waters . Introduction of a Grapsoid Crab, *Brachynotus sexdentatus* (Risso), into (E. Naylor), 616
Britt, C J (Wagg, R E, and) Dirt Removal from Cotton, 48
Brittle Materials : Mechanical Properties of Non-Metallic (National Coal Board Conference on), 412
  Strength of Highly Porous (K. Schiller), 862
Brittleness in Chromium : Strain—Age Hardening and (C W Weaver), 806
Broad Bean Roots : Dependence on Oxygen and Temperature of the Sensitivity of, to γ-Radiation (G. J Neary), 248
Brock, Dr. G C : Appointed lecturer in civil engineering at the University of Birmingham, 738
Brock, Prof J. F., and others : Effect of Different Dietary Fats on the Faecal End-Products of Cholesterol Metabolism, 923
Broecker, W. C, and collaborators : The Abyssal Circulation of the Ocean, 733
Broglia, P., and others . Combined Light and Velocity Measurements of the Variable Star 12 Lacertae, 1112
Bromine . Reaction of, with Uracils (Dr Shih Yi Wang), 91
Bromley, D B . Psychological and Occupational Aspects of Ageing (Effects of Age on Intellectual Processes), 902
Bronowski, Dr. J . Coal and Coal Chemicals in the National Economy (Dalton Lecture of the Royal Institute of Chemistry), 636
  Knowledge and Education (Presidential Address to the Library Association), 843
Brookes, Dr Edgar *Apartheid*, 686
Brookhaven National Laboratory, Upton, Long Island (*Atoms for Peace Digest*, Vol 3, No. 1), 589
Brooks, Prof. Charles F . Retirement as professor of meteorology at Harvard University and director of the Blue Hill Observatory, 313 ; work of, 313
Broome, A W J (Robertson, H A., and) : Trace Elements in Soils, Plants and Animals (Results of Injections of Thyroxine and Thiouracil in Sheep), 24
Brower, Mrs Jane Van Zandt : Experimental Studies of Mimicry in some North American Butterflies, 444
Brown, A. F. C., and others . Variation of Elastic Constants of Hardened 1 per cent Carbon Steels on Tempering, 1254
Brown, B. T, and others Cis-Hydroxylation of Digitoxin, 607
Brown, Dr C L : Tree Physiology, 78
Brown, Dr Geoffrey M : Radio Research 1956, 642
Brown, Sir Lindor . Chemical Transmission at Nerve Endings (Presidential Address to Section I (Physiology and Biochemistry), of the British Association for the Advancement of Science), 484, 627
Brown, Dr Margaret E, and Metcalfe, Dr George : Nitrogen Fixation by a Species of *Pullularia*, 282
Brown, Paul K, and others : Visual Pigments and Depths of Habitat of Marine Fishes, 969
Brown, Patricia Smith, and others : Visual Pigments and Depths of Habitat of Marine Fishes, 969
Brown, Dr Russell : Appointed lecturer in electrical engineering at the University of Sheffield, 893
Brown, R. (Possingham, J V., and) . Intracellular Incorporation of Iron-59 into the Root Cells of *Pisum*, 653
Brown, R. Hanbury, and others : Correlation between Photons, in Coherent Beams of Light, detected by a Coincidence Counting Technique, 324
Brown, S. C. : Ionization Phenomena in Gases (Microwave Gas Discharge Breakdown in the Presence of Magnetic Fields), 792
Brown, W. M. Court, and others . The General Radiation Syndrome—Initial Reaction in the Monkey, 1466
Brown Library and its Satellites, 1857-1957 Centenary of the (Dr. G. Chandler), 20
Brown-Grant, Dr. K Appointed lecturer in physiology at the University of Birmingham, 122
Browne, Flight-Lieut M. Kennedy . Use of 'Nobecutane' in attaching Skin Electrodes, 192
Browning, Prof. C H Commemoration of Paul Ehrlich's Genius, *review*, 620
Browning (Enzymic), in Cacao : Detection of the Substrate of, by a Post-chromatographic Enzymatic Technique (Dr L A Griffiths), 1373
Bruce, Hilda M. . Studies on Fertility (Investigations on Hamsters), 227
Brunt, A A. Appointed plant pathologist, virologist, West African Cocoa Research Institute, Ghana, 21
Brussels Universal and International Exhibition (1958), 1322
Bruun, Dr. F. Anton, and others (edited by) : The Galathea Deep Sea Expedition, 1950-1952 (translated from the Danish by Reginald Spink), *review* by Dr. L. Harrison Matthews, 349
Bruwer, J A Photographic Observations of Minor Planets, 1392
  Photographic Observations of Comets, 1392
Bryan, Dr. G J., and Noonan, Dr E. C. : Initiation and Growth of Explosion in Solids (Ignition of Explosive Materials by the Compression of Gas Spaces), 73
Bryce, D. Appointed junior research fellow in zoology at the University of Sheffield, 21
Bubbling in Boiling Refrigerants : Suppression of (Dr. G. J. Minkoff, Floyd I. Scherber and Alfred K. Stober), 1413
Buchanan Medal for 1957 of the Royal Society awarded to Sir Neil Hamilton Fairley, 1025, 1232
Bucher, Dr. H. Fundamental Aspects of Fibres and their Treatment for Papermaking (Morphology of Pulp Fibres—Discontinuities in the Microscopic Structure of Wood Fibres), 1176
Buchi, Prof. A. : Recent Advances in the Chemistry of Terpenoid Compounds (Structure of 'Carvone Camphor'), 471
Buchi, Dr. G. : Recent Advances in the Chemistry of Terpenoid Compounds, 471
Buckingham, Dr. H., and Price, E M : Electro-Technology for National Certificate Courses, Vol 2, *review* by Dr P F. Soper, 1309
Buckingham, Dr R A Numerical Methods, *review* by Dr A. D. Booth, 875
Buckland, Dr. William R (Kendall, Prof Maurice G., and) . A Dictionary of Statistical Terms, *review* by W. Brass, 518
Buffers : Starch Gel Electrophoresis in a Discontinuous System of (Dr. M D Poulik), 1477
Building Research 1956 (Report of the Building Research Board with the Report of the Director of Building Research), 1032
Building Research Board Report for 1956, with the Report of the Director of Building Research, 1032
Bull, G. A : International Meteorology, *review*, 107
  Popular Guides to the International Geophysical Year, *review*, 519

Butler, Prof. J. A. V., and others · Sites of the Incorporation of an Amino-acid into Proteins of *Bacillus megaterium*, 383
  Molecular Weights and Physical Properties of Deoxyribonucleic Acid, 1340
Butler, R. J. : Supply of Trained Men and Women, 305
Butler, R. W. : Appointed veterinary research officer, Tanganyika, 21
Buttercup Petals : Variation in the Number of (E. A. Potter), 179
Butterflies (North American) : Experimental Studies of Mimicry in some (Mrs. Jane Van Zandt Brower), 444
Butters, B. : Appointed soil fertility chemist, Uganda, 21
Butyl Benzimidazolone (5-Tertiary) : Antimitotic Activity of (Dr. H C. Stoerk, R. N. Arison and J E. Hawkins, Jun.), 1428
Buu-Hoï, N. P. A Convenient Method for Labelling Biologically interesting Carboxylic Acids with Tritium, 385

CABOT (Maria Moors) Foundation : Symposium on Tree Physiology, 77
Cacao : Detection of the Substrate of Enzymic Browning in, by a Post-chromatographic Enzymatic Technique (Dr. L. A. Griffiths), 1373
Cacao Seedlings in Nigeria : A Die-back of, caused by a Species of *Phytophthora* (S. R Chant), 1494
Cachia, Dr. G P, and Whitbread, Dr E. G. : Initiation and Growth of Explosion in Solids (Growth of Explosion), 74
Caesium Plumbochloride : A Phase Transition in (Chr. Kn. Moller), 981
Caesium Resonators : Comparison of, by Transatlantic Radio Transmission (Dr L Essen and J V. L. Parry, and J. A Pierce), 526
Cain, R. B. : Awarded second prize by the British Association for the Advancement of Science for the 1957 *Endeavour* Essay Competition, 529
Caine, Sir Sydney : Education for Development, 1099
Cajal, Santiago Ramón y : Studies on the Cerebral Cortex (Limbic Structures), (translated from the Spanish by Lisbeth M. Kraft), *review* by Prof B. Delisle Burns, 106
Calanoid Copepods . Copulation in (Dr. D. T. Gauld), 510
Calcium Monoaluminate : Crystal Structure of (Maryon W. Dougill), 292
Calcium Ions (Sodium, Potassium and), in the Haemolymph of *Oncopeltus fasciatus* (Dallas), (Prof. James A. Mullen), 813
Calcium Requirements of *Azotobacter* (J. R. Norris and H L. Jensen), 1493
Calcium Silicates : Crystallographic Data for the (Dr. L. Heller and Dr. H. F. W. Taylor), *review* by Dr. M. H Hey, 6
Calculating Machines Digital, and their Application to Scientific and Engineering Work (G A. Montgomerie), *review* by Dr. A. D. Booth, 823
Calculation of Atomic Structures (Prof Douglas R. Hartree), *review* by Dr. R. J Eden, 822
Calculators . Automatic Digital—a Retrospect (Dr. Andrew D. Booth), 1089
Calder, Dr. Mary : *Obituary* of Dr. Kathleen M. Drew, 889
Caldwell, Dr. P. C : Appointed by the Royal Society to an Alan Johnston, Lawrence and Moseley Research Fellowship, 119
Calf Thymocytes · Amino-Acid Composition of the Six Histones of (Dr. H. J. Cruft, J. Hindley, Dr. C. M. Mauritzen and Dr. E. Stedman), 1107
California Institute of Technology : Acceleration of Life-cycle of Southern Pine, 892
Calliphoridae (Diptera) : A Method of Marking, during Emergence from the Puparium (K R. Norris), 1002
Calo, Nora, and others : Respiratory Metabolism of Aerated Potato Disks, 1142
Calorigenic Action of Glucagon (I. W F Davidson, J. M. Salter and Prof. C H Best), 1124
Calpurnia aurea . Haemagglutinins in (Lieut -Colonel G. W. G. Bird), 657
Calvert, Dr. H. R . Lord Cherwell, 1146
Cambridge : Agriculture at (Dr. E. C Humphries), 227
Cameron, Prof Gordon Roy : New Pathways in Cellular Pathology, *review* by Prof. J. H. Gaddum, 59
Cameron, I W · Appointed lecturer in dental surgery (prosthetics) at the University of Bristol, 1171
Cameron, J. : Enhancement of Mouse-virulence of Group A Streptococci, 1136
Cameron, Prof T. W. M. . Our Debt to the Future (Human Values and the Evolution of Society), 260
  Parasitology and the Arctic, 267
  Elected president for 1957-58 of the Royal Society of Canada, 267
Campbell, R M, and others : Changes in the Intestinal Mucosa of the Sheep following Death by Humane Killer, 756
Campbell, W P. : Ergot in Gramineae, 315
Campbell, Prof. W. R . Elected president for 1957-58 of Section V (Biological Sciences) of the Royal Society of Canada, 267
Canada Council for the Encouragement of the Arts, Humanities and Social Sciences, 356
Canadian Department of Northern Affairs and National Resources : Appointment of Dr. L C M Place to be officer-in-charge of the Petawawa Forest Experiment Station, 270
  Appointment of Dr. J. S. Rowe to co-ordinate all ecological studies carried out by the Forestry Branch's forest research division, 270
Canadian Federation of Biological Societies, 1325
Canadian Forest Species : Growth and Morphogenesis in (G. H. Duff and N. J Nolan), 1393
Canadian High Polymer Forum Eighth (National Research Council of Canada and the Chemical Institute of Canada), 838
Canadian Journal of Chemical Engineering (Chemical Institute of Canada), 19
Cancer : Biological Aspects of (British Association for the Advancement of Science, Section D (Zoology), Discussion on), 830
  The Biology of, 830
Cancer, International Union against : Award of Travel Grants, 738
Cancer Campaign, British Empire : Thirty-fourth Annual Report, 1312
Cancer Congress : Seventh International, 688
Cancer Research : Progress of, 1312
Cancer in Dogs · Treatment of, by Intravenous Methylene Blue (R. T. Pursell), 1300
Cancer (Lung) · Chemical Approaches to the Investigation of (Dr. J. W. Cook), 479
  Smoking and—Report of the Tobacco Manufacturers' Standing Committee (Dr. I. Heiger), 308
Cane, Violet, and Gregory, R L. : Noise and the Visual Threshold, 1404
Cantoni, Dr. G L. (Mudd, Dr. S. Harvey, and) . Selenomethionine in Enzymatic Transmethylations, 1052
Capindale, Dr. J. B., and Tomlin, Dr D H. : Mass-Spectrometric Assay of Elementary Nitrogen, 701
Capital for Scientific Development (Royal Society of Arts Conference on), 307
Capitate Hydroids and Medusae Evolutionary Trends in the Classification of (Dr. William J. Rees), 130
Capper Pass Awards in Metallurgy (Institution of Mining and Metallurgy and the Institute of Metals), 361
Capstick, C. K , and others Methods of Studying the Microbiology of Soils (Fungal Infections of Free-living Nematodes can only be accurately estimated with Efficient Methods of Sampling Soil Nematodes), 592
Capture (Radiative), of Protons by Germanium-74 : Excited Levels in Arsenic-75 produced by (D R. Chick and S. E. Hunt), 88
Carb, Saul (Moskowitz, Prof. Merwin, and) : Surface Alteration and the Agglutinability of Red Cells, 1049
Carballido, Dr. A , and others · Sensitivity of Pancreas Hexokinase towards Alloxan and its Modification by Glucose, 387
Carbohydrate in Castor Beans : A Mechanism of Conversion of Fat to (H L. Kornberg and H Beevers), 35
Carbohydrate Metabolites : Utilization of, by Rumen Micro-organisms (the late Dr A John G. Barnett and M G. C M. Dow), 548
Carbon—Third Biennial Conference (University of Buffalo, the United States National Science Foundation and the United States Office of Naval Research), 571
Carbon during Oxidation . Changes in the Structure of (J. D. Watt and Dr. Rosalind E. Franklin), 1190
Carbon in the Sea : Production of (Dr. J. H Oliver), 617 ; (Dr. H. Cushing), 617
Carbon and Graphite : Industrial (Society of Chemical Industry Conference on), 316
Carbon Compounds : Radioactive, 636
Carbon Deposits (Refractory) : Quantitative Estimation of Graphite in, by X-Ray Technique (Prof. William A. Fred and Dr. Paul G. Herold), 1273
Carbon Dioxide as a Reversible Inhibitor of Spermatozoan Metabolism (Prof. G. W. Salisbury and N. L VanDemark), 989
Carbon Dioxide Concentration 'Γ' : Temperature Effects on the Minimum Intercellular Space (Midday Close of Stomata), (Dr. O. V. S. Heath and Dr. B. Orchard), 180
Carbon Dioxide Fixation · Lactic Acid Formation and (Dr A D. Barber), 1053
Carbon Dioxide and Temperature : Effects of, on Stomata of *Allium cepa* L. (Midday Closure of Stomata), (Dr. O. V. S. Heath and H. Meidner), 181
Carbon Dioxide (Blood), in Animals oxidizing Glucose labelled with Carbon-14 and other Labelled Substances . Radioactivity of (R. J. Robinson and Dr. R. V. Coxon), 1279
Carbon Isotopes . Bibliography for 1953 and 1954 of Syntheses of Compounds containing (J. C. Nevenzel, D. R. Howton, R F. Riley and G Steinberg), 636
Carbon Marking . Modified Method of (Dr. P. H. S. Silver), 1415
Carbon Monoxide : Reaction of, with Evaporated Barium Films (R. N. Bloomer), 249
Carbon Sources and Base Analogues of Nucleic Acid . Effects of, on the Formation of Bacterial Amylase (Juichiro Fukumoto, Takehiko Yamamoto and Daisuke Tsuru), 438
Carbon Steels (Hardened 1 per cent) : Variation of Elastic Constants of, on Tempering (A. F. C. Brown, A. G Cole and M. F. Markham), 1254
$C_6H_6^-$ and $C_7H_7^+$ Ions . Chemical Shifts in—the Free Electron Model (J. R. Leto, F A. Cotton and Dr. J S. Waugh), 978
C_{16}-Hydroxylation of Digitoxin (B. T. Brown, Prof S E Wright and G.T. Okita), 607
Carbon-14 : Degradation of Biologically Synthesized Lactose labelled with (Frederick J. Carleton, Henry R Roberts and Leighton A. Nutting), 915
Carbon-14 and other Labelled Substances : Radioactivity of Blood Carbon Dioxide in Animals oxidizing Glucose labelled with (R. J Robinson and Dr. R V. Coxon), 1279
Carboniferous Glacial Varves of Australia Directions of Magnetization in the (E. Irving), 280
Carbons (Graphitic) . Interlayer Spacings of (Prof. P. L. Walker, jun., and George Imperial), (Structure of Graphites), 1184
Carboxamide (4-Amino 5-Imidazole) : Utilization of, in Plant Tissues (Prof. K. V Giri and P. R Krishnaswamy), 1427
Carboxylic Acids : A Convenient Method for Labelling Biologically interesting, with Tritium (N. P Buu-Hoï), 385
Carcass Composition of the East African Dwarf Goat : Effect of Contrasted Planes of Nutrition on the (Dr. P. N. Wilson), 145
Carcinogenesis (4-Dimethylaminoazobenzene), in the Rat Liver : Role of Organ-Specific Antigen during (P E. Hughes, C. J. Louis, J. K. Dineen and W. G. Spector), 289
Carcinogenesis (Mammary), in Mice : Xanthine Oxidase Activity during (I. Lewin, R. Lewin and R. C. Bray), 763
Carcinoma Cells (Ehrlich Ascites) : Effects of Sarcomycin on the Metabolism of (I. J Bickis, Dr. E H Creaser, Prof. J. H Quastel and Dr. P. G. Scholefield), 1109
Carcinoma Cells (Human) : Contamination of Stock Lines of, by Pleuropneumonia-like Organisms (Dr L. H. Collier), 757
Carcinostatic Agent : A New Type of (Prof L. V Heilbrunn, T. R Tosteson, E. Davidson and W. L. Wilson), 924
Cardio-active Principle in Spleen : Occurrence of a (L. B. Cobbin and Prof. R. H. Thorp), 242
Cardiotonic Activity of the Potato-Root Eelworm Hatching Factor (Dr. C. Ellenby and A. B Gilbert), 1105
Care of the Infant Animal : Constitution and (Dr. E. M. Widdowson), 681
Careers : Advice on (National Union of Teachers Pamphlet on), 530
Carleton, Frederick J , and others : Degradation of Biologically Synthesized Lactose labelled with Carbon-14, 915
Carleton, H.M., with the collaboration of Drury, R. A. B. : Histological Technique for Normal and Pathological Tissues and the Identification of Parasites, third edition, *review* by Prof. J. Bronte Gatenby, 1079

Carlile, M. J. : Phototropism of *Phycomyces* Sporangiophores, 202
Carlisle, Dr. D. B. . Chemical Transmission at Nerve Endings (Identity of the Transmitter released from the Pericardial Organs of the Crab's Heart), 627
  Research in Marine Biology (Hormonal Inhibition of Moulting in Decapod Crustacea), 746
  The American Arbacia and other Sea Urchins, *review*, 1268
Carlsberg Foundation and the Wellcome Trustees : Carlsberg—Wellcome Travelling Fellowship Awards for 1957-58, 219
Carlsberg—Wellcome Travelling Fellowships (Carlsberg Foundation and the Wellcome Trustees Awards for 1957-58), 219
Carlsson, Prof. Arvid, and others : 3,4-Dihydroxyphenylalanine and 5-Hydroxytryptophan as Reserpine Antagonists, 1200
Carlucci, Angelo F., and others : Respiratory Characteristics of Marine Bacteria, 1489
Carnegie Institution of Washington : Year Book 1955-56, 79
Carnosinase in Rat Tissue : Carnosine and (T. Wood), 39
Carnosine and Carnosinase in Rat Tissue (T. Wood), 39
Carotene, etc. · Interactions of Chlorophyll in its Triplet State with Oxygen, (Dr. E Fujimori and Prof. Robert Livingston), 1036
Carotene-Protein Complex isolated from Green Leaves (Mitsuo Nishimura and Ken Takamatsu), 699
Carpenter, Martha Stahr, and others : The Large-Scale Structure of the Galaxy, 677
Carpenter, Prof. Philip L. : Immunology and Serology, *review* by Prof. J. R. Marrack, 257
Carpentier, P J., and others : The Sex-linked Difference in Rabbit Neutrophils, 554
Carr, A. T. . Appointed geologist, Uganda, 21
Carr, J. G. (Whiting, Dr. G. C., and) : Chlorogenic Acid Metabolism in Cider Fermentation, 1479
Carr, T. D., and others : Sources of Radio Noise on the Planet Jupiter, 381
Carrier Life-time in Silicon : Effect of Oxygen on the (D. H. Roberts, P. H. Stephens and P. H. Hunt), 665
Carroll, John M : Mechanical Design for Electronics Production, *review* by D. L. Johnston, 1154
Carruthers, B : Studies on Fertility (Methods of Testing for Spermicidal Activity), 226
Carslake, W. D. : Appointed assistant conservator of forests, Sierra Leone, 1454
Carter, Prof. A. D. S. : Appointed professor of mechanical engineering at the Royal Military College of Science, Shrivenham, 1026 ; work of, 1026
Carter, Prof C. F. : Supply of Trained Men and Women, 305
  Capital for Scientific Development, 307
Carter, Prof C. F., and Williams, Prof. B. R. : Industry and Technical Progress—Factors Governing the Speed of Application of Science, *review* by Dr. R. Beeching, 301 ; 305
Carter, Harley : An Introduction to the Cathode Ray Oscilloscope, *review*, 1270
Carter, L. J. (edited by) : Realities of Space Travel—Selected Papers of the British Interplanetary Society, *review* by Prof. D. R. Bates, 453
Carter, Dr. T. C. : Radiation and Biology (Ionizing Radiations and the Socially Handicapped), 629
Cartilage (Ossifying) : Fractionation of Phosphorus Compounds in (R. G. Whitehead and Dr. S. M. Wardman), 1196
Cartilage Homogenate (Epiphyseal) : Glucuronic Acid Formation in (Alessandro A. Castellani, Benedetto de Bernard and Vittorio Zambotti), 859
Cartilage Mucoprotein : Size and Shape of (Dr. Giorgio Bernardi), 93
Cartilage and Nucleus Pulposus . Mucopolysaccharides from (Dr. G. Bernardi, Dr. F. Happey and A. Naylor), 1341
Cartmell, E., and Fowles, Dr. G W. A. : Valency and Molecular Structure, *review* by Prof. J. R. Partington, 109
Cartz, L. · Low-angle X-Ray Observations on Glass, 1115
Case for Science Grants, 1
Case Studies in Automation : Three (Political and Economic Planning), 669
Casey, Rev. Dr. Michael T. : Science in Schools (Science in our Irish Schools), 730
Casimir, Prof : Atoms as Units, 1178
Casley, D J. L. · Appointed statistician, East African High Commission, 1098
Casper, Dr. Franz Tupari (translated by Eric Northcott), *review* by Dr. G. H S Bushnell, 1443
Cassels, Dr. J. M . Spatial Asymmetries in π-μ Decay, 1245
Cassidy, Prof. Harold Gomes : Fundamentals of Chromatography, *review* by Dr. R. Consden, 773
Cassidy, W A : Australites, 636
Castle, A. M , and Orton, Dr. L. H : Appointed joint heads of the Switchgear Department of the Electrical Research Association, 738
Casson, N : Rheology of Disperse Systems (Pigment-Oil Suspensions of the Printing-ink Type), 958
Cast Iron Research Association, British : Open Days (Dr. J. G. Pearce), 222
Castellani, Alessandro A., and others : Glucuronic Acid Formation in Epiphyseal Cartilage Homogenate, 859
Castillejo, L. : Appointed lecturer in mathematical physics at the University of Birmingham, 738
Castillo, José del, and others : Membrane Currents in Clamped Vertebrate Nerve, 1290
Castner Gold Medal for 1958 of the Society of Chemical Industry awarded to Dr. R Holroyd, 1239
Castor Beans : A Mechanism of Conversion of Fat to Carbohydrate in (H. L. Kornberg and H. Beevers), 35
Casuarina : Root Nodules of (G. Bond), 1238
Catalase Activity of Dog Erythrocytes : Genetically-controlled Differences in (Dr. A C Allison and W. ap Rees, and G. P. Burn), 649
Catalyst of Photosynthetic Phosphorylation : Triphosphopyridine Nucleotide as a (Prof. Daniel I. Arnon, Dr. F. R. Whatley and Dr. M. B. Allen), 182, *errata*, 1325
Catalysts (Solid) . Effect of Ionizing Radiation on (R. W. Clarke and E. J. Gibson), 140
Catch Curve of *Culex annulus* in Singapore : Components of the (Donald H. Colless), 1496
Catcheside, Prof. D. G. : Radiation and Biology, 628
  Biology of Yeast (The Genetics of Yeast), 1161
Catchment Areas : Effect of the Afforestation of, upon Water Yield (Dr. P. J. Rennie), 663
Catechol Compounds in Rat Tissues and in Brains of Different Animals (Dr. K. A. Montagu), 244
Catecholamines in the Brain : Intracellular Distribution of (Dr. A. Weil-Malherbe and A D Bone), 1050
Cater, C. W., and others : The Arachin Molecule, 971
Cathode Ray Oscilloscope : An Introduction to the (Harley Carter), *review*, 1270
Cation Exchange Adsorbent (Cellulose) Chromatography of Tobacco Mosaic Virus on a (Prof. George W. Cochran, John L Chidester and Dayna L Stocks), 1281
Cations in Phage Adsorption : Role of, to Sensitive Bacteria (J. Beumer, J. Dirkx and M. P. Beumer-Jochmans), 83
Cations (Foreign), in Silver Azide (Dr. A. D. Yoffe, B. L. Evans and S. K. Deb), 294
Cations (Inorganic) : High-Voltage Paper Electrophoresis of—Alkali, Alkaline-Earth and other Metals (Dr. D Gross), 596
Catsch, Dr. A., and Lê, Du Khuong . Removal of Internally Deposited Radiocerium by the Use of Chelating Agents, 609
Cattanach, B. M : Induction of Translocations in Mice by Triethylenemelamine, 1364
Cattle : Serum Protein Differences in, by Starch Gel Electrophoresis (G. C. Ashton), 917
Cattle (European and Indigenous), in the Tropics : A Difference in the Physiology of the Large Intestine between (Dr J. Quarterman, G. D. Phillips and G. H. Lampkin), 552
Cauliflower (Early Summer) Blindness in (Dr. P. J. Salter), 1056
Causative Organism of Kala-azar . Transaminases of *Leishmania donovani*, the (Dr. A. N. Chatterjee and Dr. J J. Ghosh), 1425
Cave of Niah, Borneo (Tom Harrisson), 1452
Cavell, A. C. : Volumetric Analysis, *review*, 676
  Lecture Experiments in Chemistry, *review*, 878
Cell (Ovarian Interstitial), and the Endothelial Lining of the Blood Sinusoids : Subendothelial Space between the (Dr. M. De Groodt, A. Lagasse and Prof. M Sebruyns), 1431
Cell (Plant) · Ion Permeability of the Plasmalemma of the (N. A. Walker), 94 ; (Prof. G. E. Briggs), 1142
Cell (Red-) Survival in Familial Haemolytic Anaemias (Dr. Robert L Evans), 1435
Cell (Single Nerve), in the Lobster : Two Inhibitory Fibres forming Synapses with a (Dr. A. S. V. Burgen and Dr. S. W. Kuffler), 1490
Cell Compressor for the Measurement of Mass and Concentration by Interference Microscopy (Dr. R. J. Goldacre, Dr. D. M. Easty and Dr. E. J. Ambrose), 1487
Cell Dimensions : Precision Determination of, by the Back-Reflexion Weissenberg Method (F. H. Herbstein), 291
Cell Membrane (Human Red) : Search for a Potassium Compartment in the (A. K. Solomon, June Loucks, Daniel A. Pollen, Thomas J. Gill, 3rd , and Elizabeth Wolf), 993
Cell Wall of *Lactobacillus bifidus* : Composition of the (C. S. Cummins, Miss Olivia M. Glendenning and Dr H. Harris), 337
Cell-Wall Amino-Acids and Amino-Sugars (Dr. M R. J. Salton), 338
Cell-walls (*Spirogyra*) : New Crystallite Orientations of Cellulose I in (Dr. D. R. Kreger), 914
Cells : Lipid Globules in (Dr. John R. Baker), 947
  Vitamin B_{12} Distribution between Plasma and (Herman Baker, Inez Pasher, Dr. Harry Sobotka, S. H. Hutner, Sheldon Aaronson and Herman Ziffer), 1043
Cells of the Chorionic Villi : Determination of the Sex of Human Abortions by Nuclear Sexing the (Prof. A C. Stevenson and R H. McClarin), 198
α-Cells of the Pancreas : Effect of Hypoglycin A on the (Dr. P. C. Feng), 855
Cells (Ascites Tumour), in Mice . A Diurnal Cycle in the Mitotic Activity of (Dr I. P. S. Agrell and Else Welin-Berger), 705
Cells (Ehrlich Ascites Carcinoma) : Effects of Sarcomycin on the Metabolism of (L. J. Bickis; Dr. E. H. Creaser, Prof. J. H. Quastel and Dr. P. G. Scholefield), 1109
Cells (Germ), of *Drosophila melanogaster* · Autonomous Action of Lethal Mutations induced in the, by 2-Chloroethyl Methanesulphonate (C. E. Purdom), 81
Cells (Giant) · Growth of Fowl Plague Virus in Macrophages and (Dr. Richard M Franklin), 510
Cells (Goose) : Use of, in Haemagglutination Tests with Arthropod-borne Viruses (Dr. J. S. Porterfield), 1201
Cells (Human Carcinoma) : Contamination of Stock Lines of, by Pleuropneumonia-like Organisms (Dr. L H Collier), 757
Cells (Intact Liver) : Isolation of (Marjorie V. Branster and Prof R. K. Morton), 1283
Cells (Liver), after Partial Hepatectomy : Deoxyribonucleic Acid Content of the Nucleus of (R. Laquerrière), 1199
Cells (Mammalian Red) · Quantity of Radioactive Lecithin and Radioactive Cephalin with Lipositol required to produce Sphering of (Dr Eric Ponder and Ruth V. Ponder), 814
Cells (Mast) : Secretion of Heparin by (Dr. M. Hill), 654
Cells (Mast), in the Epithelium of the Œsophagus (Dr. F. R. Johnson and R M. H. McMinn), 615
Cells (Mucous Gland), of the Outer Mantle Epithelium of *Arca noae* (E. R. Trueman), 1492
Cells (Nerve) The Physiology of (Prof. John Carew Eccles), *review* by Prof Ragnar Granit, 724
Cells (Plant) : An Effect of pH on the Uptake of Salt by (R. G. Hurd and Dr. J F. Sutcliffe), 233
  Lethal Effects on, of Fungal and Bacterial Extracts (S. G. Fushtey), 20
Cells (Red) : Surface Alteration and the Agglutinability of (Prof Merwin Moskowitz and Saul Carb), 1049
Cells (Root), of *Pisum* : Intracellular Incorporation of Iron-59 into the (J. V. Possingham and R Brown), 653
Cells (Tumour) : Distribution of Ribonucleic Acid in, during Mitosis (Dr. Robert Love), 1338
Cells (Yoshida Sarcoma) : Effects of Kinetin on Division of (Yoshito Ogawa, Yukihide Abe and Kenjiroo Fujioka), 985
Cellular Nucleic Acids : Changes in, during Infection with Poliomyelitis Virus as studied by Fluorescence Microscopy (Dr. Esther Tenenbaum), 1044
Cellular Pathology : New Pathways in (Prof. Gordon Roy Cameron), *review* by Prof. J. H. Gaddum, 59
Cellular Potentials (Atrial) : Effect of Acetylcholine and Quinidine on (Dr. Edward A. Johnson and Dr. P. A. Robertson), 1483

Cellular and Virus Nucleic Acids : Histochemical Observations on (Fluorescence Microscopy in the Study of Nucleic Acids), (Dr. J. A. Armstrong and Dr. Janet S. F. Niven), 1335
Cellulose I : New Crystallite Orientations of, in *Spirogyra* Cell-walls (Dr. D. R. Kreger), 914
α-Cellulose (Jute) : Examination of the Oligosaccharides isolated from (W. G. Macmillan, A. B. Sen Gupta and A. S. Dutt), 1041
Cellulose Cation Exchange Adsorbent : Chromatography of Tobacco Mosaic Virus on a (Prof. George W. Cochran, John L. Chidester and Dayna L. Stocks), 1281
Cellulosic Fibres in Contact with Rusting Iron : Degradation of (W. A. Bell and Jean M. Gibson), 1065
Cement and Concrete Association : Research Division of the, 175
Centenary of the British Ornithologists' Union, 1169.
Centenary of the Brown Library and its Satellites, 1857-1957 (Dr. G. Chandler), 20
Centenary of the Science Museum, 121
Centenary of the Société Chimique de France, 1165
Centimetric Radars : 'Angels' on, caused by Birds (W. G. Harper), 847
Centipede (Marine) : Feeding Habits of a (J. Gordon Blower), 560
Centlivres, Hon. A. van der Sandt : *Apartheid*, 686
Centola, Prof G., and Borruso, Dr. D. : Fundamental Aspects of Fibres and their Treatment for Papermaking (Process of Beating—Influence on Beating of certain Electrolytes and Substantive Azo-dyes), 1177
Central Africa : Research in, 837
Centre National de la Recherche scientifique : Colloque sur la Biochimie du Soufre, Roscoff, 1956, 466
  International Colloquium on Interference Spectroscopy, 955
Cephalin (Radioactive), with Lipositol . Quantity of Radioactive Lecithin and, required to produce Sphering of Mammalian Red Cells (Dr. Eric Ponder and Ruth V. Ponder), 814
Cereal Forage : Effect of Leaf Rust on (A F. Greenall), 1000
Cerebral Cortex : The Organization of the (Dr. D. A. Sholl), *review* by Prof. B. Delisle Burns, 106
Cerebral Cortex (Limbic Structures) : Studies on the (Santiago Ramón y Cajal), translated from the Spanish by Lisbeth M. Kraft, *review* by Prof. B. Delisle Burns, 106
Cerebral Lesions : Effect of, upon Œstrus in Ferrets (J. Herbert and Sir Solly Zuckerman), 547
Cerf, Dr. R. : Macromolecular Chemistry (Flow Birefringence of Macromolecular Solutions), 842
Cerianthus : Responses of, to Stimulation (Dr. D. M. Ross), 1368 ; (Dr. G. A. Horridge), 1369
Ceric-Cerous System at High Dose-Levels of Cobalt-60 γ-Rays : Response of the (B. Whittaker), 1302
Cerium-(Radio-) : Removal of Internally Deposited, by the Use of Chelating Agents (Dr. A. Catsch and Du Khuong Lê), 609
Certificate Courses (National) : Electro-Technology for (Dr. H. Buckingham and E. M Price), Vol. 2, *review* by Dr. P. F. Soper, 1309
Cessation of Hibernation : Onset and, under Constant Temperature and Light in the Golden-mantled Ground Squirrel (*Citellus lateralis*), (Eric T. Pengelley and Prof. Kenneth C Fisher), 1371
Cester, C., and others : Combined Light and Velocity Measurements of the Variable Star 12 Lacertae, 1112
Chabbal, R., and Soulet, M. : Interference Spectroscopy, 955
Chace, W. G., and others : Ionization Phenomena in Gases (Explosion of Wires by Discharges from Heavy Condensers), 793
Chaetomorpha melagonium (Cladophorales) : Wall Deposition in (Dr. E. Nicolai), 491
Chain of Life : The Great (Joseph Wood Krutch), *review* by T. H. Hawkins, 1268
Chain-like Polyelectrolyte Molecules : Influence of Ion Exchange on Size and Shape of (R. E. Cooper and Dr. A. Wassermann), 1072
Chalk at Flamborough, Yorkshire : Velocity of Compressional Waves for a Stratigraphic Profile of (A. S. Laughton and A. H. Stride), 977
Chalmers, Dr. J. Alan : Atmospheric Electricity, *review* by Dr. B. J. Mason, 402
Chaloner, S. E : Safety in the Chemical Industry (Responsibility of the Plant Manager and the Safety Officer, and others), 1398
Chalvignac, Dr. M. A. : Methods of Studying the Microbiology of Soils (Methods of Counting Soil Bacteria), 591
Chamberlain, R. : Useful Fungi, *review*, 936
Chambers, P. L. : Appointed to the John Stokes Research Fellowship to be held in the Department of Physiology, University of Sheffield, 893
Chambers, Dr Robert : *Obituary* by Sir James Gray, 1167
Chambers, Dr. R. G. : Keeping Up with Low-Temperature Physics, *review*, 107
  Low-Temperature Physics (Cyclotron Resonance in Bismuth), 461
Champernowne, Prof. D. G. : Model Building for Economists, *review*, 876
Champigny, Mlle M. L. : Vegetable Quality (Formation of Amino-Acids during Photosynthesis in Crassulaceae), 174
Chance, Prof Britton, and Strehler, Bernard : Effects of Oxygen upon Light Absorption by Green Algae, 747
Chandler, Dr. G. : Centenary of the Brown Library and its Satellites, 1857-1957, 20
Chandra, D. : Anisotropy of Sclerotinites, 297
Changes in Cellular Nucleic Acids during Infection with Poliomyelitis Virus as studied by Fluorescence Microscopy (Dr. Esther Tenenbaum), 1044
Changes in Diurnal Variation : Travelling Disturbances in the Ionosphere—(Dr. G. H. Munro), 1252
Changes in the Intestinal Mucosa of the Sheep following Death by Humane Killer (A. M. Badawy, R. M. Campbell, Dr. D. P. Cuthbertson and B. F Bell), 756
Changes which occur after Nerve Section : Histochemical Appearances of Cholinesterase in the Normal Sciatic Nerve and the (Dr. R. S. Snell), 378
Changes of Organic Phosphate Esters during Glycolysis in Blood followed by a Paper Chromatography Method (Dr. L. Macho), 1351
Changes in Response to Light Stimuli of the Larvae of *Culicoides circumscriptus* (Dr. P. Becker), 559
Changes in the Structure of Carbon during Oxidation (J. D. Watt and Dr. Rosalind E. Franklin), 1190
Changes (Morphological), of Tubercle Bacilli caused by Staining Procedures (Prof. T. Ebina, C. Shinohara, H. Saito, K. Fukushi and J. Suzuki), 42
Changes (Secular), of the Units and Constants of Physics (A. H. Cook), 1194
Changes (Serological), concomitant with the Growth of Mouse Tumours in Pretreated Rats (M. Pikovski, C. Tal, M. Schlesinger and E. Margolinsh), 185
Channon, J A. : Appointed senior meteorologist, East African Meteorological Department, 1454
Chant, S. R. : A Die-back of Cacao Seedlings in Nigeria caused by a Species of *Phytophthora*, 1494
Chapman, E. W. : Appointed assistant conservator of forests, Kenya, 1454
Chapman, Prof. Sydney : *Obituary* of Prof. Carl Stormer, 633
Chapman, Victor (Riley, Dr. Ralph, and) : Chromosomes of the Potato Root Eelworm, 662
Chapman, Dr. W. A. J. : Hatfield Technical College, 365
Character (An Inherent), of Plant Species of Drier Habitats (Dr. M. L. R. Petterson, S. K. F. Ellis, G. E. J. Gray and R. S. Smith), 698
Characteristics (Dental), of an Eskimoid People : The Aleut Dentition—a Correlative Study of (Dr. Coenraad F. A. Moorrees), *review* by F. Taylor Monks, 1380
Characteristics (Differential Thermal), of Peat (B. D. Mitchell), 1414
Characteristics (Respiratory), of Marine Bacteria (Joseph R. Merkel, Angelo F. Carlucci and Prof David Pramer), 1489
Characterization of 2-Amino-2-Deoxy-D-Altrose (Dr. A. B. Foster, Prof. M. Stacey and S. V. Vardheim), 247
Characterization (Chromatographic), of Soluble Deoxypolynucleotides released in Mouse Spleen by X-Irradiation (Dr. R. K. Main, L. J. Cole and M. E. Ellis), 1285
Chargaff, Prof. Erwin, and others : Protoplasts of *Escherichia coli* as Sources and Acceptors of Deoxypentose Nucleic Acid—Rehabilitation of a Deficient Mutant, 851
Charged Particles in a Non-uniform Radio-frequency Field (Dr. H. A. H. Boot and R. B. R.-S. Harvie), 1187
Charing Cross Hospital Medical School, London : Title of reader in pharmacology in the University of London conferred on Dr. J. B. E. Baker, 316
  Title of reader in anatomy in the University of London conferred on Dr. T. W. Glenister, 316
Charles, Arwyn : Ultra-thin Serial Sectioning with Rocking Microtomes, 1302
Charlesby, Dr. Arthur : Appointed professor of physics at the Royal Military College of Science, Shrivenham, 1026 ; work of, 1026
Charlesby, Dr. Arthur, and others : Rheology of Elastomers (Irradiated Rubbers), 76
Charley, Dr. V. L. S. : Some Nutritional and Allied Problems confronting the Food Manufacturers, I, Colours and Flavours, 1244
Charlton, T. M. : Research on Roads in Britain, 588
Charney, Dr. J. G. : Planetary Atmospheres and Convection in Rotating Fluids (Theory of the General Circulation of the Atmosphere), 1459
Chase, Dr. H. : Biology of Hair Growth (Sheaths of Cells which form the Hair and the Inner Root Sheath), 593 ; (Possible Ways in which a Resting Follicle may be stimulated to begin a New Phase of Growth), 593
Chaston, Dr. J. C., and Sloboda, M. H., : Wetting and Spreading of Liquid Metals on Solid Metal Surfaces (Fluxing of Stainless Steel), 1156
Chatterjee, Dr. A. N., and Ghosh, Dr. J. J. : Transaminases of *Leishmania donovani*, the Causative Organism of Kala-azar, 1425
Chatterjee, Dr. K. R. (Poddar, R K, and) : Autoradiographic Detection of Sulphone in the Affected Tissues of Leprosy Patients, 854
Chatterjee, Prof. S. D. : Given an award under the Royal Society and Nuffield Foundation Commonwealth Bursaries Scheme, 119
Chaudhuri, Jayanti Nag (Basu, Dr. Sadhan, and) : Group Localization Energy and Polarographic Half-Wave Potentials of Aromatic Nitro Compounds, 1473
Chaudron, Prof. G. : Presented with the Grand Medal of the Société Française de Métallurgie, 219
Chayen, L H. : Recent Advances in Gelatin and Glue Research, 690
Chayen, Dr. J., and others : Uptake of Benzpyrene by a Chromosomal Phospholipid, 652
Chazyan and related Brachiopods (Dr. G. A. Cooper), *review* by Prof. Alwyn Williams, 401
Cheesman, Miss L. E. : Biogeographical Significance of Aneityum Island, New Hebrides, 903
Chelates (Yttrium and Lanthanum), of CycloHexane 1,2-*Trans* Diamine Tetraacetic Acid and Diethylenetriamine Pentaacetic Acid : Excretion of, in Man (Dr. Harry Kroll, Dr. Samuel Korman, Dr. Elsie Siegel, Dr. Hiram E. Hart, Dr. Betty Rosoff, Dr. Herta Spencer and Dr. Daniel Laszlo), 919
Chelating Agents : Effect of Copper and, on Growth Inhibition of *Aspergillus niger* by 8-Hydroxyquinoline and Pyridine-*N*-Oxide-2-Thiol (Dr. A. Kaars Sijpesteijn, M. J. Janssen and (in part) H. M Dekhuyzen), 505
  Removal of Internally Deposited Radiocerium by the Use of (Dr. A. Catsch and Du Khuong Lê), 609
Chelating or Complexing Agents : Formation of Liesegang-like Rings by Metal Ions and (Prof. Robert E. Feeney and Nelle Bennett), 979
Chelation of Zinc : Dwarf *Drosophila* produced by Ethylene Diamine Tetraacetic Acid—a Relationship to (Dale Steffensen), 390
Chemical Additives in Food : Control of (Food Law Institute of the United States, the Food Group of the Society of Chemical Industry, the Society for Analytical Chemistry and the Association of Public Analysts of Great Britain Joint Discussion on), 692
Chemical Analyses : Quantitative (Cumming and Kay), eleventh edition revised by Dr. Robert Alexander Chalmers, *review* by Dr. K. Field, 109
  Quantitative (Prof. Robert B. Fischer), *review* by G. Fowles, 676
Chemical Analysis (Qualitative Organic) : A Guide to (Prof R. P. Linstead and Dr. B. C. L. Weedon), *review* by Dr. W. J. Hickinbottom, 567
Chemical Approaches to the Investigation of Lung Cancer (Dr. J. W. Cook), 479
Chemical Basis of Blood Group Specificity, *review* by Dr. Winifred M. Watkins, 5
Chemical Difference between Normal and Sickle Cell Haemoglobin : Gene Mutations in Human Haemoglobin—the (Dr. V. M. Ingram), 326
Chemical Engineering at Birmingham, 465
Chemical Engineering : Solid Systems in, *review* by Prof. J. M. Coulson, 823
Chemical Engineering, Canadian Journal of (Chemical Institute of Canada), 19
Chemical Engineering Education (Symposium at the University of Birmingham), 125

Chemical Engineering Practice (edited by Herbert W. Cremer and Trefor Davies), Vol. 3, Solid Systems, *review* by Prof. J. M. Coulson, 823
Chemical Engineers, Institution of: Joined to the European Federation of Chemical Engineering, 953
Chemical Engineers, Institution of (Low Temperature Group of the Physical Society and the): Conference on Recent Developments in Industrial Low Temperature Gas Separation, 270, 1028
Chemical Examination of the Water of Flooded Rice Fields (R. Vámos), 1484
Chemical Industry: Safety in (Chemical Engineering Group and the London Section of the Society of Chemical Industry Symposium on), 220, 1397
Chemical Industry, Society of: Reports on the Progress of Applied Chemistry, Vol. 40, 1955 (edited by H. S. Rooke), *review* by Prof. J. R. Partington, 59
  Conference on Industrial Carbon and Graphite, 316
  Programme of Scientific Films in Colour, 1028
  Castner Gold Medal for 1958 awarded to Dr. R. Holroyd, 1239
Chemical Industry, Society of (Agriculture Group and the Bristol Section): Symposium on Trace Elements in Soils, Plants and Animals, 23
Chemical Industry, Society of (Chemical Engineering Group and the London Section): Symposium on Safety in Chemical Industry, 220, 1397
Chemical Industry, Society of (Nutrition Panel of the Food Group): Meetings on Some Nutritional and Allied Problems confronting the Food Manufacturers, 1, Colours and Flavours, 1242
Chemical Industry, Society for (Plastics and Polymer Group): Symposium on the Physical Properties of Polymers, 467
Chemical Industry, Society of (Food Group), (Association of Public Analysts of Great Britain and the): Joint Discussion on Quality Control of Food, 1326
Chemical Industry, Society of, and others: Joint Symposium on the Newer Metals, 637
Chemical Industry, Society of (Food Group), and others: Joint Discussion on the Control of Chemical Additives in Food, 692
Chemical Institute of Canada: *Canadian Journal of Chemical Engineering*, 19
Chemical Institute of Canada (National Research Council of Canada and the): Eighth Canadian High Polymer Forum, 838
Chemical Mechanism of Permanent Set (R. S. Asquith, Prof. J. B. Speakman and E. Tolgyesi), 502
Chemical Model of a Biological Reaction (Prof. Alexander Gero and Curtis L. Withrow), 1354
Chemical Modification: Intestinal Damage by Radiation and its (R. H. Mole and Diana M. Temple), 1278
Chemical Nature of the Fluorescent Pigment produced in *Microsporum*-infected Hair (Prof. Frederick T. Wolf), 860
Chemical Nature of Parathyroid Hormone (Howard Rasmussen and Roland Westall), 1429
Chemical Reactions: Encyclopedia of (compiled by Prof. C. A. Jacobson), edited by Clifford A. Hampel, Vol. 6, Samarium, Scandium, Selenium, Silicon, Silver, Sodium, *review* by Prof. W. Wardlaw, 6
  Some Observations on the Mechanism of (Sir Cyril Hinshelwood), 1233
Chemical Reactions (Radiation-Induced): Dose-Rate Effects in (Dr. H. C. Sutton and Prof. J. Rotblat), 1332
Chemistry Research 1956—the Report of the Chemistry Research Board with the Report of the Director of the Chemical Research Laboratory, 80
Chemical Research Laboratory, Teddington: Report for 1956, 80
  Open Days, 122, 531, 954
Chemical Shifts in $C_5H_5^-$ and $C_7H_7^+$ Ions—the Free Electron Model (J. R. Leto, F. A. Cotton and Dr. J. S. Waugh), 978
Chemical Society: Grants from the Research Fund, 413
  Symposium on Recent Advances in the Chemistry of Terpenoid Compounds, 470
  Corday—Morgan Commonwealth Fellowship in Chemistry, 585
Chemical Society (Queen Mary College, London, under the auspices of the): Symposium on Solvent Effects and Reaction Mechanism, 534
Chemical Society, and others: Joint Symposium on the Newer Metals, 637
Chemical Society of France, 1857-1957 (Prof. J. R. Partington), 1165
Chemical Synthesis (K. Matsuda), 985
Chemical Thermoregulation in Piglets: Development of (Dr. A. Holub, Z. Forman and D. Jezková), 858
Chemical Transmission at Nerve Endings (Sir Lindor Brown), 484, 627
Chemical Treatment: Difference in the Behaviour of Tissues in Ancient Plant Remains and during (K. A. Chowdhury, S. S. Ghosh, R. V. Bhat and G. M. Vyas), 612
Chemically Defined Media: Cultivation of Embryonic Chick Bones on (Dr. J. D. Biggers, Dr. M. Webb, and Dr. Raymond C. Parker and George M. Healy), 825
Chemicals (Coal), in the National Economy: Coal and (Dr. J. Bronowski), 636
  Dalton Exhibition of the Royal Institute of Chemistry, 637
Chemistry at Auckland University College, New Zealand, 69
Chemistry in Manchester, 360
Chemistry, the Conquest of Materials (Kenneth Hutton), *review* by G. Fowles, 352
Chemistry: Corday—Morgan Commonwealth Fellowship in (Chemical Society), 585
  Elementary Practical Organic (Dr. Arthur I. Vogel), Part 1, Small Scale Preparations, *review* by G. Fowles, 569
  Encyclopedia of (edited by Prof. George L. Clark and Gessner G. Hawley), *review* by Prof. J. R. Partington, 569
  High Polymer, Colloid and Surface (South Australian Branch of the Royal Australian Chemical Institute Discussion on), 959
  Lecture Experiments in (G. Fowles), fourth edition, *review* by A. C. Cavell, 878
  Macromolecular (Macromolecular Commission of the International Union of Pure and Applied Chemistry Tenth International Symposium on), 841
  Organic (Louis F. Fieser and Mary Fieser), third edition, *review* by Prof. J. R. Partington, 352
  Physical Organic (Prof. Jack Hine), *review* by Prof. J. R. Partington, 159
  Quantum (Walter Kauzmann), *review* by Prof. C. A. Coulson, 1262
Chemistry, Royal Institute of: Dalton Lecture (Dr. J. Bronowski), 636
  Dalton Exhibition (Coal and Coal Chemicals in the National Economy), 637
Chemistry, Royal Institute of, and others: Joint Symposium on the Newer Metals, 637
Chemistry of Condensed Tannins: Some Recent Advances in the Identification of Leuco-Anthocyanins and the (Dr. David G. Roux), 973
Chemistry of the Coordination Compounds (edited by John C. Bailar, Jr.), *review* by Dr. R. J. Magee, 725
Chemistry of High Polymer Degradation Processes (Dr. Norman Grassie), *review* by Prof. C. E. H. Bawn, 672
Chemistry of Metals: The Physics and (Prof. N. F. Mott), 272
Chemistry of Phenolic Resins (Robert W. Martin), *review* by Prof. C. E. H. Bawn, 672
Chemistry of Plastics (Symposium at the Bradford Institute of Technology), 1454
Chemistry in the Service of Man (Prof. Alexander Findlay), eighth edition, *review*, 774
Chemistry of Sight, *review* by Dr. Ruth Hubbard, 1258
Chemistry of Terpenoid Compounds: Recent Advances in the (Chemical Society Symposium on), 470
Chemistry (Analytical), Society for (Midlands Section and Microchemistry Group): Symposium on Microchemistry, 72
Chemistry (Analytical), Society for (Scottish Section): Congress on Modern Analytical Chemistry in Industry, 366
Chemistry (Analytical), Society for, and others: Joint Discussion on the Control of Chemical Additives in Food, 692
Chemistry (Applied): Reports on the Progress of, Vol. 40, 1955 (edited by H. S. Rooke), *review* by Prof. J. R. Partington, 59
Chemistry (Horticultural), at Bristol, 267
Chemistry (Industrial): Development of, *review* by Prof. John Read, 723
  A History of (Dr. F. Sherwood Taylor), *review* by Prof. John Read, 723
Chemistry (Inorganic and Theoretical): Supplement to Mellor's Comprehensive Treatise on (prepared under the direction of an Editorial Board), Supplement 2, Part 1, F, Cl, Br, I, At, including the Radiochemistry and Radiation Chemistry of the Halogens, *review* by Prof. J. R. Partington, 258
Chemistry (Macromolecular): Proceedings of the International Symposium on, 1172
  Light Scattering and, *review* by Dr. G. Allen, 5
Chemistry (Modern Analytical), in Industry (Scottish Section of the Society for Analytical Chemistry Congress on), 366
Chemistry (Nuclear), and Effects of Irradiation (Proceedings of the International Conference on the Peaceful Uses of Atomic Energy, Geneva, 1955, Vol. 7), *review* by Dr. T. E. Allibone, 771
Chemistry (Organic), at Belfast, 1025
Chemistry (Organic), at Glasgow, 1025
Chemistry (Organic): Introduction to Structure in (Prof. C. K. Ingold), *review* by G. Fowles, 453
  The Reactive Intermediates of (John E. Leffler), *review* by H. S. Turner, 1269
  Steric Effects in (edited by Melvin S. Newman), *review* by Dr. P. B. D. de la Mare, 822
  Technique in, *review* by Dr. W. J. Hickinbottom, 567
  Technique of (edited by Arnold Weissberger), Vol. 3, second edition, Part 1, Separation and Purification, *review* by Dr. W. J. Hickinbottom, 567
Chemistry (Peptide and Protein): Thiols, Disulphides and Thiosulphates—some New Reactions and Possibilities in (Dr. J. M. Swan), 643
Chemistry (Physical): Experimental (Prof. Farrington Daniels, Prof. Joseph Howard Mathews, Prof. John Warren Williams, Prof. Paul Bender and Prof. Robert A. Alberty), fifth edition, *review* by Dr. E. F. G. Herington, 209
  Light-Scattering in (Dr. K. A. Stacey), *review* by Dr. G. Allen, 5
Chemistry (Physical), for Students of Pharmacy and Biology (Dr. S. C. Wallwork), *review* by G. Fowles, 1269
Chemistry (Polymer): Textbook of (Fred W. Billmeyer, Jr.), *review* by Prof. C. E. H. Bawn, 672
Chemistry (Pure and Applied), International Union of: Symposium on Geochemistry, 583
Chemistry (Pure and Applied), International Union of (Macromolecular Commission): Tenth International Symposium on Macromolecular Chemistry, 841
Chemistry (Retinal), and the Physiology of Vision (Prof. G. Wald), 1395
Chemistry (Theoretical and Inorganic): A Text Book of (F. A. Philbrick and Dr. E. J. Holmyard), new revised edition by Dr. E. J. Holmyard and Dr. W. G. Palmer, *review* by G. Fowles, 878
Chemistry Research Board: Report for 1956, 80
Cheradame, M.: From Coal to Coke (Sixth Coal Science Lecture of the British Coal Utilization Research Association), 891
Chermin, H. A. G., and others: At the Second International Conference on Coal Science (Dilatation of various blends of Coals and Coke on Heating), 419
Cheronis, Prof. Nicholas D., and Entrikin, Prof. John B.: Semimicro Qualitative Organic Analysis, second edition, *review* by Dr. W. J. Hickinbottom, 567
Cherrett, J. M.: Awarded a Nature Conservancy Research Studentship for Postgraduate Training in Ecology (Zoology), 467
Cherry, Dr. Colin: On Human Communication, *review* by J. T. Allanson and Prof. Alan S. C. Ross, 255
Cherwell, Rt. Hon. Viscount: *Obituary* by Prof. R. V. Jones, 579
Cherwell, Lord (Dr. H. R. Calvert), 1146
Cherwell Fellowship awarded to Dr. H. G. Kuhn by the William Waldorf Astor Foundation of New York, 1325
Cheshire, J. D. (Scott, R. P. W., and): High-Efficiency Columns for the Analysis of Hydrocarbons by Gas-Liquid-Chromatography, 702
Cheyletidae (Acarina, Arachnida): Silk Production in the (A. M. Hughes), 815
Chiasmata in an 'Asynaptic' Locust: Distribution of (Dr. H. Rees), 559
Chick, D. R., and Hunt, S. E.: Excited Levels in Arsenic-75 produced by Radiative Capture of Protons by Germanium-74, 88
Chick, D. R., and others: An Experimental Proton Linear Accelerator using a Helical Waveguide, 432
Chick, Dame Harriette: Flour and Bread (History of Wheat Cultivation and Bread-making from Antiquity Onwards), 317
Chick Bones (Embryonic): Cultivation of, on Chemically Defined Media (Dr. J. D. Biggers, Dr. M. Webb, and Dr. Raymond C. Parker and George M. Healy), 825
Chick Embryo: Teratogenic Effects of Beta-Amino-Propionitrile in the (Ellis E. Rosenberg), 706

Chick Embryos (Young) : Absence of Wound Healing in (Prof. Paul Weiss and A. Gedeon Matoltsy), 854
Chicken Cholinesterase : Insensitivity of, to Specific Inhibitors of True- and Pseudo-Enzyme (Prof. W. Ferrari), 144
Chicken Tissues (Normal) : Internal Structure of the Virus-like Particles associated with the Rous Sarcoma, and their Presence in other Neoplastic and (Prof Ch. Oberling, W. Bernhard and Ph. Vigier), 386
Chidester, John L , and others : Chromatography of Tobacco Mosaic Virus on a Cellulose Cation Exchange Adsorbent, 1281
Childhood : Accidents in—Facts as a Basis for Prevention (World Health Organization, Technical Report Series No. 118), 371
Chiltz, G., and others : Photochlorination of Chloroform, 1068
China, Dr. W. E. Appointed a deputy chief scientific officer at the British Museum (Natural History), 122
China (North-eastern) : Occurrence of the Muskrat in Hu Ma District (Prof. T H. Shaw), 1215
Chino, Haruo . Conversion of Glycogen to Sorbitol and Glycerol in the Diapause Egg of the *Bombyx* Silkworm, 606
Chirality (L. L. Whyte), 513
Chirnside, R C. : Modern Analytical Chemistry in Industry (Analyses as a Research Service to Chemical Problems in the Electrical Industry), 367
Chitin (Crustacean) : Application of Ethylenediaminetetra-acetic Acid in the Isolation of (Dr. A. B. Foster and R. H. Hackman), 40
Chlamydomonas moewusii : Tactic Movements in (Dr. A. M. Mayer and A. Poljakoff-Mayber), 927
Chloride Crystals (Alkali), in the presence of Nucleoprotein Microfibrils : A Lattice Distortion of (J C White and P. C. Elmes, and V. Balashov, Prof R. D. Preston and G. W. Ripley), 696
Chloride Regulation in Marine Fish Larvae Site of (J E. Shelbourne), 920
2-Chloroethyl Methanesulphonate : Autonomous Action of Lethal Mutations induced in the Germ Cells of *Drosophila melanogaster* by (C. E. Purdom), 81
Chloroform : Photochlorination of (G. Chiltz, G. Martens and A. M. Mahieu), 1068
Chlorogenic Acid : Determination of (Dr. A. S Weaving), 1287
  Phosphorylase Inhibitor in Potato—Separation from Activator and Possible Relation to (Dr. Sigmund Schwimmer), 149
Chlorogenic Acid Metabolism in Cider Fermentation (Dr. G. C. Whiting and J G Carr), 1479
Chloro-organic Acids : Decomposition of, by Fungi (Prof. H. L. Jensen), 1416
Chlorophyll : Two Species of *Trachelomonas* (Euglenineae) without (Prof. E. G. Pringsheim), 1296
Chlorophyll in its Triplet State : Interactions of, with Oxygen, Carotene, etc (Dr. E Fujimori and Prof Robert Livingston), 1036
Cholesterol Metabolism · Effect of Different Dietary Fats on the Faecal End-Products of (H. Gordon, B. Lewis, L. Eales and Prof J. F. Brock), 923
Choline Esters : Muscarinic Action of Murexine and some related (Dr. Martin M. Winbury), 988
Choline-Oxidase Activity of Host-Livers of Tumour-bearing Animals (M. V. Narurkar, U. S Kumta and M. B. Sahasrabudhe), 1128
Cholinesterase in the Normal Sciatic Nerve : Histochemical Appearances of, and the Changes which occur after Nerve Section (Dr R. S. Snell), 378
Cholinesterase Content of the Dog's Lymphocytes and Polynuclears (Dr. A. J. Philippu), 438
Cholinesterase (Chicken) : Insensitivity of, to Specific Inhibitors of True- and Pseudo-Enzyme (Prof W. Ferrari), 144
Chollet, P., and Tardif, H. P. · Softening of Steels by Cold-Working, 754
Chorionic Villi : Determination of the Sex of Human Abortions by Nuclear Sexing the Cells of the (Prof. A. C. Stevenson and R. H. McClarin), 198
Chorley, Lord : University Apartheid in South Africa, 1164
Chorus' ('Dawn) : Diurnal Variation in the Occurrence of (Joseph H. Pope), 433
  in Radio Observations (G. A. Isted and G. Millington), 716
Choubert, Georges : Correlation between the Marine and Continental Cycles of the Pleistocene Period in Morocco, 1171
Chowdhury, K. A., and others : Difference in the Behaviour of Tissues in Ancient Plant Remains and during Chemical Treatment, 612
Chown, Dr Bruce, and others : A 'New' Kell Blood-Group Phenotype, 711
Chree (Charles) Medal and Prize of the Physical Society presented to Dr. D. F. Martyn, 531
Christensen, Dr. G N. : Fundamental Aspects of Fibres and their Treatment for Papermaking (Chemistry of Pulp Fibres—Reaction Wood), 1176
Christian Belief : Evolutionary Theory and (Dr. David Lack), *review* by the Rev. Dr. E. L. Mascall, 671
Christian Faith and the Freedom of Science (Dr R. Hooykaas), 71
Christian Philosophy of St. Thomas Aquinas (Etienne Gilson), translated by L K. Shook, *review* by the Very Rev. W. R. Matthews, 873
Christiansen, W. N., and others : Radio Pictures of the Sun, 944
Christmas Disease : A Hitherto Unknown Blood Clotting Defect in Haemophilia and (Dr. F. Nour-Eldin and Dr. John F. Wilkinson), 990
Christmas Lectures at the Royal Institution, 1239
Christmas Lectures for Junior Audiences (British Museum (Natural History)), 1394
Christopherson, Prof. D. G. · Lubrication and Wear (Hydrodynamic Lubrication), 1448
Chromate Solutions : Passivation of Iron by (Miss D M. Brasher, A. H. Kingsbury and A. D. Mercer), 27 ; (Miss D M. Brasher and C. P. De), 28
Chromatograms (Paper) : Differentiation of α-Amino-Acids and Amines by Non-Enzymatic Transamination on (Dr. G. D Kalyankar and Prof Esmond E. Snell), 1069
  A Rapid Procedure for the Separation of Amino-Acids on (Henry R. Roberts and Michael G Kolor), 384
Chromatographic Analysis (Ionophoretic and), of Single Dust Particles (B. M. Turner), 1472
Chromatographic Characterization of Soluble Deoxypolynucleotides released in Mouse Spleen by X-Irradiation (Dr. R. K. Main, L. J. Cole and M. E. Ellis), 1285
Chromatographic Columns (Gas) : A Performance Index for (Marcel J. E. Golay), 435
Chromatographic (Post-) Enzymatic Technique : Detection of the Substrate of Enzymic Browning in Cacao by a (Dr. L. A. Griffiths), 1373
Chromatography, a Review of Principles and Applications (Prof. Edgar Lederer and Michael Lederer), second edition, *review* by Dr. R. Consden, 773
Chromatography : Conical Paper (Dr. Yoshinobu Osawa), 705
  Fundamentals of (Prof. Harold Gomes Cassidy), *review* by Dr. R. Consden, 773
  Gas (N. H. Ray), 403
  Gas (Gas Chromatography Discussion Group of the Institute of Petroleum and the Koninklijke Nederlandse Chemische Vereniging Symposium on), 838
  Gas (Analysis Instrumentation Division of the Instrument Society of America International Symposium on), 840
Chromatography by Liquid—Liquid Partition and Liquid—Liquid Interface Adsorption (H. van Duin), 1473
Chromatography of Tobacco Mosaic Virus on a Cellulose Cation Exchange Adsorbent (Prof. George W. Cochran, John L. Chidester and Dayna L. Stocks), 1281
Chromatography (Anion Exchange), and Molecular Size of Deoxyribonucleic Acid (Morton Rosoff, Giampiero di Mayorca and Aaron Bendich), 1355
Chromatography (Column) · A Moving-Paper Collector for (Dr. E. A. Bell), 190
Chromatography (Gas) : Column Packings for (Symposium on, organized by the Gas Chromatography Discussion Group under the auspices of the Hydrocarbon Research Group of the Institute of Petroleum), 220
  First International Symposium on (Analysis Instrumentation Division of the Instrument Society of America), 220
  A Hydrogen-Conversion Detector for (G. E. Green), 295
  Instrumentation for, 530
  Scott Microflame Detector for (Shandon Scientific Co., Ltd.), 530
  Vapour Detectors for (Gas Chromatography Discussion Group of the Institute of Petroleum Symposium on), 22
Chromatography (Gas-Liquid) . High-Efficiency Columns for the Analysis of Hydrocarbons by (R. P. W. Scott and J. D. Cheshire), 702
Chromatography (Paper) : Separation and Identification of Aromatic Acids in Plant Tissues by (Dr. L. A Griffiths), 286
Chromatography (Paper), in Taxonomic Work (Dr. C. A Wright, R. H. Harris and D Claugher), 1489
Chromatography Method (Paper) : Changes of Organic Phosphate Esters during Glycolysis in Blood followed by a (Dr. L. Macho), 1351
Chromium : Recrystallization and the Ductility of (S. T M. Johnstone, F. Henderson and H. L. Wain), 806
  Strain—Age Hardening and Brittleness in (C. W. Weaver), 806
Chromium deposited from an Electrolyte containing Fluoride : Some Properties of (N. E. Ryan, F. Henderson, S. T. M. Johnstone and H. L. Wain), 1406
Chromium Crystals (Hexagonal), from Fused Electrolytes (Dr. R. S. Dean and F X McCawley), 435
Chromosomal Phospholipid : Uptake of Benzpyrene by a (Dr. J. Chayen, L. F. La Cour and P. B. Gahan), 652
Chromosome Breakage : Relation of Colchicine to (Douglas Davidson), 1059
Chromosome Number in the Ferret (*Putorius furo*), (O. Lande), 1213
Chromosome Number in the Sugar-Beet Nematode *Heterodera schachtii* Schmidt (Roland H. Mulvey), 1212
Chromosome Numbers in some Members of the Ulotrichales (Y. S. R. K. Sarma), 46
Chromosome Polymorphism in the Common Shrew (Dr. C. E. Ford, J. L. Hamerton and G. B Sharman), 392
Chromosomes of the Potato Root Eelworm (Dr. Ralph Riley and Victor Chapman), 662
Chromosomes (Lampbrush), in Insects (Dr. G. P. Sharma and Ram Parshad), 147
Chromosomes (Polytene), of *Rhynchosciara angelae* : Autoradiography of, at Different Stages of Larval Development (A Ficq and C. Pavan), 983
Chromosomes (Salivary-type), which exhibit 'Puffs' : Incorporation of Phosphorus-32 into (Julian D. Gross), 440
Chronic Fluorosis (Experimental) : A Lipid Material in Bone and Teeth in (Gertrud Lindemann), 926
Chronic Irradiation : Shortening of Life by—the Experimental Facts (R. H. Mole), 456
Chubb, Dr. T. A., and others : Rocket Observation of X-Ray Emission in a Solar Flare, 501
Chupicuaro, Guanajuato, Mexico : Excavations at (Muriel Porter), 636
Churchill, D. M. . A Method for Concentrating Pollen Grains and Small Fossil Remains from Fibrous Peats and Moss Polsters, 1437
Churchman, Dr. A. T. (Barnes, Dr. R. S., and) : Materials for Nuclear Engineering (Structural Effects in Solids of Nuclear-induced Gases), 468
Chymia : Resumption of publication, 170
Ciba Foundation (Study Group) : Discussion on the Behaviour and Fate of Lymphocytes, 1016
Cibula, A. : Wetting and Spreading of Liquid Metals on Solid Metal Surfaces (Alloying between the Liquid and Solid Metal), 1156
Cider Fermentation : Chlorogenic Acid Metabolism in (Dr. G. C. Whiting and J. G Carr), 1479
Ciel : Le, et la Terre (André Danjon, Pierre Pruvost et Jules Blache), *review* by Bernard Pagel, 59
Cigarette Smoke Products (Fresh) : Decrease in Fluorescence Intensity of a Solution of, on Exposure to Light (Hilda Johnston), 1350
Cinematographic Techniques : Electron Microscope Studies on Colloidal Silver Iodine employing (R. W. Horne and Dr. R. H Ottewill), 910
Cipura paludosa, Aubl. : Structural Heterozygosity of (Dr. Arun Kumar Sharma and Miss Chitra Talukdar), 662
Circuit (Eccles-Jordan Flip-Flop) . Analysis of Bistable Multivibrator Operation—the (P. A. Neeteson), *review* by Dr. R. L. Smith-Rose, 401
Circuits (Pulse) . Elements of (Dr. F. J. M. Farley), *review* by Dr. R. L. Smith-Rose, 401
Circuits (Pulse), and Multivibrators, *review* by Dr. R. L. Smith-Rose, 401
Circulation (The Abyssal), of the Ocean (International Union of Geodesy and Geophysics Symposium on), 733
Circulatory Leucocytes *in vitro* (Human) : Survival of—Life-span and Nucleic Acid Turnover (Dr J. Malec and Dr. K. Zakrzewski), 551

Citellus lateralis: Onset and Cessation of Hibernation under Constant Temperature and Light in the Golden-mantled Ground Squirrel (Eric T. Pengelley and Prof. Kenneth C. Fisher), 1371
Citrus Fruits of Assam: Classification of (S. C. Bhattacharya and S. Dutta), 171
Civil Engineering in Trinity College, Dublin, 464
Civil Engineers, Institution of: James Forrest Lecture (Dr. R. v. d. R. Woolley), 420
  Election of Officers for 1957-58, 531
  Lectures on the Conservation of Natural Resources, 687
Civil Service in Great Britain, *review* by R. Brightman, 105
Civil Service or Bureaucracy? (Dr. E. N. Gladden), *review* by R. Brightman, 105
Civil Service Commissioners, H.M.: Report for 1956-57, 371
Civil Service (Home), Fellowships (Commonwealth Fund, New York), 585
Civil Service (Overseas) Fellowships (Commonwealth Fund, New York, 585
Civil Service (Scientific): Promotion of research workers, 638
Civil Services Fellowships: Australian and New Zealand (Commonwealth Fund, New York), 585
Claesson, Prof. S., and others: Effect of Ultra-violet Light on Mouse Skin over a Wide Range of Intensities, 992
Clamped Vertebrate Nerve: Membrane Currents in (José del Castillo, J. Y. Lettvin, W. S. McCulloch and W. Pitts), 1290
Clapham, J. C. R., and Dunn, H. D.: Operational Research (Communications in Collieries), 1088
Clapham, P. A.: *Sarcocystis* sp. in the Red-legged Partridge, *Alectoris rufa*, and the Pheasant, *Phasianus colchicus*, 1294
Clarendon Laboratory, Oxford: Appointment of Dr. D. H. Wilkinson as professor of nuclear physics, 464
Claringbold, P. J., and others: Action of Gonadotrophins on the Ovary, 38
Clark, E. R., and Waddams, J. A.: Interaction between Organic Hydroxy Acids and Silicic and Germanic Acids in Aqueous Solutions, 904
Clark, Dr. G., and others: An Experiment on Air Showers produced by High-Energy Cosmic Rays, 353, 406
Clark, Prof. George L., and Hawley, Gessner G. (edited by): The Encyclopedia of Chemistry, *review* by Prof. J. R. Partington, 569
Clark, R. L.: Appointed supernumerary surveyor, British Solomon Islands Protectorate, 688
Clark, Sir Wilfrid Le Gros: Hominids and 'Humans,' *review*, 156
Clarke, E. C.: Appointed assistant conservator of forests, class I, Cyprus, 413
Clarke, E. K.: Appointed agricultural officer, Nyasaland, 413

Colonial Development and Welfare Acts: Return of Schemes for 1956-1957, 587
Colonial Differentiation between *Escherichia coli* B and *Escherichia coli* B/r (Prof. Leonard N Zimmerman), 1217
Colonial Office: Appointments in the Overseas Service Division, 21, 219, 413, 688, 1098, 1454
  The Colonial Territories (1956-1957), 538
Colonial Products Laboratory: Removal from the Imperial Institute to new premises, and name to be changed to Tropical Products Institute, 1393
Colonial Sugar Refining Company, Ltd: South Pacific Enterprise—the (edited by A. G Lowndes), *review* by Sir Harold Hartley, 1378
Colonial Territories, 1956-1957 (Colonial Office), 538
Colony Forms (Smooth), of some Species of *Pasteurella*: A Protein Antigen associated with (Dr M. J. Crumpton and Dr. D. A. L. Davies), 863
Colorimetric Determination of Vanadium (H. Compaan), 980
Colorimetric Estimation of Manganese (W. V. Single), 250
Colour: Visual Problems of (Symposium at the National Physical Laboratory), 1395
Colour Blind (Totally): Relation of Size of Electroretinogram to Rhodopsin Concentration in Normal Human Beings and one (Dr. V. Elenius and Dr. J Heck), 810
Colour Television: International Symposium on the Physical Problems of (Joint publication by *Optica Acta* and *Acta Electronica* of the Proceedings of the), 953
Colour Vision (Dr. W. S. Stiles), 1395
Colour Vision of Achromats' Parents (Prof. R. W. Pickford), 926
Colour-translating Television Microscope: Ultra-violet (V. K. Zworykin, F. L Hatke and C. Berkley), 71
Colours and Flavours (Nutrition Panel of the Food Group of the Society of Chemical Industry Meetings on Some Nutritional and Allied Problems confronting the Food Manufacturers, I), 1242
Colquhoun, W. P.: Vigilance and the Inspection Problem, 1331
Columbia University: Hormones, Brain Function and Behavior—Proceedings of a Conference on Neuroendocrinology, 1956 (edited by Hudson Hoagland), *review* by Dr. Marthe Vogt, 304
Column Chromatography: A Moving-Paper Collector for (Dr. E A. Bell), 190
Column Packings for Gas Chromatography (Symposium on, organized by the Gas Chromatography Discussion Group under the auspices of the Hydrocarbon Research Group of the Institute of Petroleum), 220
Columns (High-Efficiency), for the Analysis of Hydrocarbons by Gas-Liquid Chromatography (R. P W. Scott and J. D. Cheshire), 702
Combined Light and Velocity Measurements of the Variable Star 12 Lacertae (A. Abrami, G. Bakos, P. Broglia, B. Cester, J. F. Heard, M Hack, M. Huruhata, C. de Jager, J. Kubikowski, J J Kumsishvili, R. Lynds, N L. Magalashvili, S V. Nekrasova, G J. Odgers, J. J. Rutz, J. Sahade, H J Smith, M. J. Smyth, N. Thomas and M. Walker), 1112
Combustion: Seventh International Conference on (Institute of Fuel and the Combustion Institute), 531
Combustion Chamber: Ranque Vortex-Tube (Prof. J. M. F. Vickers), 1271
Combustion Institute (Institute of Fuel and the): Seventh International Symposium on Combustion, 531
Comet Arend-Roland: Polarization of (Dr M. K. Vainu Bappu and Dr. S. D Sinvhal), 1410
  Radio Observations of the (G. R. Whitfield and J. Hogbom), 602
Commemoration of Paul Ehrlich's Genius, *review* by Prof. C. H. Browning, 620
Commercial Use of Atomic Energy: Progress in the, 1096, 1451
Comline, Dr. R. S., and others: Secretion of Progesterone by the Adrenal Gland, 1480
Commissiong, K., and Nicholas, Dr. D. J. D.: Effects of Molybdenum and Copper on some Enzymes in *Neurospora*, 555
Common Sense: Economics and, *review* by Prof. Gilbert Walker, 1441
Common Shrew: Chromosome Polymorphism in the (Dr. C. E. Ford, J. L. Hamerton and G. B. Sharman), 392
Commons, House of: Debate on Administrative Tribunals and Enquiries, 1178
Commonwealth: Forestry in the, 272
  Yearbook of the Universities of the, 1957 (Association of Universities of the British Commonwealth), *review*, 774
Commonwealth Agricultural Bureaux: Election of T. Swaminathan as chairman, 738
Commonwealth Bureau of Dairy Science and Technology: Appointment of E. J. Mann as director, 893
Commonwealth Bursaries (Royal Society and Nuffield Foundation Awards), 119
Commonwealth Fellowship in Chemistry: Corday—Morgan (Chemical Society), 585
Commonwealth Industrial Conference, *review* by Dr. W. H. Scott, 876
Commonwealth Relations Office: Dr. William Ralston seconded from the Royal Military College of Science, Shrivenham, as scientific and technical adviser, with special responsibility for the scientific problems of the Colombo Plan, 172
Commonwealth Scientific and Industrial Research Organization: Eighth Annual Report (1955-1956), 962
Commonwealth (British), Association of Universities of the: Yearbook of the Universities of the Commonwealth, 1957, *review*, 774
Commonwealth (British) Scientific Office in Washington: Appointment of E. S. Hiscocks as director of the United Kingdom Scientific Mission, 220
Commonwealth Fund, New York: Fellowships for Study and Travel in the United States, 585
Commonwealth and Empire: H.R.H. the Duke of Edinburgh's Study Conference on the Human Problems of Industrial Communities within the (Oxford, 1956), *review* by Dr. W. H. Scott, 876
Communication: On Human (Dr Colin Cherry), *review* by J. T. Allanson and Prof. Alan S C. Ross, 255
  Information and, 735
Communication Engineering (Dr. W. L. Everitt and Prof. G. E. Anner), third edition, *review* by Prof. James Greig, 1080
Communication Theory, *review* by J. T. Allanson and Prof. Alan S. C. Ross, 255
Communication of Knowledge: New Methods and Techniques for the (Dr. H. Coblans), 735
Community of Penguins, *review* by Dr. L. Harrison Matthews, 3
Compaan, H.: Colorimetric Determination of Vanadium, 980
Company Executive Development Schemes: A Survey in North-West England made by the British Institute of Management and the Manchester College of Technology, 153
Comparative Psychology: Ethology and (Conference at the Centre for Advanced Study in the Behavioral Sciences, Stanford, California), 362
  Instinct in Man in the Light of Recent Work in (Dr. Ronald Fletcher), *review* by Prof. J. Drever, 1257
Comparator (A Frequency), using Electron and Proton Resonance in a Common Magnetic Field (O. Nourse), 192
Comparison of Caesium Resonators by Transatlantic Radio Transmission (Dr. L. Essen and J. V. L. Parry, and J A. Pierce), 526
Comparison (A Quantitative), of Sulphydryl Content and Formazan in the Tissues of the Pea Radicle (B. Jámbor, M. Dévay and Dr. L. W. Roberts), 997
'Compensatory Hyper-regeneration' in the Antennae of Hemiptera (Prof. Alexander Wolsky), 1144
Competition: Interspecific (Charles Elton), 1002
Competition (Interspecific): An Elementary Theory of (M. H. Williamson), 422
Complexes: Organo-Clay (Dr. W. W. Emerson), 48
Complexing Agents (Chelating or): Formation of Liesegang-like Rings by Metal Ions and (Prof. Robert E. Feeney and Nelle Bennett), 979
Complexity of the Vanadium—Hydrogen Peroxide System (Dr. G. Kakabadse and H. J. Wilson), 861
Components of the Catch Curve of *Culex annulus* in Singapore (Donald H. Colless), 1496
Comportement des Animaux et de l'Homme: l'Instinct dans le (M. Autuori, M.-P. Bénassy, J. Benoit, R. Courrier, Ed.-Ph. Deleurance, M. Fontaine, K. von Frisch, R. Gesell, P.-P. Grassé, J. B. S. Haldane, Mrs. Haldane-Spurway, H. Hediger, M. Klein, O. Koehler, D. Lehrman, K. Lorenz, D. Morris, H Piéron, C.-P. Richter, R. Ruyer, T.-C. Schneirla et G. Viaud), *review* by Dr. P. T. Haskell, 518
Composition of the Cell Wall of *Lactobacillus bifidus* (C. S Cummins, Miss Olive M. Glendenning and Dr. H. Harris), 337
Composition of Muscle in Malnourished Human Infants (Dr. J. C. Waterlow and C B. Mendes), 1361
Compost (Mushroom): *Heleococcum aurantiacum*, an Uncommon Weed Fungus of (F. C. Wood), 283
Compound (A New), of Univalent Cobalt (Dr A. A. Vlček), 753
Compound (Stable Phosphorus): Accumulation of a, in Glycolysing Insect Muscle (Václav Kubišta), 549
Compound Polarizer: The (Prof. M A MacConaill), 603
Compounds: Additional Purine, in the Venom of the Tiger Snake (*Notechis scutatus*), (Hazel M. Doery), 799
  Heterocyclic (edited by Robert C. Elderfield), Vol. 5, Five-Membered Heterocycles containing Two Hetero Atoms and their Benzo Derivatives, *review* by Prof. R. A. Raphael, 352
  Radioactive Carbon, 636
Compounds containing Carbon Isotopes: Bibliography for 1953 and 1954 of Syntheses of (J. C Nevenzel, D. R. Howton, R. F. Riley and G. Steinberg), 636
Compounds (Aromatic Nitro): Group Localization Energy and Polarographic Half-Wave Potentials of (Dr. Sadhan Basu and Jayanti Nag Chaudhuri), 1473
Compounds (Catechol), in Rat Tissues and in Brains of Different Animals (Dr. K. A. Montagu), 244
Compounds (Coordination): The Chemistry of the (edited by John C. Bailar, Jr), *review* by Dr. R. J Magee, 725

Compounds (Copper) : Timber Preservation by (D. S. Belford and Prof. R. D. Preston, and C. D. Cook and E H. Nevard), 1081
Compounds (Haem) : Photosensitivity of (Prof. Q. H. Gibson and S. Ainsworth), 1416
Compounds (Phosphorus) : Fractionation of, in Ossifying Cartilage (R. G. Whitehead and Dr S. M. Weidman), 1196
Compounds (Sulphonylureas and related) : The Effects of the, in Experimental and Clinical Diabetes (New York Academy of Sciences Conference on), 584
Compounds (Terpenoid) Recent Advances in the Chemistry of (Chemical Society Symposium on), 470
Compressional Waves : Velocity of, for a Stratigraphic Profile of Chalk at Flamborough, Yorkshire (A. S. Laughton and A. H. Stride), 977
Compressor (Cell), for the Measurement of Mass and Concentration by Interference Microscopy (Dr R. J Goldacre, Dr. D. M. Easty and Dr. E. J. Ambrose), 1487
Compton, Dr. Arthur H. · Nuclear Energy and the Growth of Man, 1157
Compton Gold Medal of the American Institute of Physics conferred on Dr G B Pegram, 836
Computer Society, British : Election of Dr. M. V. Wilkes as first president, 637
  First Meeting, 953
  Inauguration of the Glasgow Branch, 1097
Computers, *review* by Dr. A. D. Booth, 1009
Computers (Automatic Digital) · An Introduction to (R. K. Livesley), *review* by Dr. A. D. Booth, 1009
Computers (Electronic Digital) · The Management Approach to (J. Sandford Smith), *review* by Dr. A. D. Booth, 823
Concentrating Pollen Grains and Small Fossil Remains from Fibrous Peats and Moss Polsters · A Method for (D. M Churchill), 1437
Concentration : A Cell Compressor for the Measurement of Mass and, by Interference Microscopy (Dr. R. J Goldacre, Dr. D. M. Easty and Dr E J. Ambrose), 1487
Concentration of Anionic Surface-active Agents and the Electrophoretic Mobility and Viability of *Aerobacter aerogenes* : Relationship between the (Dr. D. E E. Loveday and Dr. A. M. James), 1121
Concentration and Jelly-forming Capacity of the Pectin Present : Relationship of the Strength of High Solids Pectin Gels to the (Dr Peter Wade), 1067
Concentration Gradients : Transport of Potassium-42 and Rubidium-86 by Kidney Cortex Slices—the Effect of varied (A. Kleinzeller and Dr. J. H. Cort), 1124
Concentration-gradients (Solution) : A Simple Device for Forming (Donald F. Weckaufer), 1122
Conception : Awards for laboratory or clinical work on the Control of (Oliver Bird Trust), 737
Condensed Tannins : Some Recent Advances in the Identification of Leuco-Anthycyanins and the Chemistry of (Dr. David G. Roux), 973
Confidence (Public), and Scientific Development, 1439
Congenital Porphyria in Bovines—First Living Cases in Britain (Prof. E. C. Amoroso, R M. Loosmore, Prof. C. Rimington and B. E. Tooth), 230
Congenital, Non-obstructive, Non-haemolytic Jaundice : A Biochemical Lesion in (Dr Julius Axelrod, Dr. Rudi Schmid and Lydia Hammaker), 1426
Congo Belge : Distribution conjointe de la température et de l'humidité de l'air au (Dr. F. Bultot), 219
Conical Paper Chromatography (Dr. Yoshinobu Osawa), 705
Conifer Embryology : Aspects and Problems of (Prof. J. Doyle), 485
Conjugates (Fluorescein *iso*Cyanate-Globulin) : Rapid Extraction with Ethyl Acetate of Free Fluorescein Derivatives from (Dr. J K. Dineen and G. L. Ada), 1284
Connes, J : Interference Spectroscopy, 956
Connes, P. : Interference Spectroscopy, 956
Connor, T. M. (Reid, Prof. C., and) : Delocalization in Hydrogen Bonds, 1192
Conquest of Materials : Chemistry, the (Kenneth Hutton), *review* by G. Fowles, 352
Consden, Dr. R. Chromatography—Theory and Practice, *review*, 773
Conservation of Natural Resources (Lectures at the Institution of Civil Engineers), 687
Conservation of Nature and Natural Resources, International Union for the : Proceedings of the sixth Technical Meeting, 584
Constant Beam-Width . Arrays with, over a Wide Frequency-Range (Prof. D. G. Tucker), 496
Constant Temperature and Light · Onset and Cessation of Hibernation under, in the Golden-mantled Ground Squirrel (*Citellus lateralis*), (Eric T Pengelley and Prof. Kenneth C. Fisher), 1371
Constants of Physics : Secular Changes of the Units and (A H. Cook), 1194
Constants (Elastic), of Hardened 1 per cent Carbon Steels on Tempering : Variation of (A F. C. Brown, A. G. Cole and M. F. Markham), 1254
Constitution and Care of the Infant Animal (Dr. E. M. Widdowson), 681
Constitutional Diagrams of Alloys (originally compiled by Dr J L Haughton), second edition compiled by A. Prince, *review* by A R Bailey, 352
Consultants Bureau, Inc. : Russian—English Glossary of Nuclear Physics and Engineering, *review* by J. B. Sykes, 569
Consumption of Alcohol by Rats : An Unsuspected Factor which influences (R. J G. Gillespie and Prof. C. C. Lucas), 1292
Consumption and Expenditure : Domestic Food (1955)—Annual Report of the National Food Survey Committee (Ministry of Agriculture, Fisheries and Food), 587
Consumption and Refinery Production, 1955 and 1956 : United Kingdom Petroleum Industry Statistics relating to (Petroleum Information Bureau), 361
Contact with Rusting Iron : Degradation of Cellulosic Fibres in (W. A. Bell and Jean M. Gibson), 1065
Contact Angles · Use of the Term 'Young's Equation' for (Prof. N. K. Adam), 809
Contamination of Stock Lines of Human Carcinoma Cells by Pleuropneumonia-like Organisms (Dr. L. H. Collier), 757
Continent (Arctic) . Elephant Seals on the (Susan E. Ingham), 1215
Continental Cycles of the Pleistocene Period in Morocco : Correlation between the Marine and (Georges Choubert), 1171
Contraction of Smooth Muscle by Drugs : Mechanism of (Dr D. H. L. Evans and Dr. H. O. Schild), 341
Contrasted Planes of Nutrition : Effect of, on the Carcass Composition of the East African Dwarf Goat (Dr. P. N. Wilson), 145
Control · Information and, No. 1, 1097
Control : Dairy Plant, *review* by Dr. L. F. L. Clegg, 207
  Production (Industrial Applications Section of the Royal Statistical Society Conference on), 1239
Control of Administrative Tribunals, 1178
Control of Chemical Additives in Food (Food Law Institute of the United States, the Food Group of the Society of Chemical Industry, the Society for Analytical Chemistry and the Association of Public Analysts of Great Britain Joint Discussion on), 692
Control of Conception : Awards for laboratory or clinical work on the (Oliver Bird Trust), 737
Control of Flowering in Rice by Plant-Growth Substances (Dr. G. Misra and G. Sahu), 816
Control of the Humoral Factors of the Zona Glomerulosa of the Adrenal Cortex (A Nagy, A. Olah and Prof. S. Karady), 1481
Control of Public Expenditure on Scientific Projects, 695
Control of Virus Diseases : Use of Insecticides for the (Association of Applied Biologists Symposium on), 1454
Control of Witchweed, *Striga hermonthica* Benth., in the Sudan Gezira (S. A. J. Tarr), 1143
Control (Attempted), of Ectromelia in a Mouse-breeding Colony (A. E. G. Pearson), 1300
Control (Fertility) : Fertility and, 1027
Control (Laboratory), of Dairy Plant (Dr. J. G. Davis), *review* by Dr. L. F. L. Clegg, 207
Control (Quality), of Food (Association of Public Analysts of Great Britain and the Food Group of the Society of Chemical Industry Joint Discussion on), 1326
Controlled Thermonuclear Reactions · ZETA Apparatus for (Atomic Energy Research Establishment), 1097, 1451
Controversy : The Golgi (Prof. Vishwa Nath), 967
Convection in Rotating Fluids . Planetary Atmospheres and (Royal Meteorological Society and the Royal Astronomical Society Joint Symposium on), 1455
Convergatron : The (Dr. Lyle B. Borst), 1096
Conversion of Fat to Carbohydrate in Castor Beans : A Mechanism of (H. L Kornberg and H. Beevers), 35
Conversion of Glycogen to Sorbitol and Glycerol in the Diapause Egg of the *Bombyx* Silkworm (Haruo Chino), 606
Conversion of Pyruvic Acid to Alanine in the Silkworm Larva (T. Fukuda), 245
Conway, Prof E. J · Electrolyte Physiology, 1017
  Biology of Yeast (Cell Structure and Function in Yeast), 1161
Cook, A. H. : Secular Changes of the Units and Constants of Physics, 1194
Cook, A. S. : Appointed temporary industrial chemist, Eastern Nigeria, 688
Cook, G. D , and Nevard, E. H., and others : Timber Preservation by Copper Compounds, 1081
Cook, E. R , and Luscombe, M. : A Non-Destructive Technique for Locating Amino-acids, 708
Cook, F. D., and others .. Lack of Growth-promoting Activity of Inactivated Penicillin with Turkey Poults, 923
Cook, Dr G. B. · Initiation and Growth of Explosion in Solids (Thermal Explosion Theory), 73
Cook, Dr. J. W Chemical Approaches to the Investigation of Lung Cancer (Presidential Address to Section B (Chemistry), of the British Association for the Advancement of Science), 479
  Biogenesis of Natural Products, 679
  Apartheid, 686
  University Apartheid in South Africa, 1164
Cook, L M : Awarded a Nature Conservancy Research Studentship for Postgraduate Training in Ecology (Zoology), 467
Cook, Prof M A · Initiation and Growth of Explosion in Solids (Growth of Explosion), 74
Cook, W. H : Research in the Biosciences, a Mid-Century Perspective, 267
Cooke, Dr A. H. . Low-Temperature Physics (Antiferromagnetism in some Iridium Compounds), 462
Cooke, Mrs. Alice Sophia *Obituary* by Dr. P. K. C. Austwick, 411
Cookson, Prof R C., and Trevett, M E. : Recent Advances in the Chemistry of Terpenoid Compounds (Delpheline), 471
Coombe, Prof D. S. : *Obituary* of Prof W. N Benson, 1023
Cooper, B. S. (Rawson-Bottom, W. E., and) · Natural and Artificial Lighting in Museums, 1323
Cooper, Dr. G. A. : Chazyan and related Brachiopods, *review* by Prof. Alwyn Williams, 401
Cooper, L. H. N. · The Abyssal Circulation of the Ocean, 733
Cooper, L. H. N. (Shaw, T. I., and) : State of Iodine in Sea Water, 250

Cuticle of the Desert Locust : Sclerotization and Melanization—Two Independent Processes in the (Dr. S. R. A. Malek), 237
Cuticle (Insect) : Non-specific Hydroxylation of Aromatic Amino-Acids by an (Prof. R. Dennell), 1070
Cuticles (Arthropod) : Action of Diphenol on (J. Kennaugh), 238
Cutler, D. (Powles, Dr. J. G., and) : Audiofrequency Nuclear-resonance Echoes, 1344
Cutting, Dr. C. L. : Quality Control of Food (System of Grading Kippers), 1327
Cybernetics in Industry : Operational Research and (Lectures arranged by the Department of Operational Research and Cybernetics of the United Steel Companies, Ltd., in co-operation with the Sheffield College of Commerce and Technology), 72, 531
Cycles : Nuclear Fuel (Institute of Physics Conference on), 1239
Cyclic Stress : Grain-Growth in Metals by (Prof. H. Okubo and N. Nozaki), 604
Cyclohexane 1,2-*Trans* Diamine Tetraacetic Acid and Diethylenetriamine Pentaacetic Acid : Excretion of Yttrium and Lanthanum Chelates of, in Man (Dr. Harry Kroll, Dr. Samuel Korman, Dr. Elsie Siegel, Dr. Hiram E. Hart, Dr. Betty Rosoff, Dr. Herta Spencer and Dr. Daniel Laszlo), 919
Cyclotron Frequency (Ion) : Discharges in Hydrogen at the (Dr. A. W. Bright and K. Ramanathan), 1468
Cyclotron Resonance : Ion (Dr. R. F. Saxe), 87
Cylinder Functions (Parabolic) : Tables of Weber (edited by Dr. J. C. P. Miller), *review* by Dr. C. W. Jones, 400
Cylinders (Bonded), of Soft Vulcanized Rubber subjected to Tensile Loads : Internal Flaws in (A. N. Gent and P. B. Lindley), 912
Cypraea : The Genus (Alison Kay), 1436
Cysts (Multiple) : Development of, and of Haemorrhagic Affections of Internal Organs in Albino Rats treated during the Embryonic or New-born Period with Rous Sarcoma Virus (G. J. Svet-Moldavsky), 1299
Cytochemical Localization of Acid Phosphatase in *Trichonympha turkestanica* Bernstein (Trichonymphina, Trichonymphidae), (M. M. El Mofty), 1367
Cytochrome *h* : Properties of Helicorubin and (Dr. Joan Keilin), 427
Cytochrome Composition of some Strains of *Streptomyces* (Allen H. Heim, Dr. Warren S. Silver and Yehudith Birk), 608
Cytology of Indian Species of *Onychium* (P. N. Mehra and S. C. Verma), 715
Cytology of Linseed Autotetraploids : Morphology and (K. K. Pandey), 269
Cyvin, S. J. (Bastiansen, Prof. O., and) : Molecular Vibrations and Standard Deviation of Interatomic Distances in Benzene, 980
Czechoslovak Academy of Sciences : *Acta Virologica*, Vol. 1, No. 1, 1170

DAAMS, J., and others : New *s*-Triazine Herbicides, 147
Dadey, H. (Greenham, C. G., and) : Electrical Determination of Cold Hardiness in *Trifolium repens* L. and *Medicago sativa* L., 541
Dadswell, H. E., and others : Fundamental Aspects of Fibres and their Treatment for Papermaking (Chemistry of Pulp Fibres—Reaction Wood), 1176
Dagliesh, A. R. F. : Awarded the Polar Medal, 18
Dagliesh, Lieut.-Comdr. D. G. : Awarded a Clasp to the Polar Medal, 18
Dairy Plant : Laboratory Control of (Dr. J. G. Davis), *review* by Dr. L. F. L. Clegg, 207
Dairy Plant Control, *review* by Dr. L. F. L. Clegg, 207
Dairy Science and Technology, Commonwealth Bureau of : Appointment of E. J. Mann as director, 893
Dairying, National Institute for Research in : Report for 1956, 965
Daisley, K. W. : Vitamin B_{12} in Marine Ecology, 1042
Dale, Sir Henry : *Obituary* of Prof. Marinus Van den Ende, 168
Dales, R. Phillips : Research in Marine Biology (Feeding of Serpulid and Sabellid Fan-worms), 746
Dalhousie University : Post-doctorate Fellowship in Physics, 1325
Dalton Exhibition of the Royal Institute of Chemistry (Coal and Coal Chemicals in the National Economy), 637
Dalton Lecture of the Royal Institute of Chemistry (Dr. J. Bronowski), 636
Daly, Dr. I. de Burgh : Retirement from the directorship of the Agricultural Research Council Institute of Animal Physiology, 787
Damage (Intestinal), by Radiation and its Chemical Modification (R. H. Mole and Diana M. Temple), 1278
Damage (Local Tissue), in Histamine-depleted Rats : Radiation Lethality and (H. A. S. van den Brenk), 1467
Damaged Starch in the Evaluation of Wheat Quality : Role of (L. H. Bird), 815
Danielli, Roy : Our Debt to the Future (Human Values and the Evolution of Society), 260
Daniels, Prof. Farrington, and others : Experimental Physical Chemistry, fifth edition, *review* by Dr. E. F. G. Herington, 209
Daniels, Dr. H. E. : Appointed to the chair of statistics in the University of Birmingham, 119 ; work of, 119
Daniels, T. C. : Rheology of Disperse Systems (Fall of Metal Spheres through Fluidized Beds of Sand, Ilmenite and similar Powders), 959
Danish Deep-Sea Expedition round the World, 1950-52 : Scientific Results, Vol. 2, 687
Danishefsky, Prof. Isidore (Eiber, Prof. Harold B., and) : Clearance of Injected Heparin from the Blood, 1359
Danjon, Prof. André : Stratton's *Festschrift*, *review*, 1308
Danjon, Prof. André, et autres : Le Ciel et la Terre, *review* by Bernard Pagel, 59
Dannatt, Prof. C. W. : Title of professor emeritus in the University of London conferred on, 220
Danusso, Prof. F. : Macromolecular Chemistry (Kinetics of Stereospecific Polymerization), 842
Dao-lee, Dr. Tsung (Ning-yang, Dr. Chen, and) : Awarded jointly the Nobel Prize for 1957 for Physics, 951 ; work of, 951
Darby, Prof. H. C. : English Place-Names, *review*, 106
Darbyshire, J., and Ishiguro, S. : Tsunamis, 150
D'Arcy, —. : The Infant Animal (Feeding Freshly Harvested Barley or Rye to Pigs), 682
Dark, F. A., and Strange, R. E. : Bacterial Protoplasts from *Bacillus* Species by the Action of Autolytic Enzymes, 759
Darlow, H. M., and Powell, E. O. : An Effect of Hexylresorcinol on Bacterial Aerosols, 1425
Dart, Prof. Raymond A. : The Osteodontokeratic Culture of *Australopithecus prometheus*, *review* by Sir Wilfrid Le Gros Clark, 156
Dartnall, Dr. H. J. A. : The Visual Pigments, *review* by Dr. Ruth Hubbard, 1258
  Visual Problems of Colour (Bleaching Kinetics of the Visual Pigments of Four Species of Fish), 1396

Denoon, T. M.: Appointed temporary livestock superintendent, Department of Veterinary Research, Federation of Nigeria, 1098
Densham, A. B.: Modern Analytical Chemistry in Industry (Physical Methods of Analysis used by the Gas Industry—Absorption, Emission and Fluorescent Spectroscopy), 367
Densitometry (Photographic), with the Two—Wave-length Method (Dr. Mortimer L. Mendelsohn), 1408

Density of Water adsorbed on Wyoming Bentonite (Duwayne M. Anderson and Prof. Philip F. Low), 1194

Density-governing Reaction in *Sminthurus viridis* (L.) : Field Evidence of (M. M. H. Wallace), 388

Dental Characteristics of an Eskimoid People : The Aleut Dentition—a Correlative Study of (Dr. Coenraad F. A. Moorrees), *review* by F. Taylor Monks, 1380

Dental Enamel : Assessment of Mineral Content in Water-mounted Sections of (J. H. Allan), 1130

Dental Enamel (Powdered) : Fluoride Removal by, from Solutions of Stannous or of Sodium Fluoride (Dr. Frank A. Smith, Dwight E. Gardner, Dr. Samuel E. Leach and Dr. Harold C. Hodge), 1421

Dental Pulp Vessels (Human) : X-Ray Microscopy of (Prof. R. L. de C. H. Saunders), 1353

Dentition : The Aleut—a Correlative Study of Dental Characteristics of an Eskimoid People (Dr. Coenraad F. A. Moorrees), *review* by F. Taylor Monks, 1380

Denton, E. J. : Visual Problems of Colour (Situation of the Products of Bleaching of Visual Pigments), 1396

Deoxypentose Nucleic Acid : Protoplasts of *Escherichia coli* as Sources and Acceptors of—Rehabilitation of a Deficient Mutant (Prof. Erwin Chargaff, Herbert M. Schulman and Dr. Herman S. Shapiro), 851

Deoxypolynucleotides (Soluble), released in Mouse Spleen by X-Irradiation : Chromatographic Characterization of (Dr. R. K. Main, L. J. Cole and M. E. Ellis), 1285

Deoxyribonucleic Acid : Anion Exchange Chromatography and Molecular Size of (Morton Rosoff, Giampiero di Mayorca and Aaron Bendich), 1355

Lack of Differential Radiation Effect on the Incorporation of Labelled Precursors into (L. G. Lajtha), 1048

Molecular Weights and Physical Properties of (Prof. J. A. V. Butler, D. J. R. Laurence, A. B. Robins and Dr. K. V. Shooter), 1340

A Phenol-extracted Bacterial (Prof. Werner Braun, Jeanne W. Burrous and John H. Phillips, jun.), 1356

Deoxyribonucleic Acid in Bone Marrow, Spleen and Liver of Rats : Influence of Post-Irradiation Administration of Methionine on the Levels of (M. K. Narurkar, A. J. Baxi, N. S. Ranadive, M. V. Narurkar and M. B. Sahasrabudhe), 193

Deoxyribonucleic Acid Changes in Bacteria : Visual Observation of, during Growth of Bacteriophage (Fluorescence Microscopy in the Study of Nucleic Acids), (Dr. E. S. Anderson), 1336

Deoxyribonucleic Acid Content of the Nucleus of Liver Cells after Partial Hepatectomy (R. Laquerrière), 1199

Dependence of Heat Capacity of certain Crystals on their Thermal History (R. G. S. Morfee and L. A. K. Staveley), 1246

Dependence on Oxygen and Temperature of the Sensitivity of Broad Bean Roots to γ-Radiation (G. J. Neary), 248

Deposition of Phosphate in the Bones of Growing Diabetic Rats : Action of Glucose-1-Phosphate on the (Dr. N. Siliprandi, G. De Bastiani, F. Petrelli and B. Fischetti), 1357

Deposition (Vacuum), of Metals (Department of Physics of the University of Cambridge and the British Scientific Instrument Research Association Meeting on), 124

Deposition Plant (Vacuum) : X-Ray Radiation Hazard using (L. Holland), 89

Depp, E. A., and Neuworth, M. B. : At the Second International Conference on Coal Science (Pyrolysis of Model Compounds thought to embody the type of Chemical Structure that exists in Coals), 419

Depth of the Earth : Solar Energy and the (N. V. Belov and V. I. Lebedev), 1324

Depths of Habitat of Marine Fishes : Visual Pigments and (Prof. George Wald, Paul K. Brown and Patricia Smith Brown), 969

Derivative Spectra : Difference and (Dr. A. E. Martin), 231

Des Voeux Memorial Lecture of the Smoke Abatement Society (Sir Graham Sutton), 637

Desert Locust : An Albino Strain of the (Philip Hunter-Jones), 236

Sclerotization and Melanization—Two Independent Processes in the Cuticle of the (Dr. S. R. A. Malek), 237

Desiccation : Effect of, on the Eggs of *Simulium damnosum*, Theobald (Dr. R. C. Muirhead-Thomson), 1432

Design of Physics Research Laboratories (London and Home Counties Branch of the Institute of Physics Symposium on), 838

Design (Mechanical), for Electronics Production (John M. Carroll), *review* by D. L. Johnston, 1154

Designs for Europe (Political and Economic Planning, Broadsheet No. 414), 965

Desnuelle, P. : Protein Structure and Biological Activity, 834

Destruction (Mass) : Hazards associated with the Development of Weapons of—International Meeting of Scientists, 358

Desty, D. H. : Vapour Detectors for Gas Chromatography, 22

Detached Wheat Leaves : Effect of Benzimidazole on (Dr. Clayton Person, Dr. D. J. Samborski and Dr. F. R. Forsyth), 1294

Detecting Diseases in Wood : A Non-Destructive Method of (J. S. Ward and M. J. Woodman), 47

Detection of Inhomogeneities in Transparent Plastic Sheet by a simple Schlieren Technique (H. H. Allen), 50

Detection of Oil Adulteration by Differential Infra-red Spectroscopy : Identification of Edible Oils and the (J. C. Bartlet), 1071

Detection of Particles inside Potential Barriers (Rolf G. Winter), 1471

Detection of the Substrate of Enzymic-Browning in Cacao by a Post-chromatographic Enzymatic Technique (Dr. L. A. Griffiths), 1373

Detection (Autoradiographic), of Sulphone in the Affected Tissues of Leprosy Patients (R. K. Poddar and Dr. K. R. Chatterjee), 854

Detector (A Hydrogen-Conversion), for Gas Chromatography (G. E. Green), 295

Detectors (Vapour), for Gas Chromatography (Gas Chromatography Discussion Group of the Institute of Petroleum Symposium on), 22

Determination of Auroral Height by Radar (R. S. Unwin and Dr. M. Gadsden), 1469

Determination of Chlorogenic Acid (Dr. A. S. Weaving), 1287

Determination of Local Electrode Potentials : Study of Strain Distribution in Metals by the (Prof. Hugh O'Neill and Dr. D. Eurof Davies), 498

Determination of Low Pressures of the Virial Coefficients of Vapours : A Significant Error in the (Prof. R. Whytlaw-Gray and Dr. G. A. Bottomley), 1252

Determination of Papaverine and Narcotine by using Ammonium Reineckate (Dr. Lee Kum Tatt and Dr. Charles G. Farmilo), 1288

Determination of Radon and Thoron in Air (G. B. Courtier), 382

Determination of the Sex of Human Abortions by Nuclear Sexing the Cells of the Chorionic Villi (Prof. A. C. Stevenson and R. H. McClarin), 198

Determination (Colorimetric), of Vanadium (H. Compaan), 980

Determination (Direct Structure), by Optical-Transform Methods (M. M. Crowder, K. A. Morley and Dr. C. A. Taylor), 431

Determination (Electrical), of Cold Hardiness in *Trifolium repens* L. and *Medicago sativa* L. (C. G. Greenham and H. Daday), 541

Determination (Precision), of Cell Dimensions by the Back-Reflexion Weissenberg Method (F. H. Herbstein), 291

Determining Ultrasonic Velocities in Rocks : A Simple Method of (K. Subbarao and Dr. B. Ramachandra Rao), 978

Detonation Waves (Gaseous) : Effect of Tube Diameter on the Pressures in (Dr. D. H. Edwards and G. T. Williams), 1117

Deuteride (Gallium) : Band Spectrum of Gallium Hydride and (H. Neuhaus), 433

Dévay, M., and others : A Quantitative Comparison of Sulphydryl Content and Formazan in the Tissues of the Pea Radicle, 997

Developing Nerve Fibres : Transmission of Trophic Stimuli along (Dr. Arthur Hughes and Pierre André Tschumi), 999

Development : Amenities, Rights of the Individual and the Needs of, 819

Education for (Sir Sydney Caine), 1099

Research and, in Nuclear Energy, 397

Development of Beet Eelworm, *Heterodera schachtii* Schmidt, in the Wild Beet, *Beta patellaris* (Audrey M. Shepherd), 341

Development of Chemical Thermoregulation in Piglets (Dr. A. Holub, Z. Forman and D. Jezková), 858

Development of Industrial Chemistry, *review* by Prof. John Read, 723

Development of Isolated Female Larvae of the Potato-Root Eelworm (*Heterodera rostochiensis* Woll.), (T. D. Williams), 1000

Development of Multiple Cysts and of Haemorrhagic Affections of Internal Organs in Albino Rats treated during the Embryonic or New-born Period with Rous Sarcoma Virus (G. J. Svet-Moldavsky), 1199

Development of *Sclerotium rolfsii* (Sacc.) : A Physiological Effect of Triethanolamine on the (S. Lavee), 1494

Development of Weapons of Mass Destruction : Hazards associated with the—International Meeting of Scientists, 358

Development (Aeronautical Research and), Advisory Group for : Seventh General Assembly, 737

Development (Atomic Power), in India : Economics of, and the Indian Atomic Energy Programme (Dr. H. J. Bhabha), 1382

Development (Human) : The Direction of (Prof. M. F. Ashley Montagu), *review* by Prof. T. S. Simey, 157

Development (Scientific) : Capital for (Royal Society of Arts Conference on), 307

Public Confidence and, 1439

Development (Scientific), and Human Relations : Trades Unions, (Lewis T. Wright), 1013

Developments in Industrial Low Temperature Gas Separation : Recent (Low Temperature Group of the Physical Society and the Institution of Chemical Engineers Conference on), 270, 1028

Developments in Liquid-Fuel Firing (1948-1959) : Major (Institute of Fuel Residential Conference on), 531

Developments (Atomic Energy) : Collaboration between Britain and Norway in, 361

Responsibility for, 1097

Developments (Economic), in the Middle East (1955-56), 785

Deviation (Standard), of Interatomic Distances in Benzene : Molecular Vibrations and (Prof. O. Bastiansen and S. J. Cyvin), 980

Device (A Simple), for Forming Solution Concentration-gradients (Donald B. Wetlaufer), 1122

Devonshire, Dr. A. F. : Thermodynamics and the Structure of Matter, *review*, 724

Dew (Dr. J. L. Monteith), 1400

Dewar, R. J. : Appointed deputy chief conservator of forests, Nyasaland, 1098

Dewhirst, Dr. D. W., and others : Solar Granulation and its Observation from a Free Balloon, 211

Dey, P. K., and others : Kopsine and Strychnine—a Comparative Study of their Physiological Properties, 916

Diabetes (Alloxan), in the Piglet (Dr. L. E. Mount), 344

Diabetes (Experimental and Clinical) : The Effects of the Sulphonylureas and related Compounds in (New York Academy of Sciences Conference on), 584

Diabetic Rats (Growing) : Action of Glucose-1-Phosphate on the Deposition of Phosphate in the Bones of (Dr. N. Siliprandi, G. De Bastiani, F. Petrelli and B. Fischetti), 1357

Dialogue on the Great World Systems (Galileo Galilei), in the translation of T. Salusbury (edited, corrected, annotated and provided with a Historical Introduction by Prof. Giorgio de Santillana), *review* by Prof. E. J. Dijksterhuis, 450

Diameter (Tube) : Effect of, on the Pressures in Gaseous Detonation Waves (Dr. D. H. Edwards and G. T. Williams), 1117

Diamine Tetraacetic Acid (Cyclohexane 1,2-*Trans*), and Diethylenetriamine Pentaacetic Acid : Excretion of Yttrium and Lanthanum Chelates of, in Man (Dr. Harry Kroll, Dr. Samuel Korman, Dr. Elsie Siegel, Dr. Hiram E. Hart, Dr. Betty Rosoff, Dr. Herta Spencer and Dr. Daniel Laszlo), 919

Diamond, Prof. J. : Appointed to the Advisory Council of the Royal Military College of Science, Shrivenham, 1026

Diamonds : A Surface Electroluminescence Effect in (Dr. H. F. Logie and R. R. Urlau), 1254

Diapause Egg of the *Bombyx* Silkworm : Conversion of Glycogen to Sorbitol and Glycerol in the (Haruo Chino), 606

Diphenol : Action of, on Arthropod Cuticles (J. Kennaugh), 238

3 4-9:10-Dibenzopyrene : Isolation of, from Coal-Tar (Dr. R. Schoental), 606

Dibromide (Ethylene) : Action of, on Hen Gonadotrophic Hormones (Dr. Eugenia Olomucki), 1358

2,4-Dichlorophenoxyacetate : Relation of Structure of, to its Mode of Action as an Auxin (Emmett J. Johnson and Prof. Arthur R. Colmer), 1365

Dick, M. I. B., and others : An Investigation of an Action of Penicillin, 657

Dicks, M., and others : Reaction of Globin with Haemin in Interfacial Films, 437

Dictionary of Microbiology (Morris B. Jacobs, Maurice J. Gerstein and Prof. William G. Walter), *review* by Dr. E. F. Gale, 209
Dictionary of Statistical Terms (Prof. Maurice G. Kendall and Dr. William R. Buckland), *review* by W. Brass, 518
Dictionary (International), of Physics and Electronics, *review* by Dr. J. R. Tillman, 55
Die-back of Cacao Seedlings in Nigeria caused by a Species of *Phytophthora* (S. R. Chant), 1494
Diego Blood Group in Negro (Dr. P. C. Junqueira and P. J. Wishart), 341
Diehl, P., and Ogg, Jun., R. A. : Nuclear Magnetic Resonance Studies of Boron Trifluoride Complex Formation, 1114
Dieldrin Deposits on Sorptive Mud Surface : Improved Persistence of (Ph. Gerolt), 394
Dietary Fats (Different) : Effect of, on the Faecal End-Products of Cholesterol Metabolism (H. Gordon, B. Lewis, L. Eales and Prof. J. F. Brock), 923
Diethylenetriamine Pentaacetic Acid : Excretion of Yttrium and Lanthanum Chelates of *Cyclohexane* 1,2-*Trans* Diamine Tetraacetic Acid and, in Man (Dr. Harry Kroll, Dr. Samuel Korman, Dr. Elsie Siegel, Dr. Hiram E. Hart, Dr. Betty Rosoff, Dr. Herta Spencer and Dr. Daniel Laszlo), 919
Dietrich, G. : The Abyssal Circulation of the Ocean, 733
  Allgemeine Meereskunde, eine Einfuhrung in die Ozeanographie, *review* by Dr. G. E. R. Deacon, 1007
Dietz, Dr. Robert S. : Exploration of the Deep Ocean Floor, 779
Difference in the Behaviour of Tissues in Ancient Plant Remains and during Chemical Treatment (K. A. Chowdhury, S. S. Ghosh, R. V. Bhat and G. M. Vyas), 612
Difference in the Physiology of the Large Intestine between European and Indigenous Cattle in the Tropics (Dr. J. Quarterman, G. D. Phillips and G. H. Lampkin), 552
Difference (The Sex-linked), in Rabbit Neutrophils (P. J. Carpentier, L. A. M. Stolte and M. J. Dobbelaar), 554
Difference and Derivative Spectra (Dr. A. E. Martin), 231
Differences in the Food of the Young and the Adult Indian Mackerel, *Rastrelliger kanagurta* (Cuv.), (K. V. Narayana Rao and Dr. K. Pampapathi Rao), 711
Differences (Genetically-controlled), in Catalase Activity of Dog Erythrocytes (Dr. A. C. Allison and W. ap Rees, and G. P. Burn), 649
Differences (Individual), in Night-Vision Efficiency (M. H. Pirenne, F. H. C. Marriott and E. F. O'Doherty), 228
Different Dietary Fats : Effects of, on the Faecal End-Products of Cholesterol Metabolism (H. Gordon, B. Lewis, L. Eales and Prof. J. F. Brock), 923
Differential Equations, *review* by Dr. L. S. Goddard, 58
Differential Equations (S. V. Fagg), *review* by Dr. L. S. Goddard, 58
Differential Equations (Prof. Harry W. Reddick and Prof. Donald E. Kibbey), third edition, *review* by Dr. L. S. Goddard, 58
  Elementary (William Ted Martin and Eric Reissner), *review* by Dr. L. S. Goddard, 58
  Ordinary Non-Linear, in Engineering and Physical Sciences (Prof. N. W. McLachlan), second edition, *review* by Dr. L. S. Goddard, 58
  Partial (Transactions of the Symposium held at the University of California, 1955, on), *review* by Dr. L. S. Goddard, 58
  Partial (Prof. G. F. D. Duff), *review* by Dr. L. S. Goddard, 58
Differential Growth : The Quadratic Relation in (Dr. A. E. Needham), 1293
Differential Infra-red Spectroscopy : Identification of Edible Oils and the Detection of Oil Adulteration by (J. C. Bartlet), 1071
Differential Radiation Effect : Lack of, on the Incorporation of Labelled Precursors into Deoxyribonucleic Acid (L. G. Lajtha), 1048
Differential Thermal Characteristics of Peat (B. D. Mitchell), 1414
Differentiation of α-Amino-Acids and Amines by Non-Enzymatic Transamination on Paper Chromatograms (Dr. G. D. Kalyankar and Prof. Esmond E. Snell), 1069
Differentiation of Somatic and Autonomic Nerve Fibres in Tissue Sections (A. D. Dixon), 709
Differentiation (Colonial), between *Escherichia coli* B and *Escherichia coli* B/r (Prof. Leonard N. Zimmerman), 1217
Diffraction : Thomas Young and the Theory of (Prof. A. Rubinowicz), 160
Diffractometer (X-Ray) : Rapid Observation of Phase Transformation in Fibrous Proteins using an (Dr. A. R. B. Skertchly), 802
Diffusion of Zinc from Brass *in vacuo* : Effect of Stress on Hole Formation during the (Dr. L. M. T. Hopkin), 808
Digital Calculating Machines and their Application to Scientific and Engineering Work (G. A. Montgomerie), *review* by Dr. A. D. Booth, 823
Digital Calculators : Automatic—a Retrospect (Dr. A. D. Booth), 1089
Digital Computers (Automatic) : An Introduction to (R. K. Livesley), *review* by Dr. A. D. Booth, 1009
Digital Computers (Electronic) : The Management Approach to (J. Sandford Smith), *review* by Dr. A. D. Booth, 823
Digitoxin : Cis-Hydroxylation of (B. T. Brown, Prof. S. E. Wright and G. T. Okita), 607
Dihydro Diphosphopyridine Nucleotide : Intramolecular Transfer of Electronic Energy in (Dr. G. Weber), 1409
3,4-Dihydroxyphenylalanine and 5-Hydroxytryptophan as Reserpine Antagonists (Prof. Arvid Carlsson, Margit Lindqvist and Tor Magnusson), 1200
Dijksterhuis, Prof. E. J. : Galileo on the Ptolemaic and Copernican Systems, *review*, 450 ; 1374
Dilatometric Method of Following the Non-stationary State of Polymerization Reactions (Dr. W. I. Bengough), 1120
Dimbleby, G. W. : Pollen in Terrestrial Soils, 229
Dimensions (Cell) : Precision Determination of, by the Back-Reflection Weissenberg Method (F. H. Herbstein), 291
4-Dimethylaminoazobenzene Carcinogenesis in the Rat Liver : Role of Organ-Specific Antigen during (P. E. Hughes, C. J. Louis, J. K. Dineen and W. G. Spector), 289
Dimorphism (Sexual), in Labiatae (Audrey Plack), 1218
Dineen, Dr. J. K., and Ada, G. L. : Rapid Extraction with Ethyl Acetate of Free Fluorescein Derivatives from Fluorescein *iso*Cyanate–Globulin Conjugates, 1284
Dineen, Dr. J. K., and others : Role of Organ-Specific Antigen during 4-Dimethylaminoazobenzene Carcinogenesis in the Rat Liver, 289
Dingle, Prof. Herbert : Relativity and Space Travel, 500
  The Clock Paradox in Relativity, 1275
Dinosaurs (Dr. W. E. Swinton), 1399
Dioxide (Sulphur) : Reaction of Nitrates with Liquid (Dr. K. J. Ivin), 90
Dioxide (Titanium) : Nuclear Magnetic Resonance of Methane adsorbed on (Prof. N. Fuschillo and C. A. Renton), 1063
Diphosphopyridine Nucleotide (Dihydro) : Intramolecular Transfer of Electronic Energy in (Dr. G. Weber), 1409
Diptera : Coxo-Subalar Muscle in the Mesothorax of (Dr. John Smart), 339
Direct Structure Determination by Optical-Transform Methods (M. M. Crowder, K. A. Morley and Dr. C. A. Taylor), 431
Direction of Human Development (Prof. M. F. Ashley Montagu), *review* by Prof. T. S. Simey, 157
Directions of Magnetization in the Carboniferous Glacial Varves of Australia (E. Irving), 280
Directly Reacting Bile Pigment : Sodium Salt of the (Dr. Ed. Talafant), 1051
Directory of Crystallographers : World (Dr. W. Parrish), 892
Dirkx, J., and others : Role of Cations in Phage Adsorption to Sensitive Bacteria, 83
Dirt Removal from Cotton (R. E. Wagg and C. J. Britt), 48
Discharges in Hydrogen at the Ion Cyclotron Frequency (Dr. A. W. Bright and K. Ramanathan), 1468
Discontinuous System of Buffers : Starch Gel Electrophoresis in a (Dr. M. D. Poulik), 1477
Discovery of Element 102, 120
Discovery II : Geophysical Investigations made in the Atlantic from, in 1956 (Royal Society Discussion on), 10
Disease of the Larval Honeybee (*Apis mellifera* L.) caused by a Combination of *Streptococcus pluton* (*Bacillus pluton* White) and *Bacterium eurydice* White : European Foul Brood—a (L. Bailey), 1214
Disease (Christmas) : A Hitherto Unknown Blood Clotting Defect in Haemophilia and (Dr. F. Nour-Eldin and Dr. John F. Wilkinson), 990
Diseases in Wood : A Non-Destructive Method of Detecting (J. S. Ward and M. J. Woodman), 47
Diseases (Plant), and Human Welfare, *review* by F. C. Bawden, 1260
Diseases (Virus) : Use of Insecticides for the Control of (Association of Applied Biologists Symposium on), 1454
Disintegration (Actinomycete), of Raw Wool (Melva E. Phillipson), 1205
Dislocations in Metals and Inorganic Crystals : Observations on (Course of lectures at the University of Bristol), 467
Disney, H. J. de S. (Marshall, Dr. A. J., and) : Experimental Induction of the Breeding Season in a Xerophilous Bird, 647
Disorders : Human Blood Coagulation and its (Dr. Rosemary Biggs and Dr. R. G. Macfarlane), second edition, *review* by Dr. R. A. Kekwick, 1259
Disperse Systems : Rheology of (British Society of Rheology Conference on), 363, 957
Display (Biological) : Plastic Mounts for (Dr. Blodwen Lloyd), 737
Dissemination of Information : Documentation and, *review* by Prof. S. I. Tomkeieff, 674
Dissmann, Dr. E. : Biological Rhythms, 1100
Dissociated Peroxide Vapour : Nature of the Product condensed at Low Temperatures from (R. L. Allen and Dr. F. S. Stone), 752
Distinguished Thermodynamics, *review* by Prof. N. K. Adam, 673
Distortion of Fluid Drops in the Stokesian Region (Prof. F. H. Garner, K. B. Mathur and V. G. Jenson), 331
Distortion (A Lattice), of Alkali Chloride Crystals in the presence of Nucleoprotein Microfibrils (J. C. White and P. C. Elmes, and V. Balashov, Prof. R. D. Preston and G. W. Ripley), 696
Distribution of Chiasmata in an 'Asynaptic' Locust (Dr. H. Rees), 559
Distribution of 5-Hydroxytryptamine in a Sea Anemone : Identification and (A. P. Mathias, D. M. Ross and Dr. M. Schachter), 658
Distribution of Ribonucleic Acid in Tumour Cells during Mitosis (Dr. Robert Love), 1338
Distribution of Sodium, Potassium and Water in the Rat : Effect of Angiotonin on the (Prof. Sydney M. Friedman, Constance L. Friedman and Miyoshi Nakashima), 194
Distribution of Strontium-90 in Pond Weed and Fish (K. W. E. Bidwell and Eileen E. Foreman), 1195
Distribution conjointe de la température et de l'humidité de l'air au Congo Belge (Dr. F. Bultot), 219
Distribution (Intracellular), of Catecholamines in the Brain (Dr. A. Weil-Malherbe and A. D. Bone), 1050
Distribution (Size), of Pores : Permeability and the (Dr. T. J. Marshall), 664
Disturbances (Travelling), in the Ionosphere—Changes in Diurnal Variation (Dr. G. H. Munro), 1252
Disulphides and Thiosulphates : Thiols,—some New Reactions and Possibilities in Peptide and Protein Chemistry (Dr. J. M. Swan), 643
Ditchburn, Prof. R. W. : Materials for Nuclear Engineering (Irradiation Effects in Insulating Crystals), 468
  Visual Problems of Colour (Importance for Colour Perception of the Time during which the Retina is exposed to a Particular Pattern of Stimulation), 1397
Diurnal Cycle in the Mitotic Activity of Ascites Tumour Cells in Mice (Dr. L. P. S. Agrell and Elsa Welin-Berger), 705
Diurnal Variation : Travelling Disturbances in the Ionosphere—Changes in (Dr. G. H. Munro), 1252
Diurnal Variation in the Occurrence of 'Dawn Chorus' (Joseph H. Pope), 433
Divergent Electron Beam : Study of the Magnetic Leakage Field in Cobalt by means of a (Dr. M. Blackman and E. Grunbaum), 1189
Diving : Underwater Swimming and (British Association for the Advancement of Science, Section I (Physiology), Discussion on), 883
Diving Birds : Right-Ventricle Pressures and Heart-Rate in (Einar Eliassen), 512
Division of Yoshida Sarcoma Cells : Effects of Kinetin on (Yoshito Ogawa, Yukihide Abe and Kenjiroo Fujioka), 985
Divorce : Dynamics of, *review* by Dr. Clifford Allen, 4
Dixon, A. D. : Differentiation of Somatic and Autonomic Nerve Fibres in Tissue Sections, 709
Dmitrenko, I. M., and others : Low-Temperature Physics (Influence of Pressure on the de Haas—van Alphen Effect), 461

Dobbelaar, M. J., and others : The Sex-linked Difference in Rabbit Neutrophils, 554
Documentation in Action (Jesse H Shera, Allen Kent and James W. Perry), *review* by Prof S. I. Tomkeieff, 674
Documentation and Dissemination of Information, *review* by Prof S. I. Tomkeieff, 674
Dodd, Dr. Barbara E. (Boorman, Kathleen E., and) · An Introduction to Blood Group Serology, *review* by Dr. F Stratton, 675
Dodgson, K. S. Biochemistry of Sulphur (Sulphatases), 466
Doery, Hazel M : Additional Purine Compounds in the Venom of the Tiger Snake (*Notechis scutatus*), 799
Dog · An Experimental Attempt to Determine the Site of the Neurohypophysial Osmoreceptors in the (P. A. Jewell and Prof. E. B. Verney), 129
Dog Erythrocytes Genetically-controlled Differences in Catalase Activity of (Dr A. C Allison and W. ap Rees, and G. P Burn), 649
Dog's Lymphocytes and Polynuclears . Cholinesterase Content of the (Dr A. J Philippu), 438
Dogs : Treatment of Cancer in, by Intravenous Methylene Blue (R. T. Pursell), 1300
Doling, D A. (Richardson, D. E., and) . Potato Blight and Leaf-Roll Virus, 866
Dollfus, Dr. A., and others Solar Granulation and its Observation from a Free Balloon, 211
Domestic Burning Accidents Flammability of Apparel Fabrics in relation to (British Standards Institution), 1102
Domestic Food Consumption and Expenditure, 1955—Annual Report of the National Food Survey Committee (Ministry of Agriculture, Fisheries and Food), 587
Domestic Rabbit (*Oryctolagus cuniculus*) and Hare (*Lepus europaeus*) : An Attempt to Cross the (Dr C E. Adams), 853
Donald, Prof M B. : Chemical Engineering Education (Development of the Postgraduate Diploma Course), 126
Doncaster, J. P. . Middle-Eastern Aphidoidea, *review*, 1441
Donner, K O Visual Problems of Colour (Bearing on Colour Vision of the latest work on the Electroretinogram and the Spike Discharges from Retinal Elements), 1396
Donor Element in Germanium : Oxygen as a (G. Elliott), 1350
Dormans, H N M , and others : At the Second International Conference on Coal Science (Properties, or the Thermal Decomposition Products, of Maceral Concentrates), 418 ; (Dilatation of various blends of Coals and Coke on Heating), 419
Dose-Levels (High), of Cobalt-60 γ-Rays : Response of the Ceric-Cerous System at (B. Whittaker), 1302
Dose-Rate Effects in Radiation-induced Chemical Reactions (Dr H. C. Sutton and Prof J. Rotblat), 1332
Doty, Prof Paul : Macromolecular Chemistry (Biological Polymers), 841
Double Meanings, *review* by Dr A D. Booth, 823
Doudoroff, Prof Michael, and others : The Microbial World, *review* by Dr A. T R. Mattick, 519
Dougill, Maryon W. : Crystal Structure of Calcium Monoaluminate, 292
Douglis, A., and others (edited by) . Transactions of the Symposium on Partial Differential Equations held at the University of California, 1955, *review* by Dr L. S Goddard, 58
Dow, M G. C M. (Barnett, the late Dr. A John G., and) : Utilization of Carbohydrate Metabolites by Rumen Micro-organisms, 548
Downes, Dr R. T. · Tree Physiology (Photoperiodism), 78
Doyle, H. A. : Seismic Recordings of Atomic Explosions in Australia, 132
Doyle, Prof J. : Aspects and Problems of Conifer Embryology (Presidential Address to Section K (Botany), of the British Association for the Advancement of Science), 485
Ecology of Grasslands, 1173
Drag (Aerodynamic), of Perforated Plates (J. R. D Francis and P. Minton), 702
Drake, W. D. (Briggs, D. K. H , and) : Prediction of Critical Temperatures, 1353
Dramatic Universe · The (J G. Bennett), Vol. I, The Foundations of Natural Philosophy, *review* by Dr S. Raimes, 302
Draper, Prof H. H. : Ineffectiveness of Selenium in the Treatment of Nutritional Muscular Dystrophy in the Rabbit, 1419
Dreicer, H. Ionization Phenomena in Gases (Run-away Electron Phenomena), 793
Drever, Prof J. : Instinct in Man, *review*, 1257
Drew, Dr. Kathleen M : The Red Algae (1906-56 and After), 112
Obituary by Dr. Mary Calder, 889
Drew, Dr. Kathleen M , and Friedmann, I. . Occurrence of Motile Gametes in *Prasiola stipitata* Suhr, 557
Drewry, J (Aschaffenburg, R , and) : Genetics of the β-Lactoglobulins of Cow's Milk, 376
Dreyfuss, Dr. R. W., and Levy, Dr. P. W. : Initiation and Growth of Explosion in Solids (Lamellar Twinning and Decomposition in Potassium Azide and Sodium Azide), 74
Dried Lanterns from Fireflies (*Photinus pallens*), (Medical Research Council Tropical Metabolism Research Unit, University College of the West Indies), 1454
Drier Habitats : An Inherent Character of Plant Species of (Dr. M L. R. Pettersson, S K. F Ellis, G. E. J. Gray and R. S. Smith), 698
Drischel, H : Biological Rhythms (Experiments to Synchronize Pairs of Regular Sequences of Light Flashes, Acoustic Clicks and Taps on the Finger Tip), 1101
Driver, C. M. : Infection of Native *Solanum* Species by the Potato Blight Fungus, 1367
Droop, M R. : Vitamin B_{12} in Marine Ecology, 1041, *erratum*, 1239
Drops (Fluid) Distortion of, in the Stokesian Region (Prof. F. H. Garner, K. B Mathur and V. G Jenson), 331
Drosophila Dwarf, produced by Ethylene Diamine Tetra-acetic Acid—a Relationship to Chelation of Zinc (Dale Steffensen), 390
A New Technique for the Study of Laboratory Populations of (J. A. Thomson), 1495
Drosophila melanogaster : Autonomous Action of Lethal Mutations induced in the Germ Cells of, by 2-Chloroethyl Methanesulphonate (C. E. Purdom), 81
Mutagenic Response to the Alkyl-Methanesulphonates during Spermatogenesis in (Dr O. G. Fahmy and Dr. Myrtle J. Fahmy), 31
Drugs : Mechanism of Contraction of Smooth Muscle by (Dr. D H. L Evans and Dr. H. O. Schild), 341
The Pharmacology of Psychotomimetic and Psychotherapeutic— Conference held by the Section of Biology, New York Academy of Sciences, 1956 (consulting editor, Seymour S. Kety), *review* by Dr. Marthe Vogt, 304
Quantal Response to Mixtures of (P. S Hewlett and R. L Plackett), 712
Tranquillizing—a Symposium held under the auspices of the American Association for the Advancement of Science in co-operation with the American Psychiatric Association and the American Physiological Society at Atlanta, 1955 (arranged and edited by Harold E. Himwich), *review* by Dr Marthe Vogt, 304
Drummond Junior Fellowship in Nutrition awarded to J. F. D. Greenhalgh, 688
Drury, R. A B. (Carleton, H.M , with the collaboration of) · Histological Technique for Normal and Pathological Tissues and the Identification of Parasites, third edition, *review* by Prof. J Bronte Gatenby, 1079
Dry Tobacco Mosaic Virus . Ultra-violet Irradiation of (Albert Siegel), 1430
Dryden, Dr I G. C · Coal Science, 417
Dryden, Dr. I G. C., and Pankhurst, K. S : At the Second International Conference on Coal Science (Extracting, with Chloroform, Fusible Material developed by Coking Coals on Heating), 419
Drying Freezing and (Institute of Biology International Symposium on), 838
Drying of Thick Porous Bodies during the Falling-Rate Period : Mechanism of (Prof. A. H. Nissan and W. G. Kaye), 142
Drysdall, A R : Appointed geologist, Northern Rhodesia, 21

  Solar Energy and the Depth of the (N. V. Belov and V. I. Lebedev), 1324
Earth Satellite (Artificial), 719, 734
  Life-time of an (J. A. Fejer), 1413
  Observations at Jodrell Bank, 890
  Orbit of the, 784
  Photograph of the Track of the, 835
  Rocket of the First, 944
  End of the Rocket of the First, 1392
  The Second, 931
Earth Satellite (First Russian) : Observations on the Orbit of the (Staff of the Royal Aircraft Establishment, Farnborough), 937, *erratum*, 1028
Earth Satellite (Russian) : Radio Observation of the (Staff of the Mullard Radio Astronomy Observatory, Cambridge), 879
Earth Satellite (Russian Artificial) : Observations of the, and their Analysis (Royal Society Discussion on), 953
Earth Satellite (First Russian), and Carrier Rocket : Radar Observations of the (Staff of the Jodrell Bank Experimental Station, University of Manchester), 941
Earth Satellite (Second Russian Artificial) : Orbit of the, 1026
Earth Satellites (Russian), and the International Geophysical Year, 1027
Earth's Inner Core : Evidence relating to the, from Hydrogen Bomb Explosions in 1954 (Prof. K. E. Bullen and T. N. Burke-Gaffney), 49
Earth's Structure : A Geochemical Hypothesis of the (A. F. Kapustinsky), 1245
Earthquakes in Persia, 121
Earthquakes in Turkey, 121
East (Middle) : The Aphidoidea of the (Prof. F. S. Bodenheimer and Dr. E. Swirski), *review* by J. P. Doncaster, 1441
  Economic Developments in the (1955-56), 785
East (Nearest) : Adventures in the (Prof. Cyrus H. Gordon), *review* by M. C Burkitt, 1154
East Africa High Commission : Appointment of A. Rogerson as senior scientific officer, East African Veterinary Research Organization, 21
  Appointment of J. M. B. Harley as senior scientific officer, 21
  Appointment of C. M. Leslie as scientific officer, East African Industrial Research Organization, 220
  Appointment of W. N. Scott as deputy director, East African Trypanosomiasis Research Organization, 413
  Report for 1956 of the East African Agriculture and Forestry Research Organization, 786
  Appointment of R. M. C. Williams as senior scientific officer, 1098
  Appointment of D. J. L. Casley as statistician, 1098
  Appointment of J. A. Channon as senior meteorologist, East African Meteorological Department, 1454
East African Agriculture and Forestry Research Organization : Report for 1956, 786
East African Dwarf Goat : Effect of Contrasted Planes of Nutrition on the Carcass Composition of the (Dr. P. N. Wilson), 145
East African Industrial Research Organization : Appointment of C. M. Leslie as scientific officer, 220
East African Meteorological Department : Appointment of J. A. Channon as senior meteorologist, 1454
East African Trypanosomiasis Research Organization : Appointment of W. N. Scott as deputy director, 413
East African Veterinary Research Organization : Appointment of A. Rogerson as senior scientific officer, 21
Eastoe, J. E., and Leach, A. A. : Recent Advances in Gelatin and Glue Research (Amino-acid Composition), 691
Easty, Dr. D M., and others A Cell Compressor for the Measurement of Mass and Concentration by Interference Microscopy, 1487
Easty, Drs. G. C. and D. M. : Biological Aspects of Cancer (Nature of the Cell Surface), 832
Ebeid, F. B., and others : Point of Attack in Hydrocarbon Oxidation, 188
Ebina, Prof. T., and others. Morphological Changes of Tubercle Bacilli caused by Staining Procedures, 42
Eccles, Sir David : Capital for Scientific Development, 307
Eccles, Prof. John Carew : The Physiology of Nerve Cells, *review* by Prof. Ragnar Granit, 724
Eccles-Jordan Flip-Flop Circuit : Analysis of Bistable Multivibrator Operation—the (P. A Neeteson), *review* by Dr. R. L. Smith-Rose, 401
Echoes : Audio-frequency Nuclear-resonance (Dr. J. G Powles and D. Cutler), 1344
Eckhardt, Dr. E. A. : Appointed assistant director of the United States National Science Foundation, for the Division of Mathematical, Physical and Engineering Sciences, 169 ; work of, 169
Eckstein, Dr. Z., and others : Fungistatic Activity of some Hydroxamic Acids, 1204
Ecologists in the Laboratory, *review* by Dr. S. D. Garrett, 351
Ecology : Microbial—Seventh Symposium of the Society for General Microbiology, London, 1957 (edited by R. E. O. Williams and C. C. Spicer), *review* by Dr. S D. Garrett, 351
  Research Studentships for Postgraduate Training in (Nature Conservancy Awards for 1957), 467
Ecology of Grasslands (British Association for the Advancement of Science, Sections K (Botany) and M (Agriculture), Joint Discussion on), 1173
Ecology (Marine) : Vitamin B_{12} in (M. R. Droop), 1041, *erratum*, 1239 ; (K. W. Daisley), 1042
Economic Analysis (Prof. Edmund Whittaker), *review* by Prof. Gilbert Walker, 1441
Economic Developments in the Middle East (1955-56), 785
Economics : Mathematical (Prof. R G. D. Allen), *review* by Prof. D. G. Champernowne, 876
Economics of Atomic Energy (Mary Goldring), *review* by Dr. J. V. Dunworth, 1266
Economics of Atomic Power Development in India and the Indian Atomic Energy Programme (Dr. H J. Bhabha), 1382
Economics of Nuclear Energy, *review* by C. A. Rennie, 673
Economics of Nuclear Power including Administration and Law (edited by J. Guéron, J. A. Lane, I. R. Maxwell and J R. Menke), Vol. I, *review* by C. A. Rennie, 673
Economics and Common Sense, *review* by Prof. Gilbert Walker, 1441
Economics (Agricultural), Centre for (Portugal) : Grant of £15,500 from the Calouste Gulbenkian Foundation, Lisbon, to establish and run the new Centre as part of the Foundation's own activities, 1027
Economics : Model Building for, *review* by Prof. D. G. Champernowne, 876
Economy (British) : The Role of Agriculture in (Sir James Turner), 486
Economy (National) : Coal and Coal Chemicals in the (Dr. J. Bronowski), 636
  Dalton Exhibition of the Royal Institute of Chemistry, 637
Ectromelia in a Mouse-breeding Colony : Attempted Control of (A E. G. Pearson), 1300
Eddington (Arthur Stanley) Memorial Lecture (Dr. H. C. Wood), *review* by F. I. G. Rawlins, 676
Edels, H. : Ionization Phenomena in Gases (Glow to Arc Transition in the Column and at the Cathode of a Hydrogen Discharge), 792
Eden, Dr R. J : Atomic Structures, *review*, 822
Edible Oils : Identification of, and the Detection of Oil Adulteration by Differential Infra-red Spectroscopy (J. C. Bartlet), 1071
Edinburgh, H.R.H. the Duke of : Study Conference on the Human Problems of Industrial Communities within the Commonwealth and Empire (Oxford, 1956), *review* by Dr. W. H. Scott, 876
Editors of "Nature" : The Treatment of the Mentally Ill, 868
Edmonds, C. J. : Appointed to the Boots Research Fellowship for work in the Department of Pharmacology and Therapeutics, University of Sheffield, 893
Edney, Margaret, and others : Infectivity of Influenza Virus Filaments, 1134
Education : Bilingualism in (British Association for the Advancement of Science, Sections L (Education) and J (Psychology), Joint Discussion on), 689
  Chemical Engineering (Symposium at the University of Birmingham), 125
  Knowledge and (Dr. J. Bronowski), 843
Education, Ministry of : The Supply and Training of Teachers for Technical Colleges, 53
Education of the Countryman (L. R. Missen), 486
Education for Development (Sir Sydney Caine), 1099
Education for Management, 153
Education for Modern Needs, 1149
Education for Technologists, 619
Education and Training for the Engineering Industry (Sir David Anderson), 482
Education and the Under-developed Territories, 1099
Education (Further), in the North of England, 1323
Education (Further), Northern Advisory Council for : Tenth Annual Report, 1323
Education (Higher Technological), London and Home Counties Regional Advisory Council for : Bulletin of Special Courses in Advanced Technology, 635
  Research for Industry, 785
Education (Scientific), in Schools : Report on the Industrial Fund for the Advancement of, 103
Education (Technical) : Progress in, 1238
Education (Technical), and Industrial Training in Malta, 532
Education (University) : Corporate Life in, 1005
Educational Awards for 1957-58 (Animal Health Trust), 412
Educational Foundation for Visual Aids (Mullard, Ltd., and the) : Film 'Mirror in the Sky' awarded the Premier award in the Films for Use in Schools Section of the Festival of Films in the Service of Industry, 891
Edwards, Dr A. G. : Awarded the Heinrich Hertz Premium of the British Institution of Radio Engineers, 529
Edwards, Dr. D. H., and Williams, G. T. : Effect of Tube Diameter on the Pressures in Gaseous Detonation Waves, 1117
Edwards, Dr. R. G. (Sirlin, Dr. J. L., and) : Duration of Spermatogenesis in the Mouse, 1138
Edwards, R. L. : *Sporendonema*, 1374
Edwards, R W. : Vernal Sloughing of Sludge Deposits in a Sewage Effluent Channel, 100
Eel (Freshwater), *Anguilla obscura* Gunther, 1871, in Southern Africa (R. A Jubb), 1216
Eels, a Biological Study (the late Prof. Léon Bertin), *review* by Dr. E. Trewavas, 350
Eels in Southern Africa (R. A. Jubb), 47
Eelworm (Beet), *Heterodera schachtii* Schmidt : Development of, in the Wild Beet, *Beta patellaris* (Audrey M. Shepherd), 341
Eelworm (Potato Root) : Chromosomes of the (Dr. Ralph Riley and Victor Chapman), 662
  Development of Isolated Female Larvae of the (T. D. Williams) 1000

Eelworm (Potato-Root) Hatching Factor : Cardiotonic Activity of the (Dr C. Ellenby and A. B. Gilbert), 1105
Eelworm Problem : The Friendly Fungi, a New Approach to the (C. L. Duddington), *review* by R Chamberlain, 936
Effect . The Tanberg (M. P. Reece), 1347
Effect of Acetylcholine and Quinidine on Atrial Cellular Potentials (Dr. Edward A. Johnson and Dr. P. A Robertson), 1483
Effect of the Afforestation of Catchment Areas upon Water Yield (Dr. P. J Rennie), 663
Effect of Analogues on the Uptake of Vitamin B_{12} by the Intact Rat (Dr. A. L Latner and Dr Laureen Raine), 1197
Effect of Benzimidazole on Detached Wheat Leaves (Dr. Clayton Person, Dr D J Samborski and Dr. F R Forsyth), 1294
Effect of varied Concentration Gradients : Transport of Potassium-42 and Rubidium-86 on Kidney Cortex Slices—the (A Kleinzeller and Dr. J H. Cort), 1124
Effect of Desiccation on the Eggs of *Simulium damnosum*, Theobald (Dr. R. C. Muirhead-Thomson), 1432
Effect of Different Dietary Fats on the Faecal End-Products of Cholesterol Metabolism (H Gordon, B. Lewis, L. Eales and Prof. J F Brock), 923
Effect of Exteroceptive Factors on the Œstrous Cycle of Mice (W. K. Whitten), 1436
Effect of Flavin Monosulphate on Old Yellow Enzyme (Prof. Hugo Theorell, Kunio Yagi, George D. Ludwig and Fujio Egami), 922
Effect of Gamma Rays on the Sprouting of Stored Mangolds (C. E Cornford and D. B Powell), 996
Effect of Gibberellic Acid on Elongation of Pea Stems : Relationship between Shoot Apex and (A. J Vlitos and W Meudt), 284
Effect of Hexylresorcinol on Bacterial Aerosols (H. M Darlow and E O. Powell), 1425
Effect of High-Energy Radiation on Polypropylene (Dr R. M. Black and Dr B. J. Lyons), 1346
Effect of Hypoglycin A on the Alpha Cells of the Pancreas (Dr P. C Feng), 855
Effect of Leaf Rust on Cereal Forage (A. F. Greenall), 1000
Effect of Nitric Oxide on the Radiosensitivity of Bacteria (P. Howard-Flanders), 1191
Effect of Oxygen on the Carrier Life-time in Silicon (D. H. Roberts, P. H. Stephens and P H. Hunt), 665
Effect of Prolonged Administration of Reserpine on the Endocrine Glands of the Rat (Prof O. Eranko, V Hopsu, E Kivalo and A. Telkka), 1130
Effect of Prolonged Thyroid Administration on Aged Male Rats (Dr Lloyd Glenn McArthur, Prof. John F Lhotka and Dr Arthur A. Hellbaum), 1123
Effect of Radiation on Human Heredity (*Chronicle* of the World Health Organization, Vol. 11, No 8, Report on), 1178
Effect of the Saturnian Ring upon the Motion of the Satellites (Yoshihide Kozai), 837
Effect of Storage of Methylcellulose on Blood Protein Formation in the Rat (Margaret M. Frohlich, V. Balázs and S. Benko), 1474
Effect of Stress on Hole Formation during the Diffusion of Zinc from Brass *in vacuo* (Dr L M T Hopkin), 808
Effect of Tube Diameter on the Pressures in Gaseous Detonation Waves (Dr. D H Edwards and G T Williams), 1117
Effect of Ultra-violet Light on Mouse Skin over a Wide Range of Intensities (Prof S Claesson, G Wettermark and L Juhlin), 992
Effect of Ultra-Violet Radiation on the Respiration-Rates of Tobacco Leaves, and its Reversal by Visible Light (Dr. P. C. Owen), 610
Effect (Antitumour), of Culture Media from Tumour-immune Spleens (E. Holečková and Dr. B Sekla), 1298
Effect (Inhibitory), of 5-Hydroxytryptophan on Acid Gastric Secretion (A. N Smith, J. W Black and E. W. Fisher), 1127
Effect (A Physiological), of Triethanolamine on the Development of *Sclerotium rolfsii* (Secc.), (S Lavee), 1494
Effect (An Unexpected), in Sound Localization (D H Holding and J. P. Dennis), 1471
Effective Agent for Eliminating *F*-factor in *Escherichia coli* K-12 . Acriflavine as an (Yukinori Hirota and Teiji Iijima), 655
Effective Industrial Management (James L. Jundy), *review* by T H. Hawkins, 1078
Effects of Gamma-ray Irradiation on Nematodes infesting Cultivated Mushroom Beds (F. C. Wood and J. B. Goodey), 760
Effects of Ionizing Radiation, *review* by Dr. T. E Allibone, 771
Effects of Irradiation : Nuclear Chemistry and (Proceedings of the International Conference on the Peaceful Uses of Atomic Energy, Geneva 1955, Vol 7), *review* by Dr T E. Allibone, 771
Effects of Kinetin on Division of Yoshida Sarcoma Cells (Yoshito Ogawa, Yukihide Abe and Kenjiroo Fujioka), 985
Effects of Methylene Blue added to a Low Fat Diet in the Mouse (A Fajer), 1054
Effects of Oxygen upon Light Absorption by Green Algae (Prof. Britton Chance and Bernard Strehler), 747
Effects of Red and Far-Red Radiation on Seed Germination (Avishag Kadman-Zahavi), 996
Effects of Sarcomycin on the Metabolism of Ehrlich Ascites Carcinoma Cells (I J Bickis, Dr. E. H Creaser, Prof J H Quastel and Dr P G Scholefield), 1109
Effects (Biological), of Radiation (Proceedings of the International Conference on the Peaceful Uses of Atomic Energy, Geneva 1955, Vol 11), *review* by Dr. T. E Allibone, 771
Effects (Dose-Rate), in Radiation-induced Chemical Reactions (Dr H C. Sutton and Prof J. Rotblat), 1332
Effects (Lethal), on Plant Cells of Fungal and Bacterial Extracts (S. G. Fushtey), 20
Effects (Metabolic), of Thyroglobulin : Metabolism and (Alister Craig, Brian Fox and Harold Jackson), 195
Effects (Steric), in Organic Chemistry (edited by Melvin S. Newman), *review* by Dr P B D. de la Mare, 822
Effects (Unloading), in Copper Single Crystals (Dr. M. J. Makin), 1476
Efficiency of Ion Transport in Biological Systems (Dr. J. F. Sutcliffe and D P. Hackett), 95
Effluent Channel (Sewage) · Vernal Sloughing of Sludge Deposits in a (R W Edwards), 100
Efford, I. E. : Awarded a Nature Conservancy Research Studentship for Postgraduate Training in Ecology (Zoology), 467
Egami, Fujio, and others . Effect of Flavin Monosulphate on Old Yellow Enzyme, 922
Egelstaff, Dr. P. A. Promoted to Senior Principal Scientific Officer by the United Kingdom Atomic Energy Authority, 639 ; work of, 639
Egerton, Dr. G. S., and Roach, A. G : Photochemistry of Polymer Films, 189
Photochemical Stability of Dyes in the Solid State, 1349
Egg (Diapause), of the *Bombyx* Silkworm : Conversion of Glycogen to Sorbitol and Glycerol in the (Haruo Chino), 606
Eggert, Prof. J. Initiation and Growth of Explosion in Solids (Initiation by Light), 74
Eggs of *Simulium damnosum*, Theobald · Effect of Desiccation on the (Dr. R C Muirhead-Thomson), 1432
Eggs (Unfertilized) · Hermaphroditism and Self-Fertilization and the Monthly Extrusion of, in the Viviparous Fish *Lebistes reticulatus* (Dr. H. Spurway), 1248
Egvin, J. · The Abyssal Circulation of the Ocean, 733
Ehrenberg, Dr Lars, and others . Gonad Temperature and Spontaneous Mutation-rate in Man, 1433
Ehrendorfer, F . Systematics of To-day (Die geographische und okologische Entfaltung des europaisch-alpinen Polyploidenkomplexes *Galium anisophyllum* Vill. seit Beginn des Quartars), 741
Ehrlich, Paul The Collected Papers of (compiled and edited by Dr F Himmelweit, with the assistance of Martha Marquardt, under the editorial direction of Sir Henry Dale), Vol I, Histology, Biochemistry and Pathology), *review* by Prof. C. H Browning, 620
Ehrlich Ascites Carcinoma Cells · Effects of Sarcomycin on the Metabolism of (I. J. Bickis, Dr E. H. Creaser, Prof. J H. Quastel and Dr. P. G. Scholefield), 1109
Ehrlich Ascites Tumour · How does the, obtain its Energy for Growth ? (A Kemp and Prof. B. Mendel), 131
Eiber, Prof. Harold B., and Danishefsky, Prof. Isidore : Clearance of Injected Heparin from the Blood, 1359
Eichelberger, Dr. R. J. (Lampson, Dr. C W , and) : Initiation and Growth of Explosion in Solids (Growth of Explosion), 74
Eimeria rissae, n.sp. Eimeriidae, *Sporozoa* A New Species of Coccidium, from the Kittiwake, *Rissa tridactyla tridactyla* (L), (Dr E. J. L. Soulsby and A. R Jennings), 1057
Eisen, Dr. V D , and Harris, Dr F. T C · Demonstration of Early Renal Uptake of Potassium-42 by an Autoradiographic Method for Water-soluble Isotopes of Short Half-life, 440
Eisenklam, Dr. Paul : Flow through Porous Media, *review*, 1008
Eisenstein, Victor W. (edited by) . Neurotic Interaction in Marriage, *review* by Dr. Clifford Allen, 4
El Mofty, M. M : Cytochemical Localization of Acid Phosphatase in *Trichonympha turkestanica* Bernstein (Trichonymphina, Trichonymphidae), 1367
Elastic Constants of Hardened 1 per cent Carbon Steels on Tempering · Variation of (A F C Brown, A G. Cole and M. F. Markham), 1254
Elasticity (Crystal) . Theories of (N Joel and Dr W. A Wooster), 430
Elastin, a Metabolically Active Lipoprotein (Dr. Frank S Labella), 1360
Elastomers Rheology of (British Society of Rheology Conference on), 75
Elderfield, Robert C (edited by) : Heterocyclic Compounds, Vol 5, Five-Membered Heterocycles containing Two Hetero Atoms and their Benzo Derivatives, *review* by Prof R A Raphael, 352
Electric Discharge Devices : Preferential Ionization of Argon in the Presence of Air and its Application to (D P. C. Thackeray), 913
Electric Strength of Unsaturated Hydrocarbon Gases (Dr. A E. D. Heylen), 703
Electrical Applied Physics Introduction to (Prof N. F. Astbury), *review* by H. Kayser, 875
Electrical Determination of Cold Hardiness in *Trifolium repens* L. and *Medicago sativa* L (C. G. Greenham and H. Daday), 541
Electrical Engineering at Queen's University, Belfast, 1168
Electrical Engineering at the University of Sheffield—New Laboratories, 414
Electrical Engineering Tensors in (Extra-Mural Department of the University of Liverpool Residential Course on), 369
Electrical Engineers: The *j* Operator for (Philip Kemp), *review* by Prof A. Tustin, 1263
Electrical Engineers, Institution of Election of Officers, 72
  Presidential Address (T E Goldup), 784
Electrical Engineers, Institution of (Radio and Telecommunication Section) : Discussion on Radio Observations on the Russian Satellite, 953
Electrical Research Association . New Laboratories at Leatherhead, 260
  Appointment of L. Gosland as research manager, 738
  Appointment of E. E. Hutchings as head of the Member Relations Department, 738
  Appointment of A M Cassie and Dr. L. H Orton as joint heads of the Switchgear Department, 738
  Appointment of Dr. G Mole and Dr. F. Busemann as head and deputy head of the Transmission and Utilization Department, 738
Electrical Science, *review* by H Kayser, 875
Electrical and Allied Industries Research Association, British : Annual Report (Prof J Greig), 271
Electricity : Atmospheric (Dr J Alan Chalmers), *review* by Dr B. J Mason, 402
Electricity Industry . Annual Report, 1321
Electrocapillary Behaviour of Ions A Unified Theory of the Mechanism of Inhibition of Corrosion of Iron in Acid and Neutral Media based on the (C. P De), 803
Electrode Potentials (Local) · Study of Strain Distribution in Metals by the Determination of (Prof Hugh O'Neill and Dr. D Eurof Davies), 498
Electrodes (Skin) Use of 'Nobecutane' in attaching (Flight-Lieut M. Kennedy Browne), 192
Electroencephalograph : The Repetitive Property of the Human Brain as studied by the, and the Method of After-Images (Dr. Catherine Popov), 328
Electroluminescence Effect . A Surface, in Diamonds (Dr. H. F. Logie and R. R. Urlau), 1254
Electrolyte containing Fluoride : Some Properties of Chromium deposited from an (N E. Ryan, F Henderson, S. T. M. Johnstone and H L. Wain), 1406
Electrolyte Physiology (British Association for the Advancement of Science, Section I (Physiology and Biochemistry), Discussion on), 1017
Electrolytes (Fused) : Hexagonal Chromium Crystals from (Dr. R. S Dean and F X. McCawley), 435

Electron Beam (Divergent) : Study of the Magnetic Leakage Field in Cobalt by means of a (Dr M Blackman and E. Grunbaum), 1189
Electron Micrographs of Cross-Sections of Protein Monolayers (E. H. Mercer), 87
Electron Microscope Studies on Colloidal Silver Iodide employing Cinematographic Techniques (R. W. Horne and Dr. R. H. Ottewill), 910
Electron Microscope Studies of Macromolecules (Dr R W. G. Wyckoff), 956
Electron Microscopy · Polyhedral Shape of Adenovirus Particles as shown by (Dr R. C. Valentine and Dr. P. K. Hopper), 928
Electron Microscopy of Leaf Surfaces (D. E. Bradley and B. E. Juniper), 330
Electron Model : Chemical Shifts in $C_6H_6^-$ and $C_7H_7^+$ Ions—the Free (J. R. Leto, F. A. Cotton and Dr. J. S. Waugh), 978
Electron Physicist's Vade-Mecum, *review* by Dr. V. E. Cosslett, 1264
Electron Resonance : Binding in Haemoglobin Azide as determined by—Electron Resonance Studies of Haemoglobin Azide and Hydroxide Derivatives (J. F. Gibson and Dr. D. J. E. Ingram), 29 ; Theory of Electron Resonance in Ferrihaemoglobin Azide (J S. Griffith), 30
  Theory of, in Ferrihaemoglobin Azide (Binding in Haemoglobin Azide as determined by Electron Resonance), (J. S. Griffith), 30
Electron Resonance Studies of Haemoglobin Azide and Hydroxide Derivatives (Binding in Haemoglobin Azide as determined by Electron Resonance), (J. F Gibson and Dr. D. J E. Ingram), 29
Electron and Proton Resonance in a Common Magnetic Field : A Frequency Comparator using (O Nourse), 192
Elektronenphysik, Ionenphysik und Übermikroskopie : Tabellen der (Baron Manfred von Ardenne), Band 1, Hauptgebiete ; Band 2, Hilfsgebiete, *review* by Dr. V E. Cosslett, 1264
Electronic Components (Royal Radar Establishment International Symposium on), 531
Electronic Digital Computers : The Management Approach to (J. Sandford Smith), *review* by Dr. A. D. Booth, 823
Electronic Energy : Intramolecular Transfer of, in Dihydro Diphosphopyridine Nucleotide (Dr. G. Weber), 1409
Electronic Image Devices in Microscopy, 71
Electronic Instruments Exhibition, Manchester (Dr. J. E. Geake), 536
Electronica, Acta (*Optica Acta* and) : Joint publication of the Proceedings of the International Symposium on the Physical Problems of Colour Television (Paris, 1957), 963
Electronics : The International Dictionary of Physics and, *review* by Dr. J. R. Tillman, 55
  Mechanics of, *review* by D. L. Johnston, 1154
  Premiums for articles on (Radio Industry Council), 1325
  Terminology in Physics and, *review* by Dr. J. R. Tillman, 55
Electronics in Automation (British Institution of Radio Engineers Convention on), 369
Electronics, Institution of (Northern Division) : Twelfth Annual Electronics Exhibition and Convention, 536
Electronics Exhibition and Convention (Northern Division of the Institution of Electronics), 536
Electronics Production : Mechanical Design for (John M. Carroll), *review* by D. L. Johnston, 1154
Electronics and Control, Journal of, 217
Electrophoresis (High-Voltage Paper), of Inorganic Cations—Alkali, Alkaline-Earth and other Metals (Dr. D. Gross), 596
Electrophoresis (Paper) : Location of Alpha-2-Globulin by Demonstration of Alkaline Phosphatase during (Dr. William Quitman Wolfson), 549
Electrophoresis (Starch Gel) : Serum Protein Differences in Cattle by (G. C. Ashton), 917
Electrophoresis (Starch-gel), of Animal Sera (Dr. A. L. Latner and Angel Habib Zaki), 1366
Electrophoresis (Starch Gel), in a Discontinuous System of Buffers (Dr. M D Poulik), 1477
Electrophoretic Behaviour (Anomalous) : A New Haemoglobin Variant exhibiting (Rose G Schneider and Mary Ellen Haggard), 1486
Electrophoretic Mobility and Viability of *Aerobacter aerogenes* · Relationship between the Concentration of Anionic Surface-active Agents and the (Dr D. E E Loveday and Dr. A. M. James), 1121
Electroretinogram : Relation of Size of, to Rhodopsin Concentration in Normal Human Beings and one Totally Colour Blind (Dr. V. Elenius and Dr. J. Heck), 810
Electrostatic Charges on Spores of Fungi in Air (Prof. P. H. Gregory), 330
Electro-Technology for National Certificate Courses (Dr. H. Buckingham and E. M. Price), Vol 2, *review* by Dr P. F. Soper, 1309
Elek, Dr. Stephen Dyonis : Appointed to the chair of bacteriology in St. George's Hospital Medical School, London, 316, 1172
Element 102 : Discovery of, 120
Element 102 (British Association for the Advancement of Science, Section B (Chemistry), Special meeting on), 361
Element (Donor), in Germanium : Oxygen as a (G Elliott), 1350
Element Nobelium : The New—Preparation of Trans-Uranium Elements (H. A. C. McKay), 1010 ; The Preparation of Nobelium (Dr. J. Milsted), 1012
Elementary Nitrogen : Mass-Spectrometric Assay of (Dr. J B. Capindale and Dr. D. H. Tomlin), 701
Elementary Particles : Physics of (Unesco, the Argentine Atomic Energy Commission, the University of Buenos Aires and the University of La Plata Symposium on), 412
Elementary Theory of Interspecific Competition (M H. Williamson), 422
Elements : Preparation of Trans-Uranium (H A C. McKay), (The New Element Nobelium), 1010
Elements of Pulse Circuits (Dr F. J. M. Farley), *review* by Dr. R. L. Smith-Rose, 401
Elenius, Dr. V., and Heck, Dr. J. : Relation of Size of Electroretinogram to Rhodopsin Concentration in Normal Human Beings and one Totally Colour Blind, 810
Elephant Seals on the Antarctic Continent (Susan E. Ingham), 1215
Elephants (Black and White), at Aldermaston (Dr. T. E. Allibone), 1178
Elgaroy, Ö. : Duration of Transients in Solar Radio Noise, 808
  Frequency Drift of Short-Time Transients in Solar Radio Noise, 862
Elgin, D C. (Ricketts, T. S., and) : Natural Gas in Scotland, 1444
Eliassen, Einar : Right-Ventricle Pressures and Heart-Rate in Diving Birds, 512
Elie, Robert : Our Debt to the Future (Human Values and the Evolution of Society), 260
Eliminating *F-factor* in *Escherichia coli K*-12 : Acriflavine as an Effective Agent for (Yukinori Hirota and Teiji Iijima), 655
Ellenby, Dr C., and Gilbert, A. B. : Cardiotonic Activity of the Potato-Root Eelworm Hatching Factor, 1105
Elliott, —. : Transference of Rust-resistance to Bread Wheats, 736
Elliott, Dr. A., and others : Optical Rotation and Infra-Red Spectra of some Polypeptide and Protein Films, 1340
Elliott, Charles : Awarded third prize by the British Association for the Advancement of Science for the 1957 *Endeavour* Prize Competition, 529
Elliott, G. : Oxygen as a Donor Element in Germanium, 1350
Elliott, G. A. : Some Recent Advances in Spectroscopy, *erratum*, 122
Elliott, G. F., and others : Paramyosin Elements in Lamellibranch Muscles, 1291
Ellis, G. C. : Materials for Nuclear Engineering (Physical Properties of Beryllium), 469
Ellis, M E., and others · Chromatographic Characterization of Soluble Deoxypolynucleotides released in Mouse Spleen by X-Irradiation, 1285
Ellis, S. K. F., and others · An Inherent Character of Plant Species of Drier Habitats, 698
Ellis, Dr. S R. M. : Appointed to the second chair in the Chemical Engineering Department of the University of Birmingham, 465 ; work of, 465
Ellison, Dr. M. A : A Solar 'Blow-Off' Prominence, 589
  Popularizing the International Geophysical Year, *review*, 623
  Recent Solar Activity, 1173
Elmes, P. C. (White, J. C., and), and others : A Lattice Distortion of Alkali Chloride Crystals in the presence of Nucleoprotein Microfibrils 696
Elminius modestus Darwin in Ireland : Occurrence of (D M. Beard), 1145
Elongation of Pea Stems · Relationship between Shoot Apex and Effect of Gibberellic Acid on (A. J. Vlitos and W Meudt), 284
Elsasser, Prof. Walter M. : Magnetohydrodynamics, *review*, 935
Elsden, Dr. S. R. : Photosynthesis (The Photosynthetic Bacteria), 1084
Elton, Charles : Interspecific Competition, 1002
Embryo (Chick) : Teratogenic Effects of Beta-Amino-Propionitrile in the (Ellis E. Rosenberg), 706
Embryology (Conifer) : Aspects and Problems of (Prof. J. Doyle), 48
Embryonic Chick Bones : Cultivation of, on Chemically Defined Media (Dr. J. D. Biggers, Dr. M. Webb, and Dr. Raymond C. Parker and George M. Healy), 825
Embryos (Young Chick) : Absence of Wound Healing in (Prof. Paul Weiss and A. Gedeon Matoltsy), 854
Emeleus, K. G , and Love, B. : Ionization Phenomena in Gases (Phenomena involved in the Classification and Stability of Striations), 792
Emergence from the Puparium : A Method of Marking Calliphoridae (Diptera) during (K. R. Norris), 1002
Emerson, S. J. : Safety in the Chemical Industry (Safety in the Use of Electricity in the Chemical Industry), 1398
Emerson, Dr. W. W. : Organo-Clay Complexes, 48
Emerton, H. W : Fundamental Aspects of Fibres and their Treatment for Papermaking (Morphology of Pulp Fibres—Structure of the Outer Secondary Wall) 1176 ; (Process of Beating—Significance for Papermaking of the Outer Secondary Wall), 1177
Emmens, Prof. C. W , and others : Action of Gonadotrophins on the Ovary, 38
Emory University, Georgia : Appointment of Dr. G. H. Bourne as professor of anatomy, 169
Empire : H R H. the Duke of Edinburgh's Study Conference on the Human Problems of Industrial Communities within the Commonwealth and (Oxford, 1956), *review* by Dr. W. H. Scott, 876
Empire Cotton Growing Corporation : Progress Reports from Experiment Stations in Northern Nigeria for 1955-56, 315
Enamel (Dental) : Assessment of Mineral Content in Water-mounted Sections of (J H. Allan), 1130
Enamel (Human) : Mineralization of (J. H. Allan), 1362
Enamel (Powdered Dental) : Fluoride Removal by, from Solutions of Stannous or of Sodium Fluoride (Dr. Frank A Smith, Dwight E. Gardner, Dr. Samuel E Leach and Dr. Harold C Hodge), 1421
Enantiomorphs (Optical), of Methylpentynol : Narcotic Activity of (J. R. Hickman and Dr. P G. Marshall), 1053
Encouragement of the Arts, Humanities and Social Sciences : The Canada Council for the, 356
Encyclopedia of Chemical Reactions (compiled by Prof C. A. Jacobson), edited by Clifford A. Hampel, Vol. 6, Samarium, Scandium, Selenium, Silicon, Silver, Sodium, *review* by Prof. W. Wardlaw, 6
Encylopedia of Chemistry (edited by Prof. George L. Clark and Gessner G. Hawley), *review* by Prof. J. R. Partington, 569
End of the Rocket of the First Artificial Earth Satellite, 1392
Endeavour Prizes for the 1957 Essay Competition : Presentation of (British Association for the Advancement of Science), 529
Endocrine Glands of the Rat : Effect of Prolonged Administration of Reserpine on the (Prof O. Eranko, V. Hopsu, E. Kivalo and A. Telkka), 1130
Endocrinological Problems in Agriculture (Dr. I W Rowlands), 576
Endoglucuronidase : The Hyaluronidase of the Leech—an (Alfred Linker, Philip Hoffman and Karl Meyer), 810
Endothelial Lining of the Blood Sinusoids : Subendothelial Space between the Ovarian Interstitial Cell and the (Dr. M. De Groodt, A. Lagasse and Prof. M Sebruyns), 1431
Endross, L : High Polymer, Colloid and Surface Chemistry (Fractionation of Commercial Acetate Rayons in the System Phenol/cyclohexane), 961
Energetics in Biochemical Reactions : Some Principles of (Prof. Irving M. Klotz), *review* by Dr. Herbert Gutfreund, 207
Energy : Solar—a Challenge to the Future (Dr. Harold Heywood), 115
  The World's Requirements for (Proceedings of the International Conference on the Peaceful Uses of Atomic Energy, Geneva, 1955, Vol. 1), *review* by Dr. T. E. Allibone, 254
Energy (The Free), of Hydrolysis of Adenosine Triphosphoric Acid (G. E. Vladimirov, V. G. Vlassova, A. Y. Kolotilova, S. N. Lyzlova and N. S Pantereyeva), *erratum*, 363
Energy (Group Localization), and Polarographic Half-wave Potentials of Aromatic Nitro Compounds (Dr. Sadhan Basu and Jayanti Nag Chaudhuri), 1473
Energy (Stellar), and Stellar Evolution (Prof. T. G. Cowling), 479
Energy for Growth ? : How does the Ehrlich Ascites Tumour obtain its (A. Kemp and Prof B. Mendel), 131

Energy (*Para*-Localization), (Free-Electron Molecular Orbital) and Polarographic Half-Wave Potential of some Polynuclear Hydrocarbons (Sadhan Basu and Rama Bhattacharya), 143
Energy Transfer in Polyacene Solid Solutions (F. R Lipsett), 786
Engel, Dr. J H : Operational Research (Use of Clustering in Mineralogical and other Surveys), 1088
Engineering : Communication (Dr W L Everitt and Prof. G. E. Anner), third edition, *review* by Prof. James Greig, 1080
  Frequency Modulation (Christopher E. Tibbs and G. G. Johnstone), second edition, *review* by Dr R. L Smith-Rose, 206
  Russian—English Glossary of Nuclear Physics and (Consultants Bureau, Inc), *review* by J B Sykes, 569
  Scholarships in (Hoover, Ltd.), 738
Engineering Training in the B.B.C. (Dr. K. R Scurley), 537
Engineering (Chemical), at Birmingham, 465
Engineering (Chemical) Solid Systems in, *review* by Prof J. M. Coulson, 823
Engineering (*Chemical*), *Canadian Journal of* (Chemical Institute of Canada), 19
Engineering (Chemical) Education (Symposium at the University of Birmingham), 125
Engineering (Chemical) Practice (edited by Herbert W. Cremer and Trefor Davies), Vol. 3, Solid Systems, *review* by Prof. J. M. Coulson, 823
Engineering (Civil), in Trinity College, Dublin, 464
Engineering (Electrical), at Queen's University, Belfast, 1168
Engineering (Electrical), at the University of Sheffield—New Laboratories, 414
Engineering (Electrical) : Tensors in (Extra-Mural Department of the University of Liverpool Residential Course on), 369
Engineering (Foundation) : Soil Mechanics and—Fourth International Conference (D. J Maclean), 839
Engineering (Foundation), International Society of Soil Mechanics and . Fourth Conference, 270, 839
  Election of Prof. A. W Skempton as president, 840
Engineering (Nuclear) : Materials for (Physical Society Conference on), 468
Engineering Industry : Education and Training for the (Sir David Anderson), 482
Engineering Work (Scientific and) : Digital Calculating Machines and their Application to (G. A. Montgomerie), *review* by Dr. A. D. Booth, 823
Engineering and Industrial Science · Records and Research in (Dr J Edwin Holmstrom), third edition, *review* by R. Brightman, 453
Engineering and Physical Sciences Ordinary Non-Linear Differential Equations in (Prof. N. W. McLachlan), second edition, *review* by Dr. L. S. Goddard, 58
Engineers Awards for, in 1958 (Whitworth Foundation), 1453
  Training Overseas, in Britain, 635
Engineers (Chemical), Institution of . Joined to the European Federation of Chemical Engineering, 953
Engineers (Chemical), Institution of (Low Temperature Group of the Physical Society and the) . Conference on Recent Developments in Industrial Low Temperature Gas Separation, 270, 1028
Engineers (Civil), Institution of : James Forrest Lecture (Dr. R. v. d. R. Woolley), 420
  Election of Officers for 1957-58, 531
  Lectures on the Conservation of Natural Resources, 687
Engineers (Electrical) : The *j* Operator for (Philip Kemp), *review* by Prof. A. Tustin, 1263
Engineers (Electrical), Institution of : Election of Officers, 72
  Presidential Address (T. E Goldup), 784
Engineers (Electrical), Institution of (Radio and Telecommunication Section) : Discussion on Radio Observations on the Russian Satellite, 953
Engineers (Mechanical), Institution of : Conference on Lubrication and Wear, 531, 1448
  Conference on Properties of Materials at High Rates of Strain, 584
Engineers (Radio), British Institution of : Convention on Electronics in Automation, 369
  Clerk Maxwell Premium awarded to Dr. K D. Froome, 529
  Heinrich Hertz Premium awarded to Dr. A. G. Edwards, 529
  Brabazon Premium awarded to K. E. Harris, 529
  Louis Sterling Premium awarded to Dr. A van Weel, 529
  Marconi Premium awarded to Prof P M. Honnell, 530
  Dr. Norman Partridge Memorial Award awarded to H. J Leak, 530
England . Tornadoes in, May 21, 1950 (H. H. Lamb), 966
England (North of) Further Education in the, 1323
England (Rural), Council for the Preservation of : Eighteenth National Conference for the Preservation of the Countryside (Rural Problems of the Moment), 531
  Work of the, 636
English Place-Name Elements (A. H Smith), Part 1, Introduction Bibliography, the Elements A-IW, Maps ; Part 2, The Elements Jafn-Ytri, Index and Maps, *review* by Prof. H. C Darby, 106
English Transactions of Russian Medical and Biological Journals : Publication of (Pergamon Institute), 466
Enhancement of Mouse-virulence of Group *A* Streptococci (J. Cameron), 1136
Enhancement of Vitamin B_{12} Absorption by Substances other than Intrinsic Factor (Samuel M Greenberg, John F Herndon, Edward G. Rice, Edwin T. Parmelee, John J Gulesich and Edward J. Van Loon), 1401
Enhancement (Auroral), of Infra-red Radiation emitted by Atmospheric Ozone : A Possible (Wallace B Murcray), 139
Enigmonia aenigmatica Sowerby, a Motile Anomiid (Saddle Oyster), (Prof. C. M. Yonge), 765
Enquiries (Administrative Tribunals and) : Report of the Committee on, 819
  House of Commons Debate on, 1178
Entrance Exhibitions (Trinity College, Cambridge), 1239
Entrikin, Prof. John B. (Cheronis, Prof. Nicholas D., and) : Semimicro Qualitative Organic Analysis, second edition, *review* by Dr. W. J. Hickinbottom, 567
Entry of Radioactive Strontium into Plants from Soil . Rate of (Dr R. Scott Russell and G M Milbourn), 322
Enzymatic Technique (Post-chromatographic) · Detection of the Substrate of Enzymic Browning in Cacao by a (Dr. L. A. Griffiths), 1373
Enzymatic Transmethylations : Selenomethionine in (Dr. S. Harvey Mudd and Dr. G. L. Cantoni), 1052
Enzyme (Old Yellow) : Effect of Flavin Monosulphate on (Prof Hugo Theorell, Kunio Yagi, George D. Ludwig and Fujio Egami), 922
Enzyme (True- and Pseudo-) · Insensitivity of Chicken Cholinesterase to Specific Inhibitors of (Prof. W. Ferrari), 144
Enzyme Research : Some Modern Aspects of, *review* by Prof. D D. Woods, 1379
Enzymes—Units of Biological Structure and Function (edited by Oliver H. Gaebler), *review* by Prof. D. D Woods, 1379
Enzymes in *Neurospora* · Effects of Molybdenum and Copper on some (K. Commissiong and Dr. D. J. D Nicholas), 555
Enzymes (Autolytic) . Bacterial Protoplasts from *Bacillus* Species by the Action of (F. A. Dark and R. E. Strange), 759
Enzymes (Inducible) . Simultaneous Synthesis of Two, in *Staphylococcus aureus* (Prof. H. H. Ramsey and T E. Wilson), 761
Enzymes (Proteolytic) : Coagulant Action of (Dr. Herbert M. Rubinstein), 1202
Enzymic Browning in Cacao : Detection of the Substrate of, by a Post-chromatographic Enzymatic Technique (Dr. L. A Griffiths), 1373
Enzymic Degradation (Partial), of *Tamarindus*-Amyloid (Dr. P. Kooiman), 201
Epiphyseal Cartilage Homogenate : Glucuronic Acid Formation in (Alessandro A. Castellani, Benedetto de Bernard and Vittorio Zambotti), 859
Epithelium of the Œsophagus : Mast Cells in the (Dr. F R. Johnson and R. M H. McMinn), 615
Epithelium (Outer Mantle), of *Arca noae* : Mucous Gland Cells of the (E R Trueman), 1492
Epstein, Dr A L · Tribal Government, *review*, 1442
Epstein, B , and Shapiro, B. : Intestinal Lecithinase, 387
Equations : Differential, *review* by Dr. L. S. Goddard, 58
  Differential (S V. Fagg), *review* by Dr L S. Goddard, 58
  Differential (Prof. Harry W. Reddick and Prof. Donald E. Kibbey), third edition, *review* by Dr. L. S. Goddard, 58
  Elementary Differential (William Ted Martin and Eric Reissner), *review* by Dr. L S Goddard, 58
  Ordinary Non-Linear Differential, in Engineering and Physical Sciences (Prof. N. W McLachlan), second edition, *review* by Dr L. S. Goddard, 58
  Partial Differential (Transactions of the Symposium held at the University of California, 1955, on), *review* by Dr. L. S. Goddard, 58
  Partial Differential (Prof. G. F. D. Duff), *review* by Dr. L. S. Goddard, 58
Equator (Magnetic) . Variation of the Horizontal Force near the (Prof. N. S. Alexander and C. A. Onwumechilli), 191
Eränko, Prof O., and others : Effect of Prolonged Administration of Reserpine on the Endocrine Glands of the Rat, 1130
Erdtman, Prof H. : Recent Advances in the Chemistry of Terpenoid Compounds (Possible Uses of Chemical Constituents in Taxonomy), 471
Ergot in Gramineae (W P Campbell), 315
Ericales · Unisexual Flowers in the (E. J Godley), 284
Ericson, L. G., and Tomlin, Dr S. G · High Polymer, Colloid and Surface Chemistry (Study of Collagen by means of Low-angle X-ray Diffraction), 961
Erinaceus europaeus (Hedgehog) : Susceptibility of the, to Infection with *Leptospira pomona* (Dr. W. Maurice Webster), 1372
Error (A Significant), in the Determination at Low Pressures of the Virial Coefficients of Vapours (Prof. R. Whytlaw-Gray and Dr. G. A. Bottomley), 1252
Erskine, R. G. · Appointed temporary veterinary research officer, Federation of Nigeria, 1098
Eruption Sequence (Tooth), in Fossil and Recent Man (Dr. Stanley M. Garn and Dr. Kalevi Koski), 442
Erythrocytes in Severe Scurvy . Ultrastructure of (Prof. Bruno Kisch and Gustav J Martin), 812
Erythrocytes (Dog) : Genetically-controlled Differences in Catalase Activity of (Dr. A C. Allison and W. ap Rees , and G. P Burn), 649
Erythrocytes (Foreign) : Induction of Immunological Tolerance in Rats to (Dr G. J V. Nossal), 1427
Erythrocytes (Human) Fractionation of, on the Basis of their Age (Ernest R. Simon and Yale J. Topper), 1211
Erythromycin Toxicity of (Colonel W. D. Tigertt and W. S. Gochenour, Jun.), 1429
Escherichia coli : Protoplasts of, as Sources and Acceptors of Deoxypentose Nucleic Acid—Rehabilitation of a Deficient Mutant (Prof. Erwin Chargaff, Herbert M. Schulman and Dr. Herman S Shapiro), 851
Escherichia coli B and *Escherichia coli* B/r · Colonial Differentiation between (Prof. Leonard N Zimmerman), 1217
Escherichia coli *K*-12 Acriflavine as an Effective Agent for Eliminating *F*-Factor in (Yukinori Hirota and Teiji Iijima), 655
Eselson, B. N. · Low-Temperature Physics (Lambda Points of Mixtures of Helium-3 and Helium-4), 460
Eskimoid People : The Aleut Dentition—a Correlative Study of Dental Characteristics of an (Dr. Coenraad F. A. Moorrees), *review* by F Taylor Monks, 1380
Essayist of the British Countryside, *review* by Sir John Russell, 1257
Essen, Dr. L. : The Units of Time and Length, 137
  The Clock Paradox of Relativity, 1061
Essen, Dr. L , and others : Comparison of Caesium Resonators by Transatlantic Radio Transmission, 526
Esters (Choline) : Muscarinic Action of Murexine and some related (Dr. Martin M Winbury), 988
Esters (Organic Phosphate) · Changes of, during Glycolysis of Blood followed by a Paper Chromatography Method (Dr. L. Macho), 1351
Estimating the Life of a Satellite (J M C Scott), 1467
Estimation (Colorimetric), of Manganese (W. V Single), 250
Estimation (Quantitative), of Graphite in Refractory Carbon Deposits by X-Ray Technique (Prof William A. Fred and Dr. Paul G. Herold), 1273
Estimation (Rapid), of the Areas of the Leaves of Crop Plants (Dr P. C. Owen), 611
Ethology and Comparative Psychology (Conference at the Center for Advanced Study in the Behavioral Sciences, Stanford, California), 362
Ethyl Acetate : Rapid Extraction with, of Free Fluorescein Derivatives from Fluorescein *iso*Cyanate-Globulin Conjugates (Dr. J. K. Dineen and G. L. Ada), 1284

Ethyl-3-Indoleacetate—an Artefact in Extracts of Immature Corn Kernels (Henry N. Fukui, JoAnne E. DeVries, S. H. Wittwer and Prof. H. M. Sell), 1205
Ethyl Trichloracetate : Lipotropic Action of (Dr. C. C. Kratzing and Dr. G. M. Windrum), 859
Ethylene Dibromide : Action of, on Hen Gonadotrophic Hormones (Dr. Eugenia Olomucki), 1358
Ethylenediaminetetra-acetic Acid : Application of, in the Isolation of Crustacean Chitin (Dr. A B. Foster and R. H. Hackman), 40
  Dwarf *Drosophila* produced by—a Relationship to Chelation of Zinc (Dale Steffensen), 390
Etiology and Pathogenesis of Arteriosclerosis (Prof. G. Lyman Duff), 267
Ettinger, Dr. G. H : Our Debt to the Future (The Penalties of Ignorance of Man's Biological Dependence), 259
Eugenics Society : Jubilee Dinner, 1461
  Presentation of the Galton Medal to Dr. C P. Blacker, 1461
  Issue of a revised Statement of Aims, 1461
  Appointment of Dr. G. C. L. Bertram as general secretary, 1461
Europe : Designs for (Political and Economic Planning, Broadsheet No. 414), 965
Europe and in the United States : Air and Water Pollution—the Position in (European Productivity Agency of the Organization for European Economic Co-operation, Project Nos. 136 and 145), *review* by Dr. A Parker, 451
European Baccalaureate Diploma (To be awarded by the European School in Luxembourg), 686
European Badger (John Sankey), 421
European Contact Group : Report of the First Meeting on the Uses of Isotopes and Radiation in Agricultural Research, Wageningen, 1956 (Food and Agriculture Organization of the United Nations), 275
European Countries : University Interchange between the United Kingdom and other (1948-56), (British Council), 170
European Economic Co-operation, Organization for (European Productivity Agency of the) : Project Nos. 136 and 145, Air and Water Pollution—the Position in Europe and in the United States, *review* by Dr. A. Parker, 451
  The Training of Workers within the Factory, 537
  Report on Labour Management on the Farm, 1461
European Federation of Chemical Engineering : Joined by the Institution of Chemical Engineers, 953
European Foul Brood—a Disease of the Larval Honeybee (*Apis mellifera* L.) caused by a Combination of *Streptococcus pluton* (*Bacillus pluton* White) and *Bacterium eurydice* White (L Bailey), 1214
European Free Trade Area : The Balance-of-Payments Problems of a (Prof. J. E. Meade), 481
European Productivity Agency of the Organization for European Economic Co-operation : Project Nos. 136 and 145, Air and Water Pollution—the Position in Europe and in the United States, *review* by Dr. A. Parker, 451
  The Training of Workers within the Factory, 537
  Report on Labour Management on the Farm, 1461
European School in Luxembourg : To award a European Baccalaureate Diploma, 686
European (Western) Co-operation, 965
European and Indigenous Cattle in the Tropics : A Difference in the Physiology of the Large Intestine between (Dr. J. Quarterman, G. D. Phillips and G H. Lampkin), 552
Evaluation of Wheat Quality : Role of Damaged Starch in the (L. H. Bird), 815
Evans, Prof. A. G : Solvent Effects and Reaction Mechanism, 535
Evans, B. L. : Initiation and Growth of Explosion in Solids (Structure and Stability of Inorganic Azides), 74 ; (Initiation by Light), 74
Evans, B. L., and others · Foreign Cations in Silver Azide, 294
Evans, Dr. D. G. : Non-specific Immunity (Immunity produced in Mice by Intraperitoneal Injection of Pertussis Vaccine against the Intracerebral Challenge of Living Virulent Organisms), 641
Evans, Dr. D. H L., and Schild, Dr. H. O. : Mechanism of Contraction of Smooth Muscle by Drugs, 341
Evans, J. I., and Yuill, Dr. A. M. : Initiation and Growth of Explosion in Solids (Ignition of Explosive Materials by the Compression of Gas Spaces), 73
Evans, J. V. : Water Metabolism in the Sheep, 756
Evans, Dr. R. C. : Appointed principal of the University College of North Wales, 529 ; work of, 529
Evans, Dr. R. L : Red-Cell Survival in Familial Haemolytic Anaemias, 1435
Evans, Dr. R. L., and others · Occurrence of Gamma-Guanidinobutyric Acid, 704
Evans, Dr. S. : Awarded the Polar Medal, 18
Evans, W. E. · Appointed geologist, Cyprus, 413
Evans, Dr. W. M : Promoted to Deputy Chief Scientific Officer in the Scientific Civil Service, 638 ; work of, 638
Evaporated Barium Films : Reaction of Carbon Monoxide with (R. N. Bloomer), 249
Evaporation from Grass and Vegetables (N. E. Rider), 20
Evenari, Prof. Michael, and others : Action of Blue Light on the Germination of Seeds, 609
Everett, J. W. (Nikitovitch-Winer, M., and) : Resumption of Gonadotrophic Function in Pituitary Grafts following Retransplantation from Kidney to Median Eminence, 1434
Everitt, Dr. W. L., and Anner, Prof. G. E. : Communication Engineering, third edition, *review* by Prof. James Greig, 1080
Everlasting Hills (Prof. David L. Linton), 481
Everyman's Parasitology, *review* by Dr. C. A. Hoare, 1079
Eveson, Dr. G. F. : Rheology of Disperse Systems, 958
Evidence relating to the Earth's Inner Core from Hydrogen Bomb Explosions in 1954 (Prof. K. E. Bullen and T. N. Burke-Gaffney), 49
Evidence for the Formation of a Labile Phospholipoprotein during the Clotting of Platelet-rich Plasma (Dr. G. V. R. Born), 546
Evidence from Moiré Patterns of Packing Faults in Boron Nitride Crystals (Dr J. F. Goodman), 425
Evidence of a Second Foetal Haemoglobin in the Newborn Goat (Dr. T. H. J. Huisman, H. K. A. Visser and H. J. van der Helm), 758
Evidence (Experimental), for an Allergic Basis for Granuloma Formation in Man (Dr. Walter B. Shelley and Dr. Harry J. Hurley), 1060
Evidence (Field), of Density-governing Reaction in *Sminthurus viridis* (L.), (M. M. H. Wallace), 388
Evolution of Organization in the Nervous System (Prof. J. Z. Young), 480
Evolution (Mosaic), in Hydroids (Dr J. E. Morton), 130
Evolution (Stellar) : Stellar Energy and (Prof. T. G. Cowling), 479
Evolution and Theology, *review* by the Rev. Dr. E. L. Mascall, 671
Evolutionary Process : The Three Types of (Dr. Julian Huxley), 454
Evolutionary Relationship (Probable), of Serotonin and Indoleacetic Acid, and some Practical Consequences Therefrom (Dr. D. W. Woolley), 630
Evolutionary Theory and Christian Belief (Dr. David Lack), *review* by the Rev. Dr. E. L. Mascall, 671
Evolutionary Trends in the Classification of Capitate Hydroids and Medusae (Dr. William J. Rees), 130
Ewer, R. F. : Fossil Seed Material recovered from the Florisbad Deposit, 1393
Examination (Chemical), of the Water of Flooded Rice Fields (R. Vámos), 1484
Excavations at Chupicuaro, Guanajuato, Mexico (Muriel Porter), 636
Excess Volumes in Binary Liquid Mixtures of Simple Molecules (R. A. H. Pool and L. A. K. Staveley), 1118
Excess Zinc in Zinc Oxide (H. J. Allsopp and J. P. Roberts), 603
Exchange Lectureships : Perkin, 787
Exchange Scholarships in Medical Science : French (Medical Research Council Awards for 1957-58), 315
Excitation of Molecular Spectra by Shock Waves (J. G. Clouston and Dr. A. G. Gaydon), 1342
Excited Levels in Arsenic-75 produced by Radiative Capture of Protons by Germanium-74 (D. R. Chick and S. E. Hunt), 88
Excited Oxygen Molecules (Vibrationally) · Production of, in the Flash Photolysis of Ozone (W. D. McGrath and Prof R. G. W. Norrish), 1272
Excretion of Yttrium and Lanthanum Chelates of *Cyclohexane* 1,2-*Trans* Diamine Tetraacetic Acid and Diethylenetriamine Pentaacetic Acid in Man (Dr. Harry Kroll, Dr. Samuel Korman, Dr. Elsie Siegel, Dr. Hiram E. Hart, Dr. Betty Rosoff, Dr. Herta Spencer and Dr. Daniel Laszlo), 919
Excretion (Urinary Œstrogen), by the Bull (Weert Velle), 856
Executives : Promotion and Pay for (Dr. George Copeman), *review* by E. F L. Brech, 1153
Executives in Industry, *review* by E. F. L. Brech, 1153
Exhibition : Brussels Universal and International (1958), 1322
Exhibition of Laboratory Apparatus and Techniques (Manchester College of Science and Technology), 1239
Exhibition of Nature Photography (Royal Photographic Society), 892
Exhibition of New University Architecture at the University of London (University Architecture Exhibitions Committee and the Arts Council of Great Britain), 891
Exhibitions : Entrance (Trinity College, Cambridge), 1239
  Trade Fairs and (Political and Economic Planning, Broadsheet No. 411), 361
Expedition (British North Greenland) : High Arctic—the Story of the (Mike Banks), *review* by Sir Raymond Priestley, 1258
Expedition (Modern Arctic) . Sidelight on a, *review* by Sir Raymond Priestley, 1258
Expenditure · Domestic Food Consumption and (1955)—Annual Report of the National Food Survey Committee (Ministry of Agriculture, Fisheries and Food), 587
Expenditure (Public), on Scientific Projects · Control of, 695
Experiment on Air Showers produced by High-Energy Cosmic Rays (Dr. G. Clark, Dr. J. Earl, Dr. W. Kraushaar, Dr. J. Linsley, Dr. B. Rossi and Dr. F. Scherb), 353, 406
Experiment on 'Telepathy' using Television : An (Donald Michie and D. J West), 1402
Experimental Attempt to Determine the Site of the Neurohypophysial Osmoreceptors in the Dog (P. A. Jewell and Prof. E. B. Verney), 129
Experimental Biliary Obstruction : Effect of, on the Phagocytic Activity of the Reticulo-Endothelial System (B. N. Halpern, G. Biozzi, Prof. T. Nicol and D. L J. Bilbey), 503
Experimental Chronic Fluorosis · A Lipid Material in Bone and Teeth in (Gertrud Lindemann), 926
Experimental Evidence for an Allergic Basis for Granuloma Formation in Man (Dr. Walter B. Shelley and Dr. Harry J. Hurley), 1060
Experimental Induction of the Breeding Season in a Xerophilous Bird (Dr. A. J. Marshall and H. J. de S. Disney), 647
Experimental Inflammatory Œdema in Rats : Attempt to Transplant the Œdema Fluid of (Dr. E. Kelemen), 710
Experimental Leukaemia : Silvina Estrada de Acevedo Fellowship for Research in, 530
Experimental Nephrocalcinosis : Sensitization by Œstradiol to the Production of (Prof. H. Selye), 1420
Experimental Physical Chemistry (Prof. Farrington Daniels, Prof. Joseph Howard Mathews, Prof. John Warren Williams, Prof. Paul Bender and Prof. Robert A. Alberty), fifth edition, *review* by Dr. E. F. G. Herington, 209
Experimental Proton Linear Accelerator using a Helical Waveguide (D. R. Chick, D. P. R Petrie, D G. Keith-Walker and H. Longley), 432
Experimental Studies of Mimicry in some North American Butterflies (Mrs. Jane Van Zandt Brower), 444
Experimental Thermochemistry—Measurement of Heats of Reaction (edited by Frederick D. Rossini), *review* by Dr. E. F. G. Herington, 57
Experimental and Clinical Diabetes : The Effects of the Sulphonylureas and related Compounds in (New York Academy of Sciences Conference on), 584
Experiments in Chemistry : Lecture (G Fowles), fourth edition, *review* by A. C. Cavell, 878
Exploration of the Deep Ocean Floor (British Association for the Advancement of Science, Section A (Mathematics and Physics), Discussion on), 778
Exploration in South Africa : Swedish, *review* by Prof O Lowenstein, 56
Explosion in Solids . Initiation and Growth of (Royal Society Discussion on), 73
Explosions (Atomic), in Australia : Seismic Recordings of (H. A. Doyle), 132
Explosions (Hydrogen Bomb), in 1954 : Evidence relating to the Earth's Inner Core from (Prof. K. E. Bullen and T. N. Burke-Gaffney), 49
Exposure to Gamma-Rays : Effect of, on the Hygroscopicity of Sitka Spruce Wood (J. M Paton and R. F. S. Hearmon), 651

Exposure to Light : Decrease in Fluorescence Intensity of a Solution of Fresh Cigarette Smoke Products on (Hilda Johnston), 1350
Expression of Sex in Flowering Plants (Prof H. G. Baker), 614
Exteroceptive Factors : Effect of, on the Œstrous Cycle of Mice (W. K. Whitten), 1436
Extraction (Rapid), with Ethyl Acetate of Free Fluorescein Derivatives from Fluorescein *iso*Cyanate-Globulin Conjugates (Dr. J. K. Dineen and G. L. Ada), 1284
Extraction and Refining of the Rarer Metals (Proceedings of a Symposium on Extraction Metallurgy of some of the Less Common Metals arranged by the Institution of Mining and Metallurgy, London, 1956), *review* by A. R. Bailey, 258
Extraction Metallurgy at the Imperial College, 18
Extracts of Immature Corn Kernels : Ethyl-3-Indoleacetate—an Artefact in (Henry N. Fukui, JoAnne E. DeVries, S. H. Wittwer and Prof. H. M. Sell), 1205
Extreme Resolution : Microphotography—Photography at (Dr. G. W. W. Stevens), *review* by Dr. R. Barer, 622
Extrusion (Monthly), of Unfertilized Eggs : Hermaphroditism with Self-Fertilization and the, in the Viviparous Fish *Lebistes reticulatus* (Dr. H. Spurway), 1248
Exudates from Living Seedlings : Germination of Oospores of *Pythium mamillatum* in Response to (Richard Barton), 613
Eyers, J. : Safety in the Chemical Industry (History of Engineering Inspection since the 1850's), 1399
Eyring, Prof. H. (Parlin, Dr. R. B., and) : Initiation and Growth of Explosion in Solids (Some Kinetic Problems of Fast Reactions), 74

FABRICS (Apparel) : Flammability of, in relation to Domestic Burning Accidents (British Standards Institution), 1102
Factor in the Rhizosphere Phenomenon · Fungistasis as a (R. M. Jackson), 96
F-Factor in *Escherichia coli K*-12 : Acriflavine as an Effective Agent for eliminating (Yukinori Hirota and Teiji Iijima), 655
actor (A Highly Specific Growth-Inhibitory), produced by certain *Acetobacter* Species (Dr. Robert Steel and Prof. Thomas K. Walker), 811
Factor (An Unsuspected), which influences Consumption of Alcohol by Rats (R. J. G. Gillespie and Prof C. C. Lucas), 1292
Factor Table for the First Ten Millions, containing the Smallest Factor of Every Number not Divisible by 2, 3, 5 or 7 between the Limits 0 and 10,017,000 (Derrick Norman Lehmer), *review* by Dr. J. C. P. Miller, 520
Factors : Primes and, *review* by Dr. J. C. P., Miller, 520
Factory : The Training of Workers within the (European Productivity Agency of the Organization for European Economic Co-operation), 537
Faecal End-Products of Cholesterol Metabolism : Effect of Different Dietary Fats on the (H. Gordon, B Lewis, L. Eales and Prof. J. F. Brock), 923
Fagara xanthoxyloides · The Gum of (Dr. F. G. Torto), 864
Fagg, B. E. B. : Appointed director, Department of Antiquities, Federation of Nigeria, 1454
Fagg, S. V. : Differential Equations, *review* by Dr. L. S. Goddard, 58
Fahmy, Dr. Myrtle J. (Fahmy, Dr. O G., and) : Mutagenic Response to the Alkyl-Methanesulphonates during Spermatogenesis in *Drosophila melanogaster*, 31
Fahmy, Dr. O. G., and Fahmy, Dr. Myrtle J. : Mutagenic Response to the Alkyl-Methanesulphonates during Spermatogenesis in *Drosophila melanogaster*, 31
Failure of Neuromuscular Transmission : Adrenaline and (K. Krnjević and R. Miledi), 814
Fairley, Sir Neil Hamilton : Awarded the Buchanan Medal for 1957 of the Royal Society, 1025, 1232 ; work of, 1232
Fairs and Exhibitions : Trade (Political and Economic Planning, Broadsheet No. 411), 361
Faith (Christian), and the Freedom of Science (Dr. R. Hooykaas), 71
Fajer, A. : Effects of Methylene Blue added to a Low Fat Diet in the Mouse, 1054
Falconer, Dr. R. : Quality Control of Food (Control Charts in the Baking Industry), 1327
Falkland Islands Dependencies Survey : Annual Relief Voyage of R.R.S. *John Biscoe* to the, 837
Fall-out : Monitoring Radioactive, 952
Faller, A. : The Abyssal Circulation of the Ocean, 734
Falling-Rate Period : Mechanism of Drying of Thick Porous Bodies during the (Prof. A. H. Nissan and W. G Kaye), 142
Familial Haemolytic Anaemias : Red-Cell Survival in (Dr Robert L. Evans), 1435
Fänge, Dr. Ragnar · An Acetylcholine-like Salivary Poison in the Marine Gastropod *Neptunea antiqua*, 196
Fantl, Dr. P., and Marr, A. G. M. : Phenols as Inhibitors of the Heparin Co-factor of Plasma, 990
Far-Red Radiation (Red and) : Effects of, on Seed Germination (Avishag Kadman-Zahavi), 996
Faraday Society : Discussion on Interaction in Ionic Solutions, 172
  Bourke Lectures (Prof W Jost), 838
Farley, Dr. F. J. M. : Elements of Pulse Circuits, *review* by Dr. R. L. Smith-Rose, 401
Farm : Field and (Richard Jefferies), edited with an Introduction and Notes by Samuel J. Looker, *review* by Sir John Russell, 1257
  Labour Management on the (European Productivity Agency of the Organization for European Economic Co-operation Report), 1461
Farm Soils (Prof. Edmund L. Worthen and Prof. Samuel R. Aldrich), fifth edition, *review* by Dr. A. M. Smith, 3
Farmilo, Dr. Charles G. (Tatt, Dr. Lee Kum, and) : Determination of Papaverine and Narcotine by using Ammonium Reineckate, 1288
Farnsworth, C. D. : Visual Problems of Colour (Importance for Colour Perception of the Time during which the Retina is exposed to a Particular Pattern of Stimulation), 1397
Farnsworth, Comdr. Dean : Exploration of the Deep Ocean Floor, 779
Farrer, K. T. H., and others : An Investigation of an Action of Penicillin, 657
Fat to Carbohydrate in Castor Beans : A Mechanism of Conversion of (H. L. Kornberg and H. Beevers), 35
Fat Diet (Low), in the Mouse : Effects of Methylene Blue added to a (A. Fajer) 1054
Fate of Lymphocytes : Behaviour and (Ciba Foundation Study Group Discussion on), 1016
Fats (Different Dietary) · Effect of, on the Faecal End-Products of Cholesterol Metabolism (H. Gordon, B. Lewis, L. Eales and Prof. J. F. Brock), 923
Fatt, Dr. P. : Chemical Transmission at Nerve Endings (Inhibition by a Chemical Transmitter), 628
Fauna of the Soil : International Group for the Study of the, 218
Fawley Foundation Lecture : Fourth (Sir George Thomson), 1223
Fay, Dr. J. W J : The National Coal Board's Pneumoconiosis Field Research, 309
Fazakerley, H., and others : Recent Advances in the Chemistry of Terpenoid Compounds (Chemistry of Hydroxyhopanone), 471
Feast, M. W. : Variable Stars in the Magellanic Clouds, 229
Federal Government : Science in the—a History of Policies and Activities to 1940 (A. Hunter Dupree), *review* by R. Brightman, 568
Federation of British Industries : Overseas Scholarship Scheme, 635
Federov, N. T. : Visual Problems of Colour (Standard Colour Theory), 1397
Feeding (Filter), and Food of Flamingoes (Phoenicopteri), (Penelope M. Jenkin) 128
Feeding Habits of a Marine Centipede (J. Gordon Blower), 560
Feelings (Bodily) : Pain and Pleasure, a Study of (Prof. Thomas S. Szasz), *review* by Dr. Clifford Allen, 936
Feeney, Prof. Robert E., and Bennett, Nelle : Formation of Liesegang-like Rings by Metal Ions and Chelating or Complexing Agents, 979
Fejer, J. A : Life-time of an Artificial Earth Satellite, 1413
Feldmann, J. : Systematics of To-day (Remarques sur la Systématique actuelle des Algues), 740
Feline Behaviour : Alterations in, following Bilateral Amygdalectomy (P. J. Morgane and Prof. A. J. Kosman), 598
Fell, B F., and others : Changes in the Intestinal Mucosa of the Sheep following Death by Humane Killer, 756
Fellenius, —. : Soil Mechanics and Foundation Engineering, 839
Fellgett, P. : Interference Spectroscopy, 956
Fellowship : Perkin Centenary, 787
Fellowship Awards in 1958-59 (National Science Foundation, Washington), 837
Fellowship for Advanced Research : Helen Putnam (Harvard University), 738
Fellowship in Astronomy (Robert Cormack Bequest) awarded to Miss Patricia R. R. Leslie by the Royal Society of Edinburgh, 122
Fellowship in Chemistry : Corday—Morgan Commonwealth (Chemical Society), 585
Fellowship in Medicine : Lederle Travelling (Medical Research Council Award for 1957-58), 315
Fellowship in Nutrition : Drummond Junior, awarded to J. F. D. Greenhalgh, 688
Fellowship in Physics : Post-doctorate (Dalhousie University), 1325
Fellowship for Research in Experimental Leukaemia : Silvina Estrada de Acevedo, 530
Fellowship in Tuberculosis : Dorothy Temple Cross Research (Medical Research Council Award for 1957-58), 315
Fellowship (Alan Johnston, Lawrence and Moseley Research), of the Royal Society awarded to Dr. P. C. Caldwell, 119
Fellowship (Stothert Research), of the Royal Society awarded to Dr. M. J. R. Dawkins, 119
Fellowships : American Studies (Commonwealth Fund, New York), 585
  Australian and New Zealand Civil Services (Commonwealth Fund, New York), 585
  Carlsberg-Wellcome Travelling (Carlsberg Foundation and the Wellcome Trustees Awards for 1957-58), 219
  Home Civil Service (Commonwealth Fund, New York), 585
  Journalism (Commonwealth Fund, New York), 585
  Lilly Foreign (Medical Research Council Awards for 1957-58), 315
  Overseas Civil Service (Commonwealth Fund, New York), 585
  Ramsay Memorial (Awards for 1957-58), 316
  Wellcome (Animal Health Trust Awards for 1957-58), 412
  Whitworth, 1453
Fellowships in Medicine : Rockefeller Travelling (Medical Research Council Awards for 1957-58), 315
Fellowships in Ophthalmology and Otology : Alexander Pigott Wernher Memorial Travelling (Medical Research Council Awards for 1957-58), 315
Fellowships for Postgraduate Research : British Oxygen (Awards), 270
Fellowships in Psychiatry and related Sciences : Research (Foundations' Fund for Research in Psychiatry), 953
Fellowships for Study and Travel in the United States (Commonwealth Fund, New York), 585
Feltham, K. S. : Appointed federal government chemist, Federation of Nigeria, 21
Feltham, Dr. P : Relaxation Spectrometry, *review*, 1269
Felton, H. R. : Gas Chromatography (Novel and Compact High-temperature Gas Chromatography Unit), 841
Female Larvae of the Potato-Root Eelworm (*Heterodera rostochiensis* Woll.) : Development of Isolated (T. D. Williams) 1000
Female Rat Preputial Gland : Purification of β-Glucuronidase from (Dr. G. A. Levvy and C. A. Marsh), 919
Feng, Dr. P. C. : Effect of Hypoglycin *A* on the Alpha Cells of the Pancreas, 855
Fennestad, K. L., and Borg-Petersen, C. : *Leptospira* Antibody Production by Bovine Foetuses, 1210
Fenton, Dr. A. G. : Given an award under the Royal Society and Nuffield Foundation Commonwealth Bursaries Scheme, 119
Ferguson, G. V. : Our Debt to the Future (Let us Look at our Human Resources), 260
Ferguson, Dr. J. K. W. : Our Debt to the Future (Let us Look at our Human Resources), 260
Fergusson, J. A. : Awarded a New Zealand Fellowship for 1957-58 by the Ramsay Memorial Trust, 316
Fermentation (Cider) : Chlorogenic Acid Metabolism in (Dr. G. C. Whiting and J G. Carr), 1479
Fermi Surface : The Band Theory of Metals and the Structure of the (Physical Society Conference on), 893, 1172
Fernandez, L. L. : Appointed assistant geologist, British Guiana, 1098

Ferrari, Prof. W. : Insensitivity of Chicken Cholinesterase to Specific Inhibitors of True- and Pseudo-Enzyme, 144
Ferret (*Putorius furo*) : Chromosome Number in the (O. Lande), 1213
Ferrets : Effect of Cerebral Lesions upon Œstrus in (J. Herbert and Sir Solly Zuckerman), 547
Ferrett, Dr. D. J. : Modern Analytical Chemistry in Industry (Use of Radioactive and Stable Isotopes in Industrial and Analytical Problems), 368
Ferrihaemoglobin Azide : Theory of Electron Resonance in (Binding in Haemoglobin Azide as determined by Electron Resonance), (J. S. Griffith), 30
Ferroelectric Material : A New (Bell Telephone Laboratories, New York), 19
Ferry, Prof. J. D. : Recent Advances in Gelatin and Glue Research (Chemical and Physical Properties of Gelatin and Glue), 690
Fertel, Mrs. A. M. : Bequest of more than £5,000 to the University of Bristol, to found one or more studentships for the furtherance of experimental research in physics, preferably in nuclear physics, 1171
Fertility : Studies on, including Papers read at the Conference of the Society for the Study of Fertility, Birmingham, 1955 (edited by Prof. R. G Harrison), *review*, 1267
Fertility, Society for the Study of : Seventh Annual Conference, 226
  First Oliver Bird Lecture (Dr. T. Mann), 1027
  Proceedings, Vol. 7, Studies on Fertility, including Papers read at the Conference at Birmingham, 1955 (edited by Prof. R. G. Harrison), *review*, 1267
Fertility and Fertility Control, 1027
Fertility (Soil), and Fertilizers (Samuel L. Tisdale and Werner L. Nelson), *review* by Dr. A. M. Smith, 3
Fertilizers : Soil Fertility and (Samuel L. Tisdale and Werner L. Nelson), *review* by Dr. A. M. Smith, 3
Festival of Films in the Service of Industry : Premier Award in the Films for Use in Schools Section won by 'Mirror in the Sky', 891
Festschrift : Stratton's, *review* by Prof. André Danjon, 1308
Feughelman, M., and others . Supercontraction of Wool irradiated with Ultra-violet Light or Iodinated, 1064
Fibres and their Treatment for Papermaking : Fundamental Aspects of (British Paper and Board Makers' Association Symposium on), 1175
Fibres (Cellulosic), in Contact with Rusting Iron : Degradation of (W. A. Bell and Jean M Gibson), 1065
Fibres (Paper-making) · Fundamental Research on (Dr. Julius Grant), 1175
Fibres (Two Inhibitory), forming Synapses with a Single Nerve Cell in the Lobster (Dr. A. S V. Burgen and Dr. S. W. Kuffler), 1490
Fibrous Peats and Moss Polsters : A Method for Concentrating Pollen Grains and Small Fossil Remains from (D. M. Churchill), 1437
Fibrous Proteins : Rapid Observation of Phase Transformation in, using an X-Ray Diffractometer (Dr. A R. B. Skertchly), 802
Ficq, A., and Pavan, C. : Autoradiography of Polytene Chromosomes of *Rhynchosciara angelae* at Different Stages of Larval Development, 983
Field, Dr. K. : Quantitative Chemical Analysis, *review*, 109
Field and Farm (Richard Jefferies), edited with an Introduction and Notes by Samuel J. Looker, *review* by Sir John Russell, 1257
Field Evidence of Density-governing Reaction in *Sminthurus viridis* (L.), (M. M. H. Wallace), 388
Field Studies Council : Retirement of the Rev. C. E. Raven from the presidency, 1028
  Lord Hurcomb to become president, 1028
  Courses for 1958, 1394
Fieldes, M., and Wells, N. : Trace Elements in Soils, Plants and Animals (Composition of Sweet Vernal Grass), 24
Fielding, J. : Given a Capper Pass Award of fifty guineas by the Institution of Mining and Metallurgy and the Institute of Metals, 361
Fields, Paul R., and others : Discovery of Element 102, 120
Fields (Flooded Rice) : Chemical Examination of the Water of (R. Vámos), 1484
Fieser, Louis F., and Fieser, Mary : Organic Chemistry, third edition, *review* by Prof. J. R. Partington, 352
Fieser, Mary (Fieser, Louis F., and) : Organic Chemistry, third edition, *review* by Prof. J. R. Partington, 352
Figueroa, Santiago, and others : Resistance of 9-α-Fluoro-11-β-Hydroxy-progesterone to Inactivation in the Liver of the Guinea Pig, 508
Films in the Service of Industry, Festival of : Premier Award in the Films for Use in Schools Section won by 'Mirror in the Sky', 891
Films (Interfacial) : Reaction of Globin with Haemin in (F. Haurowitz, M. Dicks and D. G. Therriault), 437
Films (Polymer) : Photochemistry of (Dr. G. S. Egerton and A. G. Roach), 189
Films (Polypeptide and Protein) : Optical Rotation and Infra-Red Spectra of some (Dr. A. Elliott, W. E. Hanby and B. R. Malcolm), 1340
Filter Feeding and Food of Flamingoes (Phoenicopteri), (Penelope M. Jenkin), 128
Filters (Membrane) : Variability in Retention of Marine Phytoplankton by (Dr. Reuben Lasker and Robert W. Holmes), 1295
Finance for Research on Wool, 170
Finch, R. M. : Use of Slag, Sewage, Refuse and Ash, and the Reclamation of Derelict Land, 687
Findlay, Prof. Alexander : Chemistry in the Service of Man, eighth edition, *review*, 774
Findlay, Dr. J. D. : Bioclimatology and Biometeorology (Bioclimatological Studies in Tropical Veterinary Medicine), 1328
Finlayson, Dr. L. H., and Walters, V. Ann : Abnormal Metamorphosis in Saturniid Moths infected by a Microsporidian, 713
Finney, Dr. D. J. : Probability, *review*, 1270
Finsen, Dr. W. S. : Appointed Union Astronomer at the Union Observatory, Johannesburg, 582 ; work of, 582
  Photographic Observations of Mars, 1392
Fireflies (*Photinus pallens*) : Dried Lanterns from (Medical Research Council Tropical Metabolism Research Unit, University College of the West Indies), 1454
First Artificial Earth Satellite : End of the Rocket of the, 1392
First Ten Millions : Factor Table for the ; containing the Smallest Factor of Every Number not Divisible by 2, 3, 5 or 7 between the Limits 0 to 10,017,000 (Derrick Norman Lehmer), *review* by Dr. J. C. P. Miller, 520
Fischer, Prof. Robert B. : Quantitative Chemical Analysis, *review* by G. Fowles, 676
Fischetti, B., and others : Action of Glucose-1-Phosphate on the Deposition of Phosphate in the Bones of Growing Diabetic Rats, 1357
Fish, J. C. : Activity and Specificity of Rennin, 345
Fish : Distribution of Strontium-90 in Pond Weed and (K. W. E. Bidwell and Eileen E. Foreman), 1195
Fish (Parrot), *Pseudoscarus guacamaia* : Occurrence of Periodic Acid—Schiff Positive Material in the Pituitary of the (Dr. A. J. Matty), 1055
Fish *Lebistes reticulatus* (Viviparous) : Hermaphroditism and Self-Fertilization, and the Monthly Extrusion of Unfertilized Eggs, in the (Dr. H. Spurway), 1248
Fish Larvae (Marine) . Site of Chloride Regulation in (J. E. Shelbourne), 920
Fish Proteins : Denaturation of (Dr. A. F. M. G. Luijpen), 1422
Fish Viscera *in vivo* : A 'Window' Technique for Observing (G. Burnstock), 1491
Fisher, E. W., and others : Inhibitory Effect of 5-Hydroxytryptophan on Acid Gastric Secretion, 1127
Fisher, James : Christmas Lectures at the Royal Institution, 1239
Fisher, Prof. Kenneth C. (Pengelley, Eric T., and) : Onset and Cessation o Hibernation under Constant Temperature and Light in the Golden-mantled Ground Squirrel (*Citellus lateralis*), 1371
Fisher, L. H. . Ionization Phenomena in Gases (Pre-Sparking Phenomena in Gases in Uniform and Non-uniform Fields), 792
Fisher, Dr. Stephen : Loss of Immunizing Power of Staphylococcal Toxin during Routine Toxoiding with Formalin, 1479
Fishery for *Pandalus borealis* in Greenland Waters (—. Horsted and —. Smidt), 892
Fishes (Marine) : Visual Pigments and Depths of Habitat of (Prof. George Wald, Paul K. Brown and Patricia Smith Brown), 969
Fishing Industry : Committee of Inquiry into the (Ministry of Agriculture, Fisheries and Food and the Scottish Home Department), 1171
Fisica, Società Italiana di : Third International Conference on Ionization Phenomena in Gases, 790
Fison Memorial Lecture (Sir John Cockcroft), 64
Fitch, V. L., and others (compiled and edited by) : High Energy Nuclear Physics—Proceedings of the Sixth Annual Rochester Conference (1956), *review* by Sir John Cockcroft, 303
Fitzpatrick, Dr. T. : Biology of Hair Growth (Nature of Hair Pigments), 593
Fixation of the Rabbit Pituitary Gland (M. Allanson, Dr. C. L. Foster and G. Menzies), 766
Fizika Poluprovodnikov (Dr. A. F Ioffe), *review* by Prof. R E Burgess, 1265
Flamborough, Yorkshire : Velocity of Compressional Waves for a Stratigraphic Profile of Chalk at (A. S. Laughton and A H. Stride), 977
Flame Radiation Research Foundation, International (British Flame Radiation Committee), (Institute of Fuel and the) : Symposium on Flames and Industry, 531
Flames supported by Active Nitrogen : Spectra of (K. R. Jennings and Dr. J. W. Linnett), 1272
Flames (Flat) : Absorption Spectra of, using a Multiple-Reflexion Technique (G. N. Spokes and Dr. A G. Gaydon), 1114
Flames and Industry (Institute of Fuel and the British Flame Radiation Committee of the International Flame Radiation Research Foundation Symposium on), 531
Flamingoes (Phoenicopteri) : The Filter Feeding and Food of (Penelope M. Jenkin), 128
Flammability of Apparel Fabrics in relation to Domestic Burning Accidents (British Standards Institution), 1102
Flammability of Textiles (Prof. C. S. Whewell), 1102
Flare (Solar) : Rocket Observation of X-Ray Emission in a (Dr. J. W. Warwick and Dr. H. Zirin), 500 ; (Dr. T. A. Chubb, Dr. H. Friedman, R. A. Kreplin and J. E. Kupperian, Jun.), 501
Flaschenträger, Dr. B (Bergold, Dr. G. H., and) : The Polyhedral Virus of *Prodenia litura* (Fabr) (Lepidoptera : Noctuidae), 1046
Flash Photolysis of Ozone : Production of Vibrationally Excited Oxygen Molecules in the (W. D. McGrath and Prof. R. G. W. Norrish), 1272
Flat Flames . Absorption Spectra of, using a Multiple-Reflexion Technique (G. N. Spokes and Dr. A. G. Gaydon), 1114
Flat Plates : Attractive Forces between (Dr. M. J. Sparnaay), 334
Flavin Monosulphate : Effect of, on Old Yellow Enzyme (Prof Hugo Theorell, Kunio Yagi, George D. Ludwig and Fujio Egami), 922
Flavours : Colours and (Nutritional Panel of the Food Group of the Society of Chemical Industry Meetings on Some Nutritional and Allied Problems confronting the Food Manufacturers, I), 1242
Flaws (Internal), in Bonded Cylinders of Soft Vulcanized Rubber subjected to Tensile Loads (A. N. Gent and P. B. Lindley), 912
Fleck, Sir Alexander : Elected an Honorary Fellow of the Royal Society of Edinburgh, 69
  Supply of Trained Men and Women, 305
  Elected president for 1958 of the British Association for the Advancement of Science, 528 ; work of, 528
Fleck, Sir Alexander, and others : Vitality in Administration, 153
Fleming, C. . Psychological and Occupational Aspects of Ageing, 903
Fletcher, Dr. J. M., and others : Given a Capper Pass Award of £120 by the Institution of Mining and Metallurgy and the Institute of Metals, 361
Fletcher, Dr. Ronald : Instinct in Man in the Light of Recent Work in Comparative Psychology, *review* by Prof. J Drever, 1257
Fleure, Prof Herbert John (Peake, the late Harold, and) : Times and Places, *review* by M C. Burkitt, 159
Flies (Fire-), *Photinus pallens* : Dried Lanterns from (Medical Research Council Tropical Metabolism Research Unit, University College of the West Indies), 1454
Flies (House-) : Specific DDT-Resistance in (R. W. Kerr, D. G. Venables, W. J. Roulston and H. J. Schnitzerling), 1132
Flint, Prof. Richard Foster : Glacial and Pleistocene Geology, *review* by Prof W B. R. King, 1261
Flip-Flop Circuit (Eccles-Jordan) : Analysis of Bistable Multivibrator Operation—the (P. A Neeteson), *review* by Dr. R. L. Smith-Rose, 401
Flooded Rice Fields . Chemical Examination of the Water of (R. Vámos), 1484
Flora (British) : Species Studies in the (edited by J. E. Lousley), (Botanical Society of the British Isles, Conference Report No. 4), *review*, 1155
Florey, Sir Howard : Awarded the Copley Medal for 1957 of the Royal Society, 1025, 1231 ; work of, 1231
Florigenic Hormone in the Strawberry (C. Sironval), 72
Florisbad Deposit : Fossil Suid Material recovered from the (R. F Ewer), 1393
Florkin, M. : The Origin of Life on the Earth, 888

Flour and Bread (Nutrition Society Symposium on), 317
Flow of Gases : Molecular (Prof. G. N. Patterson), *review* by Prof. T. G. Cowling, 451
Flow through Porous Media : The Physics of (Dr. Adrian E. Scheidegger), *review* by Dr. Paul Eisenklam, 1008
Flow of Steam—Water Mixtures at High Pressures (R. W. Haywood), 357
Flow Coefficients (T. H. Redding), 1393
Flow Noise (Acoustics Group of the Physical Society and the North-Eastern Branch of the Institute of Physics Discussion on), 893
Flower Inhibitor from Late Varieties of Peas : Leaching of a (Mrs. Janet I. Sprent and Prof. H. N. Barber), 200
Flowering of *Arabidopsis* : Effect of Day-length and Gibberellic Acid on the (J. Langridge), 36
Flowering in Rice : Control of, by Plant-Growth Substances (Dr. G. Misra and G. Sahu), 816
Flowering of *Xanthium* under Long-Day Conditions (D. de Zeeuw), 558
Flowering Plants : Expression of Sex in (Prof. H. G. Baker), 614
Flowers (Unisexual), in the Ericales (E. J. Godley), 284
Fluid Drops : Distortion of, in the Stokesian Region (Prof. F. H. Garner, K. B. Mathur and V. G. Jenson), 331
Fluids (Rotating) : Planetary Atmospheres and Convection in (Royal Meteorological Society and the Royal Astronomical Society Joint Symposium on), 1455
Fluorescein *iso*Cyanate-Globulin Conjugates : Rapid Extraction with Ethyl Acetate of Free Fluorescein Derivatives from (Dr. J. K. Dineen and G. L. Ada), 1284
Fluorescein Derivatives (Free), from Fluorescein *iso*Cyanate-Globulin Conjugates : Rapid Extraction with Ethyl Acetate of (Dr. J. K. Dineen and G. L. Ada), 1284
Fluorescence of Impurities, 786
Fluorescence Intensity of a Solution of Fresh Cigarette Smoke Products : Decrease in, on Exposure to Light (Hilda Johnston), 1350
Fluorescence Microscopy : Changes in Cellular Nucleic Acids during Infection with Poliomyelitis Virus as studied by (Dr. Esther Tenenbaum), 1044
Fluorescence Microscopy in the Study of Nucleic Acids—Histochemical Observations on Cellular and Virus Nucleic Acids (Dr. J. A. Armstrong and Dr. Janet S. F. Niven), 1335 ; Visual Observation of Deoxyribonucleic Acid Changes in Bacteria during Growth of Bacteriophage (Dr. E. S. Anderson), 1336
Fluorescent Pigment produced in *Microsporum*-Infected Hair : Chemical Nature of the (Prof. Frederick T. Wolf), 860
Fluoride : Measurement of Small Quantities of, with the Help of Fluorine-18 (Dr. J. H. Fremlin, Dr. J. L. Hardwick and J. Suthers), 1179
  Some Properties of Chromium deposited from an Electrolyte containing (N. E. Ryan, F. Henderson, S. T. M. Johnstone and H. L. Wain), 1406
Fluoride (Stannous or of Sodium) : Fluoride Removal by Powdered Dental Enamel from Solutions of (Dr. Frank A. Smith, Dwight E. Gardner, Dr. Samuel E. Leach and Dr. Harold C. Hodge), 1421
Fluoride Removal by Powdered Dental Enamel from Solutions of Stannous or of Sodium Fluoride (Dr. Frank A. Smith, Dwight E. Gardner, Dr. Samuel A. Leach and Dr. Harold C. Hodge), 1421
Fluorine-18 : Measurement of Small Quantities of Fluoride with the Help of (Dr. J. H. Fremlin, Dr. J. L. Hardwick and J. Suthers), 1179
9-α-Fluoro-11-β-Hydroxyprogesterone : Resistance of, to Inactivation in the Liver of the Guinea Pig (Prof. A. Lipschutz, Dusan Jadrejevic, Santiago Figueroa and Silvia Girardi), 508
Fluorosis (Experimental Chronic) : A Lipid Material in Bone and Teeth in (Gertrud Lindemann), 926
Flux, J. E. C. : Awarded a Nature Conservancy Research Studentship for Postgraduate Training in Ecology (Zoology), 467
Foetal Haemoglobin : Evidence of a Second, in the Newborn Goat (Dr. T. H. J. Huisman, H. K. A. Visser and H. J. van der Helm), 758
Foetal Myoglobin of the Cow : Amino-Acid Composition of Adult and (R. Tummer, H. J. van der Helm and Dr. T. H. J. Huisman), 239
Foetuses (Bovine) : *Leptospira* Antibody Production by (K. L. Fennestad and C. Borg-Petersen), 1210
Fofonoff, N. P. : The Abyssal Circulation of the Ocean, 733
Fogg, Dr. G. E. : Photosynthesis (Actual and Potential Yields in Photosynthesis), 1083
Follicles (Wool) : Classification of, in Sheep (Dr. A. B. Wildman), 99
Following the Non-stationary State of Polymerization Reactions : A Dilatometric Method of (Dr. W. I. Bengough), 1120
Fomes lignosus, a Pyrimidine-deficient Fungus (A. Riggenbach), 43
Fontaine, M., et autres : l'Instinct dans le Comportement des Animaux et de l'Homme, *review* by Dr. P. T. Haskell, 518
Food : Control of Chemical Additives in (Food Law Institute of the United States, the Food Group of the Society of Chemical Industry, the Society for Analytical Chemistry and the Association of Public Analysts of Great Britain Joint Discussion on), 692
  Quality Control of (Association of Public Analysts of Great Britain and the Food Group of the Society of Chemical Industry Joint Discussion on), 1326
Food of Flamingoes (Phoenicopteri) : The Filter Feeding and (Penelope M. Jenkin), 128
Food of the Young and the Adult Indian Mackerel, *Rastrelliger kanagurta* (Cuv.) : Differences in the (K. V. Narayana Rao and Dr. K. Pampapathi Rao), 711
Food Additives : General Principles governing the Use of (World Health Organization Technical Report Series No. 129), 1170
Food Consumption and Expenditure, 1955 : Domestic—Annual Report of the National Food Survey Committee (Ministry of Agriculture, Fisheries and Food), 587
Food Investigation, 1956 (Dr. P. L. Pellett), 844
Food Investigation Board : Report for 1956, with the Report of the Director of the Food Investigation Organization, 844
Food Law Institute of the United States, and others : Joint Discussion on the Control of Chemical Additives in Food, 692
Food Manufacturers : Some Nutritional and Allied Problems confronting the (Nutrition Panel of the Food Group of the Society of Chemical Industry Meetings on), 1, Colours and Flavours, 1242
Food Manufacturing Industries Research Association, British : Re-election of Prof. A. C. Frazer as president, 122
Food Survey Committee, National : Annual Report of the (Domestic Food Consumption and Expenditure, 1955), (Ministry of Agriculture, Fisheries and Food), 587
Food and Agriculture Organization (United Nations) : Yearbook of Forest Products Statistics (1956), 72
  Resignation of Dr. Ralph W. Phillips as deputy director of the Agriculture Division, 122
  Report of the First Meeting of the European Contact Group on the Uses of Isotopes and Radiation in Agricultural Research (Wageningen, 1956), 275
  The Forest Work of the (Sir Beresford Pierce), 363
Forage (Cereal) : Effect of Leaf Rust on (A. F. Greenall), 1000
Forces (Attractive), between Flat Plates (Dr. M. J. Sparnaay), 334
Ford, Dr. C. E., and others : Chromosome Polymorphism in the Common Shrew, 392
Ford, Dr. E. B. : Polymorphism in Plants, Animals and Man, 1315
Ford, Prof. H. : Appointed to the University of London chair of applied mechanics at the Imperial College of Science and Technology, 21
Ford (Henry) Hospital Symposium : Enzymes—Units of Biological Structure and Function (edited by Oliver H. Gaebler), *review* by Prof. D. D. Woods, 1379
Foreign Cations in Silver Azide (Dr. A. D. Yoffe, B. L. Evans and S. K. Deb), 294
Foreign Erythrocytes : Induction of Immunological Tolerance in Rats to (Dr. G. J. V. Nossal), 1427
Foreign Fellowships : Lilly (Medical Research Council Awards for 1957-58), 315
Foreman, Eileen E. (Bidwell, K. W. E., and) : Distribution of Strontium-90 in Pond Weed and Fish, 1195
Forest, E. : Appointed veterinary officer, Jamaica, 688
Forest Department, British Guiana : Report for 1955, 272
Forest Fungi (Margaret E. Lancaster), *review* by Dr. J. Ramsbottom, 1155
Forest Policy for Kenya (White Paper on a), 636
Forest Products Statistics : Yearbook of, 1956 (Food and Agriculture Organization of the United Nations), 72
Forest Research in Britain (Dr. E. W. Jones), 967
Forest Research, Department of (Federation of Nigeria) : Appointment of R. W. J. Keay as principal research officer, 1454
Forest Species (Canadian) : Growth and Morphogenesis in (G. H. Duff and N. J. Nolan), 1393
Forest Work of the Food and Agriculture Organization of the United Nations (Sir Beresford Pierce), 363
Forestry in the Commonwealth, 272
Forestry and the United Nations, 363
Forestry Commission : Thirty-seventh Annual Report of the Forestry Commissioners (1955-1956), 846
  Report on Forest Research for the Year 1955-1956, 967
Forestry Research in East Africa : Agricultural and, 786
Forests Department, Sudan : Report for 1954-55, 272
Forgacs, O. L., and others : Fundamental Aspects of Fibres and their Treatment for Paper (Hydrodynamic Behaviour of Papermaking Fibres), 1177
Formalin : Loss of Immunizing Power of Staphylococcal Toxin during Routine Toxoiding with (Dr. Stephen Fisher), 1479
Forman, Z., and others : Development of Chemical Thermoregulation in Piglets, 858
Formation of Bacterial Amylase : Effects of Carbon Sources and Base Analogues of Nucleic Acid on the (Juichiro Fukumoto, Takehiko Yamamoto and Daisuke Tsuru), 438
Formation of Banded Structures in Steel : The Mechanism of the (Prof. Paul Bastien), 787
Formation of a Labile Phospholipoprotein during the Clotting of Platelet-rich Plasma : Evidence for the (Dr. G. V. R. Born), 546
Formation of Liesegang-like Rings by Metal Ions and Chelating or Complexing Agents (Prof. Robert E. Feeney and Nelle Bennett), 979
Formation of β-1,4-Oligoglucosides by certain *Acetobacter* Species (Dr. Robert Steel and Dr. Thomas K. Walker), 201
Formazan in the Tissues of the Pea Radicle : A Quantitative Comparison of Sulphydryl Content and (B. Jámbor, M. Dévay and Dr. L. W. Roberts), 997
Forming Solution Concentration-gradients : A Simple Device for (Donald B. Wetlaufer), 1122
Forrest, Dr. J. S. : High-Voltage Transmission Systems, *review*, 1379
Forsling, Wilhelm, and others : Discovery of Element 102, 120
Forsyth, Dr. F. R., and others : Effect of Benzimidazole on Detached Wheat Leaves, 1294
Forsyth, Dr. W. G. C., and Simmonds, N. W. : Anthocyanidins of *Lochnera rosea*, 247
Forty, Dr. A. J. : Vacuum Deposition of Metals (Role of Crystal Boundaries as Sites for Nuclei from which the Growth of Films could start), 124
Forty Years beside the Glass Industry (C. E. Ramsden), 1098
Forward-scatter Communication (Ionospheric) : Delayed Signals in (G. W. Luscombe), 138
Fossil Brachiopods, *review* by Prof. Alwyn Williams, 401
Fossil Pigs of Florisbad, 1393
Fossil Remains from Fibrous Peats and Moss Polsters : A Method for Concentrating Pollen Grains and Small (D. M. Churchill), 1437
Fossil Suid Material recovered from the Florisbad Deposit (R. F. Ewer), 1393
Fossil and Recent Man : Tooth Eruption Sequence in (Dr. Stanley M. Garn and Dr. Kalevi Koski), 442
Foster, Dr. A. B., and Hackman, R. H. : Application of Ethylenediaminetetra-acetic Acid in the Isolation of Crustacean Chitin, 40
Foster, Dr. A. B., and others : Characterization of 2-Amino-2-Deoxy-D-Altrose, 247
Foster, Dr. C. L., and others : Fixation of the Rabbit Pituitary Gland, 766
Foster, Dr. E. L., and Heap, H. : Rheology of Elastomers (Elastic Recovery, Flow and Stress Relaxation), 76
Fothergill Prize for 1957 of the Royal Society of Arts awarded to P. B. Smith, 891
Foul Brood : European—a Disease of the Larval Honeybee (*Apis mellifera* L.) caused by a Combination of *Streptococcus pluton* (*Bacillus pluton* White) and *Bacterium eurydice* White (L. Bailey), 1214
Foundation Engineering : Soil Mechanics and—Fourth International Conference (D. J. Maclean), 839
Foundation Engineering, International Society of Soil Mechanics and : Fourth Conference, 270, 839
  Election of Prof. A. W. Skempton as president, 840
Foundations of Inductive Logic (Roy Harrod), *review* by D. V. Lindley, 208

Foundations of Mathematics : Remarks on the (Ludwig Wittgenstein), edited by G. H. von Wright, R. Rhees and G. E. M. Anscombe (translated by G. E M. Anscombe), *review* by F. I. G. Rawlins, 399
Foundations of Natural Philosophy (J. G. Bennett), (The Dramatic Universe, Vol 1), *review* by Dr S. Raimes, 302
Foundations' Fund for Research in Psychiatry, New Haven, Conn. : Research Fellowships in Psychiatry and related Sciences, 953
Fourmarier (Paul) Prize for 1947-56 awarded to Prof. Arthur Holmes by the Royal Academy of Belgium, 316
Fowl : Primary Sex Ratio of (Prof. Walter Landauer), 1139
Fowl Plague Virus : Growth of, in Macrophages and Giant Cells (Dr. Richard M. Franklin), 510
Fowles, G. : Chemistry, the Conquest of Materials, *review*, 352
  Introduction to Structure in Organic Chemistry, *review*, 453
  Elementary Practical Organic Chemistry, *review*, 569
  Quantitative Chemical Analysis, *review*, 676
  Volumetric Analysis, third edition, *review* by A. C. Cavell, 676
  Lecture Experiments in Chemistry, fourth edition, *review* by A. C. Cavell, 878
  A Text Book of Theoretical and Inorganic Chemistry, *review*, 878
  Physical Chemistry for Students of Pharmacy and Biology, *review*, 1269
Fowles, Dr. G. W. A. (Cartmell, E., and) : Valency and Molecular Structure, *review* by Prof. J R. Partington, 109
Fox, Brian, and others : Metabolism and Metabolic Effects of Thyroglobulin, 195
Fractionation of Human Erythrocytes on the Basis of their Age (Ernest R. Simon and Yale J. Topper), 1211
Fractionation of Isolated Lucerne and other Triterpenoidal Saponins (Dr. C B. Coulson), 1297
Fractionation of Phosphorus Compounds in Ossifying Cartilage (R. G. Whitehead and Dr. S M. Weidman), 1196
Fred, Prof. William A., and Herold, Dr. Paul G. : Quantitative Estimation of Graphite in Refractory Carbon Deposits by X-Ray Technique, 1273
Fraenkel-Conrat, H. : Protein Structure and Biological Activity, 835
Framework of Management : Organization—the (E. F. L. Brech), *review* by Rosemary Stewart, 621
France, J. R. D., and Minton, P. : Aerodynamic Drag of Perforated Plates, 702
Frank, Prof. F. C. : Vacuum Deposition of Metals (The Frank—van der Merwe Theory of Critical Misfit in Epitaxy), 124
Frank, Prof. F. C., and others : Lectures at the University of Bristol on Observations of Dislocations in Metals and Inorganic Crystals, 467
Frank, S. G. F., and others : Longitudinal Polarization of the Positrons from the Decay of Unpolarized Positive Muons, 751
Frankel, Dr. J. J. : Elected a Fellow of the Royal Society of South Africa, 1025
Franklin, Dr. Rosalind E. : Protein Structure and Biological Activity, 835
Franklin, Dr. Rosalind E. (Watt, J. D., and) : Changes in the Structure of Carbon during Oxidation, 1190
Franklin, Dr Richard M. : Growth of Fowl Plague Virus in Macrophages and Giant Cells, 510
Franklin, R. W. : Structure of Non-porous Anodic Films on Aluminium, 1470
Franklin Institute : Report for 1956, 178
Fraser, A. F. : Appointed veterinary officer, Jamaica, 413
Fraser, Dr. A. R. : Promoted to Senior Principal Scientific Officer by the United Kingdom Atomic Energy Authority, 639 ; work of, 639
Fraser, Dr. D. A. : Tree Physiology (Importance of Xylem Sap in the Transport of Organic Nitrogenous Materials), 77 ; (Physiology of Reproduction), 78
Fraser, D. O : Avoidance of Collision at Sea and in the Air—Collisions in the Air, 214
Fraser, Sir Francis : Biology of Hair Growth, 592
Fraser, Dr. F. C. : Appointed keeper of zoology in the British Museum (Natural History), 122, 216 ; work of, 216
Fraser, Dr. R. : Regard the Earth, 269
  Once round the Sun—the Story of the International Geophysical Year, 1957-58, *review* by Dr. M. A. Ellison, 623
Frazer, Prof. A. C. . Re-elected president of the British Food Manufacturing Industries Research Association, 122
Frazer, J. R. (Nicholls, Dr. J. R., and) · Flour and Bread (Analytical Problems in the Determination and Control of Extraction-rates of Flour), 318
Free Amino-Acids in Tomato : Molybdenum Nutrition and (J. V. Possingham), 363
Free Balloon : Solar Granulation and its Observation from a (Dr. D. E. Blackwell, Dr. D. W. Dewhirst and Dr. A. Dollfus), 211
Free Electron Model : Chemical Shifts in $C_5H_5^-$ and $C_7H_7^+$ Ions—the (J R. Leto, F. A Cotton and Dr. J. S. Waugh), 978
Free Energy of Hydrolysis of Adenosine Triphosphoric Acid (G. E. Vladimirov, V. G. Vlasova, A. Y. Kolotilova, S. N. Lyzlova and N. S. Pantereyeva), *erratum*, 363
Free Fluorescein Derivatives from Fluorescein *iso*Cyanate-Globulin Conjugates : Rapid Extraction with Ethyl Acetate of (Dr. J. K. Dineen and G. L. Ada), 1284
Free Radicals (Short-lived), in Solution : Observation of (Prof. G. Porter and M. W. Windsor), 187
Free-Trade Area (European) : The Balance-of-Payments Problems of a (Prof J. E. Meade), 481
Freedman, Dr. M : Appointed to the University of London readership in anthropology at the London School of Economics and Political Science, 220
Freedom of Science : Christian Faith and the (Dr R Hooykaas), 71
Freedom (Academic), in South Africa, 686
Freedom (Science and), International Committee on : Bulletin, No. 9, *Apartheid* and its threat to South Africa's Universities, 686
Freedom (Science and), International Committee on, in co-operation with the Association of University Teachers : Meeting in London in support of the South African Universities against *apartheid*, 686, 1163
Freeman, R. F. H : *Paravortex scrobiculariae* (Graff) in Great Britain, 1213
Freeman, T. W. : Pre-Famine Ireland, a Study in Historical Geography, *review* by J P. Haughton, 1440
Freezing and Drying (Institute of Biology International Symposium on), 838
Fremlin, Dr. J. H. : Relativity and Space Travel, 499
Fremlin, Dr. J. H., and others : Measurement of Small Quantities of Fluoride with the Help of Fluorine-18, 1179
French Exchange Scholarships in Medical Science (Medical Research Council Awards for 1957-58), 315
French Metallurgical Society : Autumn Meeting, 219
  Grand Medal presented to Prof. G. Chaudron, 219
  Rust Prizes presented to G. Pomey and A. Gueussier, 219
Frequency Comparator using Electron and Proton Resonance in a Common Magnetic Field (O. Nourse), 192
Frequency Drift of Short-Time Transients in Solar Radio Noise (Øystein Elgaroy), 862
Frequency Modulation (L B. Arguimbau and R. D. Stuart), *review* by Dr. R. L. Smith-Rose, 206
Frequency Modulation in Radio, *review* by Dr. R. L. Smith-Rose, 206
Frequency Modulation Engineering (Christopher E Tibbs and G. G. Johnstone), second edition, *review* by Dr. R. L. Smith-Rose, 206
Frequency-Range (Wide) : Arrays with Constant Beam-Width over a (Prof. D. G. Tucker), 496
Fresh Cigarette Smoke Products : Decrease in Fluorescence Intensity of a Solution of, on Exposure to Light (Hilda Johnston), 1350
Fresh Water from Salt Water (D. Neville-Jones), 171
Freshwater Eel *Anguilla obscura* Gunther, 1871, in Southern Africa (R. A. Jubb), 1216
Fresnel Integral : Table of the, to Six Decimal Places (compiled by T. Pearcey), *review* by Dr. H. H. Hopkins, 6
Freudenberg, K. : Biological Rhythms (Data on Mortality), 1101
Frey-Wyssling, Prof. A. : Fundamental Aspects of Fibres and their Treatment for Papermaking (Morphology of Pulp Fibres—General Structure of Fibres), 1175
Fric, René (recueillie et annotée par) : Oeuvres de Lavoisier, Fascicule 2, 1770-1775, *review* by Sir Harold Hartley, 1260
Fricke, Hugo, and others : Role of Structural Degradation in the Loss of Serological Activity of Ovalbumin irradiated with Gamma-Rays, 1423
Friedel, Dr. J. : Materials for Nuclear Engineering (Structure of Materials), 469
Friedman, Arnold M., and others : Discovery of Element 102, 120
Friedman, Constance L., and others : Effect of Angiotonin on the Distribution of Sodium, Potassium and Water in the Rat, 194
Friedman, Dr. H , and others : Rocket Observation of X-Ray Emission in a Solar Flare, 501
Friedman, Prof. Sydney M., and others : Effect of Angiotonin on the Distribution of Sodium, Potassium and Water in the Rat, 194
Friedman, I. (Drew, Dr. Kathleen M., and) : Occurrence of Motile Gametes in *Prasiola stipitata* Suhr, 557
Friedrich, L., and others : Visual Problems of Colour (Extra-Foveal Colour-Matching), 1397
Frieman, E., and others : Ionization Phenomena in Gases (Invariants of Motion in Ionized Gases), 794
Friend, Dr. J. : Vegetable Quality, 174
Friend, Dr. J A. : High Polymer, Colloid and Surface Chemistry (Use of Ultra-violet Absorption Spectra in determining Critical Micelle Concentrations of Solutions of Alkyl Pyridinium Iodides in Water and Organic Solvents), 959
Friendly Fungi, a New Approach to the Eelworm Problem (C. L. Duddington), *review* by R. Chamberlain, 936
Frisch, Prof. O. R. (edited by) : Progress in Nuclear Physics, Vol. 5, *review* by Dr. T. G. Pickavance, 2
Fröhlich, Margaret M., and others : Effect of Storage of Methylcellulose on Blood Protein Formation in the Rat, 1474
Fromageot, Prof. C. : Biochemistry of Sulphur, 466
  Protein Structure and Biological Activity, 833
Froome, Dr. K. D. : Awarded the Clerk Maxwell Premium of the British Institution of Radio Engineers, 529
  Promoted to Senior Principal Scientific Officer in the Scientific Civil Service, 638 ; work of, 638
Frost, Dr. B. R. T. : Materials for Nuclear Engineering (Wetting of Solids by Liquid Metals), 469
Frost, Dr. L C : Appointed lecturer in genetics in the Department of Botany in the University of Bristol, 1171
Froyd, G. : Appointed veterinary research officer, Kenya, 1098
Fruit (Baobab) · Ascorbic Acid Content of (Bruce M. Nicol), 287
Fruits (Citrus), of Assam : Classification of (S. C. Bhattacharya and S. Dutta), 171
Fucales · An Acetocarmine Squash Technique for the (Dr. Margaret Naylor), 46
Fucose to Glucose : Pathway of the Synthesis of, in *Klebsiella aerogenes* (Dr. J F. Wilkinson), 995
Fuel : Pulverized (Institute of Fuel Second Conference on), 270, 531
Fuel, Institute of : Conference on Pulverized Fuel, 270, 531
  Residential Conference on Science in the Use of Coal, 531
  Residential Conference on Major Developments in Liquid-Fuel Firing (1948-1959), 531
  Conference on Science in the Use of Coal, 893
  Admitted to membership of the British Nuclear Energy Conference, 1098
Fuel, Institute of, and the British Flame Radiation Committee of the International Flame Radiation Research Foundation : Symposium on Flames and Industry, 531
Fuel, Institute of, and the Combustion Institute : Seventh International Symposium on Combustion, 531
Fuel Efficiency Advisory Committee : Appointment of Dr. D. T. A. Townend and Dr. A. C. Monkhouse to the, 172
Fuel (Liquid-) Firing, 1948-1959 : Major Developments in (Institute of Fuel Residential Conference on), 531
Fuglister, F. C : The Abyssal Circulation of the Ocean, 733
Fujimori, Dr. E., and Livingston, Prof. Robert : Interactions of Chlorophyll in its Triplet State with Oxygen, Carotene, etc., 1036
Fujioka, Kenjiroo, and others : Effects of Kinetin on Division of Yoshida Sarcoma Cells, 985
Fukada, E : Rheology of Elastomers (Irradiated Rubbers), 76
Fukuda, T. . Conversion of Pyruvic Acid to Alanine in the Silkworm Larva, 245
Fukui, Henry N., and others : Ethyl-3-Indoleacetate—an Artefact in Extracts of Immature Corn Kernels, 1205
Fukumoto, Juichiro, and others : Effects of Carbon Sources and Base Analogues of Nucleic Acid on the Formation of Bacterial Amylase, 438
Fukushi, K., and others : Morphological Changes of Tubercle Bacilli caused by Staining Procedures, 42

Fulbright Programme Travel Grants, 1028
Fulmer Research Institute Open Day, 416
Fulton, T., and others (compiled and edited by) : High Energy Nuclear Physics—Proceedings of the Sixth Annual Rochester Conference (1956), *review* by Sir John Cockcroft, 303
Function (Biological Structure and) : Enzymes—Units of (edited by Oliver H Gaebler), *review* by Prof. D. D Woods, 1379
Functioning of the Nervous System Structure and (British Association for the Advancement of Science, Section D (Zoology), Symposium on), 1388
Functions (Parabolic Cylinder) : Tables of Weber (edited by Dr. J. C P. Miller), *review* by Dr. C. W. Jones, 400
Fundamental Aspects of Fibres and their Treatment for Papermaking (British Paper and Board Makers' Association Symposium on), 1175
Fundamental Research on Paper-making Fibres (Dr. Julius Grant), 1175
Fundamentals of Chromatography (Prof Harold Gomes Cassidy), *review* by Dr. R. Consden, 773
Fundamentals of Immunology (Prof William C. Boyd), third edition, *review* by Prof J. R. Marrack, 257
Fungal Preparations : Saccharification of Potato Mashes by means of (K. Beran, M. Burger and S. Zelenka), 362
Fungal and Bacterial Extracts : Lethal Effects on Plant Cells of (S G. Fushtey), 20
Fungi . Decomposition of Chloro-organic Acids by (Prof. H. L Jensen), 1416
  Defence Mechanism of Plants against—Fungistatic Properties of Apple Leaf Wax (Dr. J T Martin, R. F Batt and R. T. Burchill), 796 ; Solubilization of Copper by Leaves and Water-soluble Acids from Leaf Wax (Dr J T. Martin and E Somers), 797 , Sorption of Copper from Burgundy Mixture by Leaves (E. Somers and D. V Richmond), 798
  Forest (Margaret E Lancaster), *review* by Dr J. Ramsbottom, 1155
  The Friendly—a New Approach to the Eelworm Problem (C. L. Duddington), *review* by R. Chamberlain, 936
  Useful, *review* by R. Chamberlain, 936
Fungi in Air . Electrostatic Charges on Spores of (Prof P H Gregory), 330
Fungi (Higher), Hymenomycetes . Mitosis in Vegetative Hyphae of (Prof. S R Rose), 45
Fungi and Algae : X-Ray Interferences of Barium Sulphate in (Dr. D. R. Kreger), 867
Fungistasis as a Factor in the Rhizosphere Phenomenon (R M Jackson), 96
Fungistatic Activity of some Hydroxamic Acids (Dr. J. Alklewicz, Dr. Z Eckstein, Miss H. Halweg, Dr. P Krakówka and Prof T. Urbański), 1204
Fungistatic Properties of Apple Leaf Wax (Defence Mechanism of Plants against Fungi), (Dr J T Martin, R. F Batt and R. T Burchill), 796
Fungus : *Fomes lignosus*, a Pyrimidine-deficient (A. Riggenbach), 43
Fungus (Potato Blight) : Infection of Native *Solanum* Species by the (C. M. Driver), 1367
Fungus (Weed), of Mushroom Compost *Heleococcum aurantiacum*, an Uncommon (F C Wood), 283
Funkortung, Ausschuss fur, and others Joint Meeting on the Avoidance of Collision by Airborne and Shipborne Means, 213
Furshpan, Dr. E. J , and Potter, D D Mechanism of Nerve-Impulse Transmission at a Crayfish Synapse, 342
Further Education in the North of England, 1323
Further Education, Northern Advisory Council for Tenth Annual Report, 1323
Fusarium oxysporum Schl emend Sn et H : Serological Studies on (A. Tempel), 1483
Fuschillo, Prof N , and Renton, C A . Nuclear Magnetic Resonance of Methane adsorbed on Titanium Dioxide, 1063
Fused Electrolytes Hexagonal Chromium Crystals from (Dr R. S. Dean and F. X. McCawley), 435
Fushtey, S. G Lethal Effects on Plant Cells of Fungal and Bacterial Extracts, 20
Fusion (Nuclear) Power from (J D. Lawson), 780
Fusobacterium Species Isolation of *Leptotrichia buccalis* and, from Oral Material (A C Baird-Parker), 1056
Future Our Debt to the (Royal Society of Canada Symposium on), 259

GABOR, Dr. D. : Awarded a grant of £100 from the Paul Instrument Fund, 734
Gabor, Dr D , and Hampton, B. : A Wilson Cloud Chamber with Time-marking of Particle Tracks, 746
Gaddum, Prof J. H. : New Pathways in Cellular Pathology, *review*, 59
  The Principles of Therapeutics, *review*, 109
  Appointed director of the Agricultural Research Council Institute of Animal Physiology, 787
Gadsden, Dr. M (Unwin, R S , and) . Determination of Auroral Height by Radar, 1469
Gaebler, Oliver H (edited by) : Enzymes—Units of Biological Structure and Function, *review* by Prof. D D. Woods, 1379
Gahan, P. B., and others : Uptake of Benzpyrene by a Chromosomal Phospholipid, 652
Gaidukov, Y P. (Alekseevsky, N E., and) . Low-Temperature Physics (Resistance Minimum in Gold), 461
Galathea Deep Sea Expedition, 1950-1952 (edited by Dr Anton F. Bruun, Sv. Greve, Hakon Mielche and Dr. Ragnar Sparck), translated from the Danish by Reginald Spink, *review* by Dr L Harrison Matthews, 349
Galathea Reports, Vol 1, 687
Galaxy : An Attempt to detect Linearly Polarized Radio Emission from the (J M. Thomson), 495
  The Large-Scale Structure of the (F J. Kerr, J V Hindman and Martha Stahr Carpenter), 677
Gale, Dr. E F. : Dictionary of Microbiology, *review*, 209
Galileo on the Ptolemaic and Copernican Systems, *review* by Prof. E. J Dijksterhuis, 450 ; 1374
Galileo Galilei : Dialogue on the Great World Systems (in the translation of T. Salusbury ; edited, corrected, annotated and provided with a Historical Introduction by Prof. Giorgio de Santillana, *review* by Prof. E. J. Dijksterhuis, 450
Galkin, A. A. (Bezuglý, P. A., and) . Low-Temperature Physics (Cyclotron Resonance in Tin), 461
Galley, Dr. W. Fundamental Aspects of Fibres and their Treatment for Papermaking (Process of Beating—Aspects of the Theory of Beating), 1177
Gallium Deuteride : Band Spectrum of Gallium Hydride and (H Neuhaus), 433
Gallium Hydride and Gallium Deuteride Band Spectrum of (H Neuhaus), 433
Gallivan, John D. : Science in Schools (The Rev Dr. Callan of Maynooth, Pioneer of Electrical Research), 730
Galloway, Dr Ian A . The Research Institute (Animal Virus Diseases), Open Days, 210
Galton Medal of the Eugenics Society presented to Dr C. P. Blacker, 1461
Gamble, G. Appointed provincial agricultural officer, Kenya, 688
  Appointed assistant director of agriculture (Field), Kenya, 1098
Gamble, Dr. H. J. : Temperature Effects in Mammalian Nerve Regeneration, 146
Gambling Risk and, the Study of Subjective Probability (Prof John Cohen and Mark Hansel), *review* by R. L. Gregory, 158
Gametes (Motile) : Occurrence of, in *Prasiola stipitata* Suhr (Dr. Kathleen M. Drew and L Friedmann), 557
γ-Aminobutyric Acid and Arginine : Biosynthesis of γ-Guanidinobutyric Acid from (John J. Pisano, Chozo Mitoma and Sidney Udenfriend), 1125
γ-Guanidinobutyric Acid : Occurrence of (F. Irreverre, R. L. Evans, A R Hayden and R. Silber), 704
γ-Guanidinobutyric Acid from γ-Aminobutyric Acid and Arginine : Biosynthesis of (John J Pisano, Chozo Mitoma and Sidney Udenfriend), 1125
γ-Radiation : Dependence on Oxygen and Temperature of the Sensitivity of Broad Bean Roots to (G. J. Neary), 248
Gamma-Ray Irradiation . Effects of, on Nematodes infesting Cultivated Mushroom Beds (F C. Wood and J. B. Goodey), 760
Gamma Rays . Effect of, on the Sprouting of Stored Mangolds (C. E. Cornford and D. B. Powell), 996
  Effect of Exposure to, on the Hygroscopicity of Sitka Spruce Wood (J. M. Paton and R. F. S Hearmon), 651
  Role of Structural Degradation in the Loss of Serological Activity of Ovalbumin irradiated with (Hugo Fricke, Charles A Leone and Wendell Landmann), 1423
γ-Rays (Cobalt-60) : Response of the Ceric-Cerous System at High Dose-Levels of (B. Whittaker), 1302
Gamzemlidze, G. A . Low-Temperature Physics (Existence of Discontinuity Surfaces in Moving Liquid Helium), 461
Ganglioside (Brain) : Structure of (Dr. Samuel Bogoch), 197
Gannon, Dr R. P Awarded an Alexander Pigott Wernher Memorial Travelling Fellowship in Ophthalmology and Otology for 1957-58 by the Medical Research Council, 315
Garber, Prof. E. D , and Shaeffer, Susan G : Methionine Biosynthesis and Utilization in *Pseudomonas tabaci* and *Ps. angulata*, 1282
Garden : A Geological, constructed at Leeds (Dr D E Owen), 19
Gardner, Dwight E., and others Fluoride Removal by Powdered Dental Enamel from Solutions of Stannous or of Sodium Fluoride, 1421
Garlick, Prof. G F. J. : Awarded a grant of £2,700 from the Paul Instrument Fund, 734
Garn, Dr Stanley M , and Koski, Dr. Kalevi Tooth Eruption Sequence in Fossil and Recent Man, 442
Garner, Prof F. H. : Chemical Engineering Education, 125
Garner, Prof F. H., and others : Distortion of Fluid Drops in the Stokesian Region, 331
Garratt, A J. The National Physical Laboratory—Open Days, 166
Garratt, Dr D C. . Modern Analytical Chemistry in Industry (Analytical Developments in a Pharmaceutical Laboratory), 367
Garreau, Dr. G. A. Tables of Integrals and other Mathematical Data, *review*, 1270
Garrett, Dr S. D Ecologists in the Laboratory, *review*, 351
Garton, W. R. S . Title of reader in physics in the University of London at the Imperial College of Science and Technology conferred on, 122
Garton, W. R. S , and Latham, Dr. R Ionization Phenomena in Gases, 790
Gas (Natural), in Scotland (T. S. Ricketts and D. C. Elgin), 1444
Gas Chromatographic Columns A Performance Index for (Marcel J. E Golay), 435
Gas Chromatography (N. H. Ray), 403
Gas Chromatography (Gas Chromatography Discussion Group of the Institute of Petroleum and the Koninklijke Nederlandse Chemische Vereniging Symposium on), 838
Gas Chromatography (Analysis Instrumentation Division of the Instrument Society of America International Symposium on), 220, 840
Gas Chromatography : Column Packings for (Symposium on, organized by the Gas Chromatography Discussion Group under the auspices of the Hydrocarbon Research Group of the Institute of Petroleum), 220
  A Hydrogen-Conversion Detector for (G E Green), 295
  Instrumentation for, 530
  Scott Microflame Detector for (Shandon Scientific Co., Ltd.), 530
  Vapour Detectors for (Gas Chromatography Discussion Group of the Institute of Petroleum Symposium on), 22
Gas Council Award of Research Scholarships, 530
Gas Discharges (High-Current) Multipole Radiation from (Dr S. Kaufman), 1345
Gas Dynamics : Kinetic Theory and, *review* by Prof T G. Cowling, 451
Gas Industry : Annual Report, 1321
Gas Refrigerating Machine, P.W 7000 : Philips, 892
Gas Separation : Recent Developments in Industrial Low Temperature (Low Temperature Group of the Physical Society and the Institution of Chemical Engineers Conference on), 270, 1028
Gas-cooled Reactors : Creep Tests on Materials for (New research equipment in the Materials Research Laboratory of the General Electric Company's Atomic Energy Division), 1392
Gas-Liquid Chromatography : High Efficiency Columns for the Analysis of Hydrocarbons by (R. P W Scott and J D. Cheshire), 702
Gascoyne, W . Appointed deputy director of surveys, Western Region, Nigeria, 21
Gaseous Detonation Waves : Effect of Tube Diameter on the Pressures in (Dr D. H. Edwards and G. T. Williams), 1117

Gases : Ionization Phenomena in (Società Italiana di Fisica Third International Conference on), 790
  Molecular Flow of (Prof. G. N. Patterson), *review* by Prof. T. G. Cowling, 451
Gases (Unsaturated Hydrocarbon) : Electric Strength of (Dr. A. E. D. Heylen), 703
Gastric Secretion (Acid) : Inhibitory Effect of 5-Hydroxytryptophan on (A. N Smith, J W. Black and E. W. Fisher), 1127
Gastro-intestinal Bleeding Lesions : Isotopic Tracer Method for Measurement of Iron lost into and re-absorbed from (M. Roche, M E. Perez-Gimenez and A Levy), 1278
Gastropod (Marine), *Neptunea antiqua* : An Acetylcholine-like Salivary Poison in the (Dr. Ragnar Fänge), 196
Gatenby, Prof J. Bronte : Histo-pathology, *review*, 1079
Gattani, Dr. M. L. : Production of Sclerotic Granules by *Streptomyces* sp , 1293
Gattungen der Rhodophyceen (H. Kylin), 112
Gauld, Dr. D. T. : Copulation in Calanoid Copepods, 510

Histochemical Appearances of Cholinesterase in the Normal Sciatic Nerve and the Changes which occur after Nerve Section (Dr. R. S. Snell), 378
Histochemical Observations on Cellular and Virus Nucleic Acids (Fluorescence Microscopy in the Study of Nucleic Acids), (Dr. J. A. Armstrong and Dr. Janet S. F. Niven), 1335
Histochemical Technique : Use of a, to demonstrate the Cutaneous Penetration of Adrenalin and Nor-Adrenalin (Dr. G. H. Bourne), 1488
Histological Technique for Normal and Pathological Tissues and the Identification of Parasites (H. M. Carleton, with the collaboration of R. A. B. Drury), third edition, *review* by Prof. J. Bronte Gatenby, 1079
Histology, Biochemistry and Pathology (The Collected Papers of Paul Ehrlich, compiled and edited by Dr. F. Himmelweit, with the assistance of Martha Marquardt, under the editorial direction of Sir Henry Dale, Vol. I), *review* by Prof. C. H. Browning, 620
Histones of Calf Thymocytes : Amino-Acid Composition of the Six (Dr. H. J. Cruft, J. Hindley, Dr. C. M. Mauritzen and Dr. E. Stedman), 1107
Histo-pathology, *review* by Prof. J. Brontë Gatenby, 1079
Historical Geography : Pre-Famine Ireland, a Study in (T. W. Freeman), *review* by J. P. Haughton, 1440
Historicism : The Poverty of (Prof. Karl R. Popper), *review* by Dr. C. K. Grant, 1255
History of Industrial Chemistry (Dr. F. Sherwood Taylor), *review* by Prof. John Read, 723
History of the School of Tropical Medicine in London, 1899–1949 (Sir Philip Manson-Bahr), *review* by Prof. T. H. Davey, 205
History of Whiteknights (Dr. Ernest Smith), 18
History and Philosophy of Science at University College, London, 267
History (Early), of the Sauropsid Reptiles : On *Millerosaurus* and the (Prof. D. M. S. Watson), 128
Hizukuri, Susumu, and Nikuni, Ziro : Micelle Dimension of Potato Starch, 436
Ho, Robert : Corrugated Iron Pan, 1276
Hoagland, Hudson (edited by) : Hormones, Brain Function and Behavior—Proceedings of a Conference on Neuroendocrinology (New York, 1956), *review* by Dr. Marthe Vogt, 304
Hoare, Dr. C. A. : Everyman's Parasitology, *review*, 1079
Hoare, Dr. F. E., and Preston, J. : Properties of Palladium—Rhodium Alloys, 334
Hobbs, G. (Willis, A. T., and) : A Modified Nagler Medium, 92, *erratum*, 220
Hoblyn, Dr. E. H. T. : Chemical Engineering Education, 125
Hobson, Dr. J. D. : Appointed an Imperial Chemical Industries Research Fellow at the University of Birmingham, 738
Hochschulen of Western Germany : The Technische (Dr. J. Horne), 1445
Hocart, R. : At the meeting of the Teaching Commission of the International Congress on Crystallography (Study of the Historical Development of our Knowledge of Zeolites), 957
Hocker, K. H. : Ionization Phenomena in Gases (The Anode-Drop in Low-Pressure Discharges and High-Current Arcs), 792
Hocking, Dr. C. S. : High Polymer, Colloid and Surface Chemistry (Effect of Changes in the Degree of Hydrolysis and Molecular Weight of Polyvinyl Alcohols on Surface Properties, 959
Hodge, Dr. Harold C., and others : Fluoride Removal by Powdered Dental Enamel from Solutions of Stannous or of Sodium Fluoride, 1421
Hodge, Prof. W. V. D. : Awarded a Royal Medal for 1957 of the Royal Society, 1095, 1231 ; work of, 1231
Hodges, Dr. R. : Appointed a lecturer in chemistry at the University of Glasgow, 1172
Hodgkin, D. : At the International Congress on Crystallography (Crystallography of Proteins), 956
Hodgkin, Mrs. D. C. : Protein Structure and Biological Activity, 834
Hoffman, K. : Biological Rhythms (Influence of Temperature and Pretreatment on the 24-hour Motor Activity of Lizards), 1102
Hoffman, Philip, and others : The Hyaluronidase of the Leech—an Endoglucuronidase, 810
Hogbom, J. (Whitfield, G. R., and) : Radio Observations of the Comet Arend-Roland, 602
Holder, Dr. D. W. : Promoted to Deputy Chief Scientific Officer in the Scientific Civil Service, 638 ; work of, 638
Holding, D. H., and Dennis, J. P. : An Unexpected Effect in Sound Localization, 1471
Hole Formation during the Diffusion of Zinc from Brass *in vacuo* : Effect of Stress on (Dr. L. M. T. Hopkin), 808
Hole and Claw Defects in Graphite (Prof. A. R. Ubbelohde), 380
Holečková, E., and Sekla, Dr. B. : Anti-tumour Effect of Culture Media from Tumour-immune Spleens, 1298

Hollaender, Alexander (edited by, with the co-operation of Hendricks, Sterling B.) : Radiation Biology, Vol. 3, Visible and Near-Visible Light, *review* by Dr. Robert Hill, 108
Holland, L : X-Ray Radiation Hazard using Vacuum Deposition Plant, 89
Holland, M. F. W. : *Obituary* by Prof. Gordon Manley, 634
Holliman, Prof. F G. : Elected a Fellow of the Royal Society of South Africa, 1025
Hollingshead, R. G. W. : Oxine and its Derivatives, Vol. 3, Derivatives of Oxine, Part 1 ; Vol. 4, Derivatives of Oxine, Part 2, *review* by Dr. G. M Bennett, 57
Holloway, C. W. : Appointed assistant conservator of forests, Kenya, 1098
Holm, Lennart, and others : Discovery of Element 102, 120
Holmes, Prof Arthur : Awarded the Paul Fourmarier Prize for 1947-56 of the Royal Academy of Belgium, 316
Holmes, R. L. : The Rabbit Ductus Arteriosus, 1058
Holmes, Robert W. (Lasker, Dr. Reuben, and) : Variability in Retention of Marine Phytoplankton by Membrane Filters, 1295
Holmstrom, Dr. J. Edwin : Records and Research in Engineering and Industrial Science, third edition, *review* by R Brightman, 453
Holmyard, Dr. E J. (Philbrick, F. A., and) A Text Book of Theoretical and Inorganic Chemistry, new revised edition by Dr. E. J. Holmyard and Dr. W. G. Palmer, *review* by G Fowles, 878
Holroyd, Dr. R. : Awarded the Castner Gold Medal for 1958 of the Society of Chemical Industry, 1239
Holt, J. R , and others : Longitudinal Polarization of the Positrons from the Decay of Unpolarized Positive Muons, 751
Holtedahl, Prof. Olaf : Elected an Honorary Fellow of the Royal Society of Edinburgh, 69
Holub, Dr. A , and others : Development of Chemical Thermoregulation in Piglets, 858
Holzer, Dr. W. : Fundamental Aspects of Fibres and their Treatment for Papermaking (Morphology of Pulp Fibres), 1175
Home Civil Service Fellowships (Commonwealth Fund, New York), 585
Hominids and 'Humans,' *review* by Sir Wilfrid Le Gros Clark, 156
l'Homme : l'Instinct dans le Comportement des Animaux et de (M. Autuori, M. P Bénassy, J Benoit, R. Courrier, Ed.-Ph. Deleurance, M Fontaine, K. von Frisch, R. Gesell, P.-P. Grassé, J. B. S. Haldane, Mrs. Haldane-Spurway, H. Hediger, M Klein, O. Koehler, D. Lehrman, K. Lorenz, D Morris, H. Piéron, C-P. Richter, R. Ruyer, T.-C. Schneirla et G. Viaud), *review* by Dr P. T. Haskell, 518
Homogenate (Epiphyseal Cartilage) : Glucuronic Acid Formation in (Alessandro A. Castellani, Benedetto de Bernard and Vittorio Zambotti), 859
Homogenates (Brain) Clearing Action of Lysolecithin on (Dr. G. R. Webster), 660
Homologous Testis or Sperm · *In vitro* Demonstration of Uterine Anaphylaxis in Guinea Pigs sensitized with (Dr. Seymour Katsh), 1047
Homoserine in Bleeding Sap of Pea Plants (Dr. Janny A Bakhuis), 713
Honeybee, *Apis mellifera* L. : European Foul Brood—a Disease of the Larval, caused by a Combination of *Streptococcus pluton* (*Bacillus pluton* White) and *Bacterium eurydice* White (L. Bailey), 1214
Honey Bees in Southern Nigeria (Dr. J. Birket-Smith), 511
Honnell, Prof. P. M. : Awarded the Marconi Premium of the British Institution of Radio Engineers, 530
Hoover, Ltd. : Scholarships in Engineering, 738
Hooykaas, Dr. R : Christian Faith and the Freedom of Science, 71
Hopkin, Dr. L. M. T. : Effect of Stress on Hole Formation during the Diffusion of Zinc from Brass *in vacuo*, 808
Hopkins, Dr. H. H. : Table of the Fresnel Integral to Six Decimal Places, *review*, 6
  Awarded a grant of £2,000 from the Paul Instrument Fund, 734
Hopkins, Prof P. S. : Appointed director of the Smithsonian Institution's National Air Museum, 1098
Hopper, Dr P. K (Valentine, Dr. R. C , and) : Polyhedral Shape of Adenovirus Particles as shown by Electron Microscopy, 928
Hops at Wye College : Progressive *Verticillium* Wilt of, 786
Hopsu, V , and others : Effect of Prolonged Administration of Reserpine on the Endocrine Glands of the Rat, 1130
Hopton, G. U. : Chemical Engineering Education (Methods of Training), 126
Horizontal Force near the Magnetic Equator . Variation of the (Prof. N. S. Alexander and C. A. Onwumechilli), 191
Hormone (α-Melanocyte-stimulating) : Amino-Acid Sequence of the (Dr. J. Ieuan Harris and Dr. Aaron B. Lerner), *erratum*, 316
Hormone (Florigenic), in the Strawberry (C Sironval), 72
Hormone (Ovarian Development), in *Aedes aegypti* : Variation in the Time of Release of the (Dr J. D. Gillett), 656
Hormone (Parathyroid) : Chemical Nature of (Howard Rasmussen and Roland Westall), 1429
Hormones in Gestation, *review* by Prof. R. A McCance, 256
Hormones (Hen Gonadotrophic) : Action of Ethylene Dibromide on (Dr. Eugenia Olomucki), 1358
Hormones, Brain Function and Behaviour—Proceedings of a Conference on Neuroendocrinology, New York, 1956 (edited by Hudson Hoagland), *review* by Dr. Marthe Vogt, 304
Horne, Dr. J. : The Technische Hochschulen of Western Germany, 1445
Horne, R. W., and Ottewill, Dr R. H. : Electron Microscope Studies on Colloidal Silver Iodide employing Cinematographic Techniques, 910
Horner, F : Radio Noise from Planets, 1253
Horning, Prof E. S : Biological Aspects of Cancer (Two Types of Cancer which arise spontaneously in both Animals and Man), 830
Horrer, Paul L., and others (edited by) · Oceanic Observations of the Pacific, 1949, *review* by Dr. G. E. R. Deacon, 877
Horridge, Dr. G. A : The Co-ordination of the Protective Retraction of Coral Polyps, 421
  Responses of *Corianthus* to Stimulation, 1369
Horse Serum · Occurrence of an Amine Oxidase in (Bernadette Bergeret, Dr Hermann Blaschko and Rosemary Hawes), 1127
Horstadius, Prof. S. : Linné, djuren och människan, 743
Horsted, —, and Smidt, — : Fishery of *Pandalus borealis* in Greenland Waters, 892
Horticultural Chemistry at Bristol, 267
Horticulture : Griseofulvin in, 1171
Horton, Prof. Frank : *Obituary* by Dr. C J. Smith, 1320
Host-Livers of Tumour-bearing Animals : Choline-Oxidase Activity of (M. V. Narurkar, U. S. Kumta and M. B. Sahasrabudhe), 1128
Hotchin, J. E. . Latency and Masking in Viral and Rickettsial Infections (Studies of Lymphocytic Choriomeningitis in Mice), 788

Hughes, Dr. Arthur, and Tschumi, Pierre André : Transmission of Trophic Stimuli along Developing Nerve Fibres, 999
Hughes, A. M. : Silk Production in the Cheyletidae (Acarina : Arachnida), 815
Hughes, Dr. E. B. : *Obituary* of Dr. L. H. Lampitt, 266
  Modern Analytical Chemistry in Industry (Analysis and Food), 367
Hughes, Prof. E. D. : Solvent Effects and Reaction Mechanism, 534
Hughes, P. E., and others : Role of Organ-Specific Antigen during 4-Dimethylaminoazobenzene Carcinogenesis in the Rat Liver, 289
Hughes Medal for 1957 of the Royal Society awarded to Prof. J. Proudman, 1025, 1232
Hulsman, Dr. T. H. J., and others : Amino-Acid Composition of Adult and Foetal Myoglobin of the Cow, 239
  Myoglobins from Sheep Homozygous for Different Haemoglobin Types, 240
  Evidence of a Second Foetal Haemoglobin in the Newborn Goat, 758
Hulme, Dr A. C : Vegetable Quality (Quinic and Shikimic Acids in Apples), 175
Hulsmann, W C., and Slater, Prof. E. C. : Relationship between the Hydrolysis of Adenosine Triphosphate and Oxidative Phosphorylation, 372
Hultqvist, Dr Bengt : The Kiruna Geophysical Observatory, Sweden, 828
Human Abortions : Determination of the Sex of, by Nuclear Sexing the Cells of the Chorionic Villi (Prof. A. C. Stevenson and R. H. McClarin), 198
Human Beings (Normal), and one Totally Colour Blind : Relation of Size of Electroretinogram to Rhodopsin Concentration in (Dr. V. Elenius and Dr. J. Heck), 810
Human Blood Coagulation and its Disorders (Dr Rosemary Biggs and Dr R. G. Macfarlane), second edition, *review* by Dr. R. A. Kekwick, 1259
Human Brain : Repetitive Property of the, as studied by the Electroencephalograph and the Method of After-images (Dr. Catherine Popov), 328
Human Carcinoma Cells : Contamination of Stock Lines of, by Pleuropneumonia-like Organisms (Dr. L. H. Collier), 757
Human Circulatory Leucocytes *in vitro* : Survival of—Life-span and Nucleic Acid Turnover (Dr. J. Malec and Dr. K. Zakrzewski), 551
Human Communication : On (Dr. Colin Cherry), *review* by J. T. Allanson and Prof. Alan S. C. Ross, 255
Human Dental Pulp Vessels : X-Ray Microscopy of (Prof. R. L. de C. H. Saunders), 1353
Human Development · The Direction of (Prof. M. F. Ashley Montagu), *review* by Prof. T S Simey, 157
Human Enamel : Mineralization of (J H Allan), 1362
Human Erythrocytes : Fractionation of, on the Basis of their Age (Ernest R Simon and Yale J Topper), 1211
Human Haemoglobin : Gene Mutations in—the Chemical Difference between Normal and Sickle Cell Haemoglobin (Dr. V. M. Ingram), 326
Human Heredity : Effect of Radiation on (*Chronicle* of the World Health Organization, Vol. 11, No. 8, Report on), 1178
Human Infants (Malnourished) · Composition of Muscle in (Dr. J. C. Waterlow and C. B. Mendes), 1361
Human Milk : Oligosaccharides of (Dr. F H. Malpress and Dr. F E. Hytten), 1201
Human Physiology and Pharmacology at Adelaide, 685

Human Problems of Industrial Communities within the Commonwealth and Empire : H.R.H. the Duke of Edinburgh's Study Conference on the (Oxford, 1956), *review* by Dr. W. H. Scott, 876
Human Red Cell Membrane : Search for a Potassium Compartment in the (A. K. Solomon, June Loucks, Daniel A. Pollen, Thomas J. Gill, 3rd., and Elizabeth Wolf), 993
Human Relations : Trades Unions, Scientific Development and (Lewis T. Wright), 1013
Human Serum β-Globulins : Variations in (Dr. O. Smithies), 1482
Human Trypanosomes : Polymorphism in (Dr. D. J. B. Wijers), 391
Human Values : Modern Science and (Prof. Everett W. Hall), *review* by Prof. J. D. Bernal, 104
Human Welfare : Plant Diseases and, *review* by F. C. Bawden, 1260
Humane Killer : Changes in the Intestinal Mucosa of the Sheep following Death by (A. M. Badawy, R. M. Campbell, Dr. D. P. Cuthbertson and B. F. Fell), 756
Humanism : Religion and, *review* by Dr. A. Macbeath, 565
Humanities with special reference to Linguistics : Outline of Glossematics—a Study in the Methodology of the (H. J. Uldall), Part I, General Theory, *review* by P. T. Geach, 878
Humanities for the Technologist (Sir Eric Ashby), 624
Humanities and Social Sciences : The Canada Council for the Encouragement of the Arts, 356
'Humans' : Hominids and, *review* by Sir Wilfrid Le Gros Clark, 156
Humason, Dr. Milton L. : Retirement as secretary of the Mount Wilson and Palomar Observatories, 360 ; work of, 360
Humbelin, Dr. R. : Awarded a Swiss Fellowship for 1957-58 by the Ramsay Memorial Trust, 316
Hume, Sir Nutcombe : Capital for Scientific Development, 307
Hume-Rothery, Dr. W. : A Note on the Writing of Scientific Papers and Theses, 736
  Appointed first Isaac Wolfson professor of metallurgy at the University of Oxford, 1321 ; work of, 1321
l'Humidité de l'air au Congo Belge : Distribution conjointe de la température et de (Dr. F. Bultot), 219
Humidity (Relative) : Effect of, on Rat Breeding and Ringtail (Leif Rein Njaa, Finn Utne and Olaf R. Braekkan), 290
Humoral Factors of the Zona Glomerulosa of the Adrenal Cortex : Control of the (A. Nagy, A. Olah and Prof. S. Karady), 1481
Humphries, Dr. E. C. : Agriculture at Cambridge, 227
  Use of Isotopes in Agriculture, 275
Hundred Years of the University of Calcutta—a History of the University issued in Commemoration of the Centenary Celebrations, *review* by Dr. Robert Aitken, 1152
Hunt, P. H., and others : Effect of Oxygen on the Carrier Life-time in Silicon, 665
Hunt, R. W. G. : Visual Problems of Colour (Colour Adaptation), 1397
Hunt, S. E. (Chick, D. R., and) : Excited Levels in Arsenic-75 produced by Radiative Capture of Protons by Germanium-74, 88
Hunter, Prof. C. G., and others : The General Radiation Syndrome—Initial Reaction in the Monkey, 1466
Hunter, Guy : Supply of Trained Men and Women, 306
Hunter, Dr. G. D., and others : Sites of the Incorporation of an Amino-acid into Proteins of *Bacillus megaterium*, 383
Hunter, Dr. R. F. : Ecology of Grasslands (The Pasture—Animal Relationship on Hill Grazings), 1175
Hunter-Jones, Philip : An Albino Strain of the Desert Locust, 236
Huntjens, F. J., and others : At the Second International Conference on Coal Science (Properties, or the Thermal Decomposition Products, of Maceral Concentrates), 418 ; (Dilatation of various blends of Coals and Coke on Heating), 419
Hurcomb, Rt. Hon. Lord : To become president of the Field Studies Council, 1028
Hurd, R. G., and Sutcliffe, Dr. J. F. : An Effect of *p*H on the Uptake of Salt by Plant Cells, 233
Hurley, Dr. Harry J. (Shelley, Dr. Walter B., and) : Experimental Evidence for an Allergic Basis for Granuloma Formation in Man, 1060
Hurst, Dr. H. E. : A Suggested Statistical Model of some Time Series which occur in Nature, 494
Huruhata, M., and others : Combined Light and Velocity Measurements of the Variable Star 12 Lacertae, 1112
Hutchings, E. E. : Appointed head of the Member Relations Department of the Electrical Research Association, 738
Hutchinson, J. S. M. : Awarded a Wellcome Fellowship for 1957-58 by the Animal Health Trust, 412
Hutner, S. H., and others : Vitamin B_{12} Distribution between Plasma and Cells, 1043
Hutter, Dr. O. F. : Chemical Transmission at Nerve Endings (Mechanisms which underlie Cardiac Inhibition by Acetylcholine or Vagal Stimulation), 628
Hutton, Prof. C. Osborne : Metamict Tantalite from Western Australia, 248
Hutton, Kenneth : Chemistry, the Conquest of Materials, *review* by G. Fowles, 352
Huxley, Dr. H. E., and others : Structure of Molluscan Tropomyosin, 1134
Huxley, Dr. Julian : The Three Types of Evolutionary Process, 454
  Religion without Revelation, new edition, *review* by Dr. A. Macbeath, 565
  Systematics of To-day (Grades as an Auxiliary Method in Taxonomy), 739
  Biological Aspects of Cancer, 830
  Christmas Lecture at the Royal Institution, 1239
Hyaluronidase of the Leech—an Endoglucuronidase (Alfred Linker, Philip Hoffman and Karl Meyer), 810
Hydraulics Research 1956—Report of the Hydraulics Research Board with the Report of the Director of Hydraulics Research, 171
Hydraulics Research Board : Report of the, with the Report of the Director of Hydraulics Research, 171
Hydrazide (Maleic), for Mammalian Tissues : The Non-Toxicity of (Dr. J. M. Barnes and Dr. P. N. Magee ; Prof. E. Boyland, Prof. A. Haddow and Prof. R. D. Passey ; Prof. W. S. Bullough, Dr. C. N. D. Cruickshank, Dr. M. H. Salaman and Prof. R. T. Williams), 62
Hydride (Gallium), and Gallium Deuteride : Band Spectrum of (H. Neuhaus), 433
Hydrocarbon Gases (Unsaturated) : Electric Strength of (Dr. A. E. D. Heylen), 703
Hydrocarbon Oxidation : Point of Attack in (R. Burt, F. B. Ebeid and Dr. G. J. Minkoff), 188
Hydrocarbons : High-Efficiency Columns for the Analysis of, by Gas-Liquid Chromatography (R. P. W. Scott and J. D. Cheshire), 702
Hydrocarbons (Polynuclear) : *Para*-Localization Energy (Free-Electron Molecular-Orbital) and Polarographic Half-Wave Potential of some (Sadhan Basu and Rama Bhattacharya), 143
Hydro-electric Power in the U.S.S.R. (Dr. A. H. M. Arnold), 177
Hydrogen : Discharges in, at the Ion Cyclotron Frequency (Dr. A. W. Bright and K. Ramanathan), 1468
Hydrogen Bomb Explosions in 1954 : Evidence relating to the Earth's Inner Core from (Prof. K. E. Bullen and T. N. Burke-Gaffney), 49
Hydrogen Bonds : Delocalization in (Prof. C. Reid and T. M. Connor), 1192
Hydrogen-Conversion Detector for Gas Chromatography (G. E. Green), 295
Hydroids : Mosaic Evolution in (Dr. J. E. Morton), 130
  Status of *Moerisia lyonsi* Boulenger and related (Dr. W. J. Rees), 445
Hydroids (Capitate), and Medusae : Evolutionary Trends in the Classification of (Dr. William J. Rees), 130
Hydrology (Section IV, Geological Sciences, of the Royal Society of Canada Symposium on), 267
Hydrolysis of Adenosine Triphosphate and Oxidative Phosphorylation : Relationship between the (W. C. Hulsmann and Prof. E. C. Slater), 372
Hydrolysis of Adenosine Triphosphoric Acid : The Free Energy of (G. E. Vladimirov, V. G. Vlassova, A. Y. Kolotilova, S. N. Lyzlova and N. S. Panteleyeva), *erratum*, 363
Hydroxamic Acids : Fungistatic Activity of some (Dr. K. Alkiewicz, Dr. Z. Eckstein, Miss H. Halweg, Dr. P. Krakówka and Prof. T. Urbański), 1204
Hydroxide Derivatives : Electron Resonance Studies of Haemoglobin Azide and (Binding in Haemoglobin Azide as determined by Electron Resonance), (J. F. Gibson and Dr. D. J. E. Ingram), 29
Hydroxides : Oriented Transformations in Iron Oxides and (Prof. J. D. Bernal, Dr. D. R. Dasgupta and Dr. A. L. Mackay), 645
Hydroxy Acids (Organic), and Silicic and Germanic Acids in Aqueous Solutions : Interaction between (E. R. Clark and J. A. Waddams), 904
Hydroxylation (Adrenal 11β-) : Inhibition of, by Ions (Dr. Gordon M. Tomkins and Patricia J. Michael), 337
Hydroxylation (C_{16}-) of Digitoxin (B. T. Brown, Prof. S. E. Wright and G. T. Okita), 607
Hydroxylation (Non-specific), of Aromatic Amino-Acids by an Insect Cuticle (Prof. R. Dennell), 1070
Hydroxyproline and Thermal Stability of Collagen (Dr. D. A. Hall and Dr. R. Reed), 243
8-Hydroxyquinoline and Pyridine-*N*-Oxide-2-Thiol : Effect of Copper and Chelating Agents on Growth Inhibition of *Aspergillus niger* by (Dr. A. Kaars Sijpesteijn, M. J. Janssen and (in part) H. M. Dekhuyzen), 505
5-Hydroxytryptamine in a Sea Anemone : Identification and Distribution of (A. P. Mathias, D. M. Ross and Dr. M. Schachter), 658
5-Hydroxytryptamine and Anaphylactic Shock (Dr. R. K. Sanyal and Dr. G. B. West), 1417
5-Hydroxytryptophan : 3,4-Dihydroxyphenylalanine and, as Reserpine Antagonists (Prof. Arvid Carlsson, Margit Lindqvist and Tor Magnusson), 1200
  Inhibitory Effect of, on Acid Gastric Secretion (A. N. Smith, J. W. Black and E. W. Fisher), 1127
Hygroscopicity of Sitka Spruce Wood : Effect of Exposure to Gamma-Rays on the (J. M. Paton and R. F. S. Hearmon), 651
Hymenomycetes : Mitosis in Vegetative Hyphae of Higher Fungi (Prof. S. R. Bose), 45
Hyper-regeneration' ('Compensatory), in the Antennae of Hemiptera (Prof. Alexander Wolsky), 1144
Hyphae (Vegetative), of Higher Fungi (Hymenomycetes) : Mitosis in (Prof. S. R. Bose), 45
Hypoglycin *A* : Effect of, on the Alpha Cells of the Pancreas (Dr. P. C. Feng), 855
Hypothalamus : A Second Oxytocin in the (P. A. Robertson and Dr. R. W. Hawker), 343
Hypothesis (A Geochemical), of the Earth's Structure (A. F. Kapustinsky), 1245
Hyslop, N. St. G. : Appointed lecturer in clinical veterinary pathology at the University of Bristol, 1171
Hytten, Dr. F. E. : Nutrition of the Very Young (Some Theoretical and Practical Difficulties in Neonatal Feeding), 949
Hytten, Dr. F. E. (Malpress, Dr. F. H., and) : Oligosaccharides of Human Milk, 1201

IBBOTSON, P. : Appointed geologist, Fiji, 21
Identical Nature of the Leucocyte Antigens detectable in Monozygotic Twins by means of Immune Iso-Leuco-agglutinins (J. Dausset and H. Brecy), 1430
Identification of Aromatic Acids in Plant Tissues by Paper Chromatography : Separation and (Dr. L. A. Griffiths), 286
Identification of Edible Oils and the Detection of Oil Adulteration by Differential Infra-red Spectroscopy (J. C. Bartlet), 1071
Identification of Leuco-Anthocyanins and the Chemistry of Condensed Tannins : Some Recent Advances in the (Dr. David G. Roux), 973
Identification of Parasites : Histological Technique for Normal and Pathological Tissues and the (H. M. Carleton, with the collaboration of R. A. B. Drury), third edition, *review* by Prof. J. Brontë Gatenby, 1079
Identification and Distribution of 5-Hydroxytryptamine in a Sea Anemone (A. P. Mathias, D. M. Ross and Dr. M. Schachter), 658
Iijima, Teiji (Hirota, Yukinori, and) : Acriflavine as an Effective Agent for Eliminating *F*-factor in *Escherichia coli K*-12, 655
Ill (Mentally) : Treatment of the, 253 ; (Dr. Donald McI. Johnson), 868 ; (The Editors), 868
Illinois Journal of Mathematics, Part 1 (University of Illinois), 70
Image (Photographic) : Intensification of the (Prof. Gerald Oster), 1275
Image Devices (Electronic), in Microscopy, 71
Images (After-) : The Repetitive Property of the Human Brain as studied by the Electroencephalograph, and the Method of (Dr. Catherine Popov), 328

INDEX

I

Images (Moving Visual), produced by Regular Stationary Patterns (Dr. D. M MacKay), 849
Immature Corn Kernels : Ethyl-3-Indoleacetate—An Artefact in Extracts of (Henry N Fukui, JoAnne E. DeVries, S. H. Wittwer and Prof. H M. Sell), 1205
Immune Iso-Leuco-agglutinins : Identical Nature of the Leucocyte Antigens detectable in Monozygotic Twins by means of (J. Dausset and H. Brecy), 1430
Immune Responses in Parasitism : Nature of (Parasitology Group of the Institute of Biology Discussion on), 637
Immunity : Non-specific (British Society for Immunology Symposium on), 640
Immunizing Power of Staphylococcal Toxin : Loss of, during Routine Toxoiding with Formalin (Dr Stephen Fisher), 1479
Immunochemistry : Lectures in (Prof. Michael Heidelberger), *review* by Prof J. R. Marrack, 257
Immuno-electrophoretic Technique : An (Dr. J. Kohn), 986
Immuno-haematology (British Society for Immunology Symposium on), 838
Immunological Tolerance in Rats to Foreign Erythrocytes : Induction of (Dr. G. J. V Nossal), 1427
Immunology (British Society for Immunology), 21
Immunology—Research and Teaching, *review* by Prof. J. R. Marrack, 257
Immunology : Fundamentals of (Prof. William C. Boyd), third edition, *review* by Prof J R. Marrack), 257
Immunology, British Society for : Symposium on Non-Specific Immunity, 640
  Autumn Meeting, 838
  Symposium on Immuno-haematology, 838
Immunology and Serology (Prof. Philip L. Carpenter), *review* by Prof. J. R. Marrack, 257
Imperial, George (Walker, Jun , Prof. P. L., and) : Structure of Graphites—Interlayer Spacings of Graphitic Carbons, 1184 ; Graphitic Character of Kish, 1185
Imperial Chemical Industries, Ltd. : Gift of £25,000 to the University of Sheffield, towards the cost of building extensions to the Departments of Chemistry and of Fuel Technology and Chemical Engineering, 122
  Pharmaceutical Division—New Research Laboratories (Dr. J Yule Bogue), 1091
Imperial College of Science and Technology, London : Appointment of Dr F D. Richardson to the chair of extraction metallurgy, 18
  Appointment of Prof. H. Ford to the University of London chair of applied mechanics, 21
  Appointment of Prof. D. Williams to the University of London chair of mining geology, 21
  Appointment of Prof. W. D. Wright to the University of London chair of technical optics, 21
  Title of reader in physics in the University of London conferred on W. R. S Garton, 122
  Expansion of the, 891
  Appointment of Dr. P T. Matthews to the University of London readership in applied mathematics, 893
Imperial Institute, London : New site for the, 314
  Removal of the Colonial Products Laboratory to new premises, 1393
Implications (Biological) : Atomic Energy and its (Sir John Cockcroft), 64
Implications (Social) of Automation, 669
Improved Persistence of Dieldrin Deposits on Sorptive Mud Surface (Ph. Gerolt), 394
Improvement (Soil), and Better Crops, *review* by Dr. A. M. Smith, 3
Impurities : Fluorescence of, 786
Imsenecki, Prof. A : Methods of Studying the Microbiology of Soils (Elective Culture Technique for the Isolation of Bacteria with specialized Nutritional Requirements), 591
Inactivated Penicillin : Lack of Growth-promoting Activity of, with Turkey Poults (J. R. Jowsey, F D Cook, H. I. MacGregor and R. M. Blakely), 923
Inactivation of Antihaemophilic Globulin by Thrombin (Dr. C. Rizza and Dr W Walker), 143
Inactivation in the Liver of the Guinea Pig : Resistance of 9-α-Fluoro-11-β-Hydroxyprogesterone to (Prof. A. Lipschutz, Dusan Jadrejevic, Santiago Figueroa and Silvia Girardi), 508
Incidence of Abnormal Haemoglobins in Jamaica (Dr. L. N. Went), 1131
Incidence of Neoplasms in the Mammary Tissue of the Rat : Influence of Hexanitrodiphenylamine on the (G. J. van Esch, H. H. Vink and H van Genderen), 509
Incorporation of an Amino-acid into Proteins of *Bacillus megaterium* : Sites of the (Dr. G. D. Hunter, Dr. A. R. Crathorn and Prof. J. A. V. Butler), 383
Incorporation of Labelled Precursors into Deoxyribonucleic Acid : Lack of Differential Radiation Effect on (L. G. Lajtha), 1048
Incorporation of Phosphorus-32 into Salivary-type Chromosomes which exhibit 'Puffs' (Julian D. Gross), 440
Incorporation (Intracellular), of Iron-59 into the Root Cells of *Pisum* (J. V. Possingham and R Brown), 653
Index (A Performance), for Gas Chromatographic Columns (Marcel J. E. Golay), 435
India : Economics of Atomic Power Development in, and the Indian Atomic Energy Programme (Dr. H. J. Bhabha), 1382
Indian Atomic Energy Programme Economics of Atomic Power Development in India and the (Dr H. J. Bhabha), 1382
Indian Council of Agricultural Research : Scientific Monograph No 20, Classification of Citrus Fruits of Assam (S. C. Bhattacharya and S Dutta), 171
Indian Mackerel, *Rastrelliger kanagurta* (Cuv) : Differences in the Food of the Young and the Adult (K V. Narayana Rao and Dr. K. Pampapathi Rao), 711
Indian Species of *Onychium* : Cytology of (P. N. Mehra and S C. Verma), 715
Indigenous Cattle (European and), in the Tropics : A Difference in the Physiology of the Large Intestine between (Dr. J. Quarterman, G. D Phillips and G. H Lampkin), 552
Individual : Amenities, Rights of the ; and the Needs of Development, 819
Individual Differences in Night-Vision Efficiency (M. H. Pirenne, F. H. C. Marriott and E. F. O'Doherty), 228
3-Indoleacetate (Ethyl-)—an Artefact in Extracts of Immature Corn Kernels (Henry N. Fukui, JoAnne E. DeVries, S. H. Wittwer and Prof. H M. Sell), 1205
Indoleacetic Acid : Probable Evolutionary Relationship of Serotonin and, and some Practical Consequences Therefrom (Dr. D. W. Woolley), 630
Indonesian Council for the Sciences, Djakarta : Establishment of the, 1028
Indonesian Museums (J. Irwin), 467
Inducible Enzymes : Simultaneous Synthesis of Two, in *Staphylococcus aureus* (Prof. H. H. Ramsey and T. E. Wilson), 761
Induction : Bases of, *review* by D. V. Lindley, 208
Induction of Immunological Tolerance in Rats to Foreign Erythrocytes (Dr. G. J. V. Nossal), 1427
Induction of Mouse Leukaemia with Purified Nucleic Acid Preparations (Dr. Esther F. Hays, Norman S. Simmons and William S. Beck), 1419
Induction of Translocations in Mice by Triethylenemelamine (B. M. Cattanach), 1364
Induction (Experimental), of the Breeding Season in a Xerophilous Bird (Dr A J. Marshall and H. J de S Disney), 647
Inductive Logic : Foundations of (Roy Harrod), *review* by D V Lindley, 208
Industrial Applications of Thermonuclear Reactions (British Association for the Advancement of Science, Section A (Mathematics and Physics), Discussion on), 780
Industrial Carbon and Graphite (Society for Chemical Industry Conference on), 316
Industrial Chemistry : Development of, *review* by Prof John Read, 723
  A History of (Dr. F. Sherwood Taylor), *review* by Prof. John Read, 723
Industrial Communities within the Commonwealth and Empire : H.R.H. the Duke of Edinburgh's Study Conference on the Human Problems of (Oxford, 1956), *review* by Dr. W. H. Scott, 876
Industrial Conference : Commonwealth, *review* by Dr. W. H Scott, 876
Industrial Fund for the Advancement of Scientific Education in Schools : Report on the, 103
Industrial High-Speed Photography (Scientific and Technical Group of the Royal Photographic Society in collaboration with the Department of Scientific and Industrial Research Conference on), 1394
Industrial Low Temperature Gas Separation : Recent Developments in (Low Temperature Group of the Physical Society and the Institution of Chemical Engineers Conference on), 270, 1028
Industrial Management : Effective (James L. Lundy), *review* by T. H. Hawkins, 1078
Industrial Psychology, National Institute of (Institute of Personnel Management and the) : Course in the Use of Statistics in Personnel Management, 220
Industrial Research : Scientific and, in Britain, 1237
Industrial Science : Records and Research in Engineering and (Dr. J. Edwin Holmstrom), third edition, *review* by R. Brightman, 453
Industrial Training in Malta : Technical Education and, 532
Industrialists : Mathematical Conference for School Teachers and, 467
Industries (Nationalized), in Britain : Reports of the, 1321
Industry : Executives in, *review* by E. F. L. Brech, 1153
  Flames and (Institute of Fuel and the British Flame Radiation Committee of the International Flame Radiation Research Foundation Symposium on), 531
  Graduates in (Political and Economic Planning), 871
  Isotopes in (Isotope School, Harwell, Course on), 122
  Management in, *review* by T. H. Hawkins, 1078
  Mathematics in, 467
  Modern Analytical Chemistry in (Scottish Section of the Society for Analytical Chemistry Congress on), 366
  Morale in (T. H. Hawkins), 694
  Operational Research and Cybernetics in (Lectures arranged by the Department of Operational Research and Cybernetics of the United Steel Companies, Ltd., in co-operation with the Sheffield College of Commerce and Technology), 72, 531
  Progress and Responsibility in, 347
  Research for (London and Home Counties Regional Advisory Council for Higher Technological Education), 785
  Significance of University Training in, 871
  Supply of Scientists and Technologists for (Dr. P. F. R Venables), 305
  Women in, 127
  The Woollen, 1170
Industry in the Western World : Co-operation in Science, Technology and 1377
Industry, Festival of Films in the Service of : Premier Award in the Films for Use in Schools Section won by 'Mirror in the Sky', 891
Industry (British) : Technical Progress in, *review* by Dr R. Beeching, 301
Industry (Engineering) : Education and Training for the (Sir David Anderson), 482
Industry (Fishing) : Committee of Inquiry into the (Ministry of Agriculture, Fisheries and Food and the Scottish Home Department), 1171
Industry and Research : The Microscope in (W. Watson and Sons, Ltd., Exhibition on), 787
Industry and Technical Progress—Factors Governing the Speed of Application of Science, (Prof. C. F. Carter and Prof. B. R. Williams), *review* by Dr. B. Beeching, 301 ; 305
Ineffectiveness of Selenium in the Treatment of Nutritional Muscular Dystrophy in the Rabbit (Prof H. H Draper), 1419
Infant Animal (British Association for the Advancement of Science, Sections I (Physiology and Biochemistry) and M (Agriculture), Joint Discussion on), 681
Infants (Malnourished Human) : Composition of Muscle in (Dr. J. C. Waterlow and C. B. Mendes), 1361
Infection by Anaerobes, *review* by Prof. R. Knox, 1152
Infection with *Leptospira pomona* : Susceptibility of the Hedgehog (*Erinaceus europaeus*) to (Dr. W. Maurice Webster), 1372
Infection of Native *Solanum* Species by the Potato Blight Fungus (C. M. Driver), 1367
Infection with Poliomyelitis Virus : Changes in Cellular Nucleic Acids during, as studied by Fluorescence Microscopy (Dr. Esther Tenenbaum), 1044
Infection (Latent), of Rabbits by Adenovirus Type 5 (Dr. H. G. Pereira and Barbara Kelly), 615
Infections : Latent Virus (Dr C. H. Andrewes), 788
Infections (Viral and Rickettsial) : Latency and Masking in (University of Wisconsin, the Rockefeller Foundation and the Wisconsin Alumni Research Foundation Symposium on), 789
Infectivity of Influenza Virus Filaments (G. L. Ada, Beverley T. Perry and Margaret Edney), 1134

Inflammatory Œdema (Experimental), in Rats : Attempt to Transplant the Œdema Fluid of (Dr. E. Kelemen), 710
Influence of Hexanitrodiphenylamine on the Incidence of Neoplasms in the Mammary Tissue of the Rat (G. J. van Esch, H. H. Vink and H. van Genderen), 509
Influence of Ion Exchange on Size and Shape of Chain-like Polyelectrolyte Molecules (R. E. Cooper and Dr. A. Wassermann), 1072
Influence of Starvation and Glucose Load on the Activity of Liver Phosphorylase in Normal and Adrenalectomized Rats (Dr. N. Schwartz Sørensen), 857
Influenza Virus Filaments : Infectivity of (G. L. Ada, Beverley T. Perry and Margaret Edney), 1134
Information : Documentation and Dissemination of, *review* by Prof. S. I. Tomkeieff, 674
Information and Communication, 735
Information and Control, No. 1, 1097
Information Service on Psychopharmacology (Psychopharmacology Service Center of the United States National Institute of Mental Health), 735
Information Services in the Modern World, 563
Information Services (Overseas) : White Paper on, 563
Infra-red Radiation : A Possible Auroral Enhancement of, emitted by Atmospheric Ozone (Wallace B. Murcray), 139
Infra-red Solar Spectrum : Some Observations of the, from a High-flying Aircraft (J. T. Houghton, Dr. T. S. Moss, J. S. Seeley and T. D. F. Hawkins), 1187
Infra-Red Spectra of some Polypeptide and Protein Films : Optical Rotation and (Dr. A. Elliott, W. E. Hanby and B. R. Malcolm), 1340
Infra-red Spectroscopy (Differential) : Identification of Edible Oils and the Detection of Oil Adulteration by (J. C. Bartlet), 1071
Ingelstam, E. : Interference Spectroscopy, 956
Ingham, Susan E. : Elephant Seals on the Antarctic Continent, 1215
Ingold, Prof. C. K. : Introduction to Structure in Organic Chemistry, *review* by G. Fowles, 453
Ingram, Dr. D. J. E. (Austen, D. E. G., and) : At the Second International Conference on Coal Science (Recent Work on the Stable or Trapped Free Radicals detected by Electron Resonance in Coals and Carbonized Coals), 418
Ingram, Dr. D. J. E. (Gibson, J. F., and) : Binding in Haemoglobin Azide as determined by Electron Resonance—Electron Resonance Studies of Haemoglobin Azide and Hydroxide Derivatives, 29
Ingram, Dr. V. M. : Gene Mutations in Human Haemoglobin—the Chemical Difference between Normal and Sickle Cell Haemoglobin, 326
  Protein Structure and Biological Activity, 834
Inherent Character of Plant Species of Drier Habitats (Dr. M. L. R. Pettersson, S. K. F. Ellis, G. E. J. Gray and R. S. Smith), 698
Inhibition of Adrenal 11β-Hydroxylation by Ions (Dr. Gordon M. Tomkins and Patricia J. Michael), 337
Inhibition of Ascorbic Acid Oxidase by Thiourea (Dr. A. M. Mayer), 1417
Inhibition of Corrosion of Iron in Acid and Neutral Media : A Unified Theory of the Mechanism of, based on the Electrocapillary Behaviour of Ions (C. P. De), 803
Inhibition (Boric Acid), of Growth in certain Soil Micro-organisms : Reversal of (Alan M. Shefner and Betty J. Burkhardt), 1207
Inhibition (Growth), of *Aspergillus niger* by 8-Hydroxyquinoline and Pyridine-N-Oxide-2-Thiol : Effect of Copper and Chelating Agents on (Dr. A. Kaars Sijpesteijn, M. J. Janssen and (in part) H. M. Dekhuyzen), 505
Inhibition Studies (Specific), relating to the Lewis Blood-Group System (Dr. Winifred M. Watkins and Prof. W. T. J. Morgan), 1038
Inhibitor (Flower), from Late Varieties of Peas : Leaching of a (Mrs. Janet I. Sprent and Prof. H. N. Barber), 200
Inhibitor (A Growth), of *L. bulgaricus* 09 (L. Viswanathan and Prof. P. S. Sarma), 1370
Inhibitor (Phosphorylase), in Potato—Separation from Activator and Possible Relation to Chlorogenic Acid (Dr. Sigmund Schwimmer), 149
Inhibitor (Reversible), of Spermatozoan Metabolism : Carbon Dioxide as a (Prof. G. W. Salisbury and N. L. VanDemark), 989
Inhibitors of the Heparin Co-factor of Plasma : Phenols as (Dr. P. Fantl and A. G. M. Marr), 990
Inhibitors (Specific), of True- and Pseudo-Enzyme : Insensitivity of Chicken Cholinesterase to (Prof. W. Ferrari), 144
Inhibitory Effect of 5-Hydroxytryptophan on Acid Gastric Secretion (A. N. Smith, J. W. Black and E. W. Fisher), 1127
Inhibitory Factor (Growth-) : A Highly Specific, produced by certain *Acetobacter* Species (Dr. Robert Steel and Prof. Thomas K. Walker), 811
Inhibitory Fibres (Two), forming Synapses with a Single Nerve Cell in the Lobster (Dr. A. S. V. Burgen and Dr. S. W. Kuffler), 1490
Inhomogeneities in Transparent Plastic Sheet : Detection of, by a simple Schlieren Technique (H. H. Allen), 50
Initial Reaction in the Monkey : The General Radiation Syndrome— (Prof. C. G. Hunter, R. J. Munson, W. M. Court Brown and J. D. Abbatt), 1466
Initiation and Growth of Explosion in Solids (Royal Society Discussion on), 73
Injected Heparin : Clearance of, from the Blood (Prof. Harold B. Eiber and Prof. Isidore Danishefsky), 1359
Injection (Intravenous), in the Albino Rat : A Route for (Kenneth A. Pearce), 709
Inman, R. B. : High Polymer, Colloid and Surface Chemistry (Measurements of Conductivity and Transport made on Salt-free Deoxyribonucleic Acid), 961
Innervation of the Lamellibranch Muscle (A. Abraham and E. Minker), 925
Inorganic Cations : High-Voltage Paper Electrophoresis of—Alkali, Alkaline-Earth and other Metals (Dr. D. Gross), 596
Inorganic Chemistry (Theoretical and) : A Text Book of (F. A. Philbrick and Dr. E. J. Holmyard), new revised edition by Dr. E. J. Holmyard and Dr. W. G. Palmer, *review* by G. Fowles, 878
Inorganic Crystals : Observations of Dislocations in Metals and (Course of lectures at the University of Bristol), 467
Inorganic and Theoretical Chemistry : Supplement to Mellor's Comprehensive Treatise on (prepared under the direction of an Editorial Board), Supplement 2, Part 1, F, Cl, Br, I, At, including the Radiochemistry and Radiation Chemistry of the Halogens, *review* by Prof. J. R. Partington, 258
Insect Cuticle : Non-specific Hydroxylation of Aromatic Amino-Acids by an (Prof. R. Dennell), 1070
Insect Larvae (Keratin-digesting) : Toxicity of Lithium Salts to (Dr. J. R. McPhee), 1001
Insect Muscle (Glycolysing) : Accumulation of a Stable Phosphorus Compound in (Václav Kubišta), 549
Insect Ovipositor : Reinterpretation of some Basal Structures in the (G. G. E. Scudder), 340
Insecticide Resistance in *Anopheles sundaicus* (G. Davidson), 1333
Insecticides for the Control of Virus Diseases : Use of (Association of Applied Biologists Symposium on), 1454
Insecticides (Organo-phosphorus) : Ovicidal Action of (K. N. Mehrotra and B. N. Smallman), 97
Insects : Lampbrush Chromosomes in (Dr. G. P. Sharma and Ram Parshad), 147
Insensitivity of Chicken Cholinesterase to Specific Inhibitors of True- and Pseudo-Enzyme (Prof. W. Ferrari), 144
Inspection Problem : Vigilance and the (W. P. Colquhoun), 1331
Instinct dans le Comportement des Animaux et de l'Homme (M. Autuori, M.-P. Bénassy, J. Benoit, R. Courrier, Ed.-Ph. Deleurance, M. Fontane, K. von Frisch, R. Gesell, P.-P. Grassé, J. B. S. Haldane, Mrs. Haldane-Spurway, H. Hediger, M. Klein, O. Koehler, D. Lehrman, K. Lorenz, D. Morris, H. Piéron, C.-P. Richter, R. Ruyer, T.-C. Schneirla et G. Viaud), *review* by Dr. P. T. Haskell, 518
Instinct in Man in the Light of Recent Work in Comparative Psychology (Dr. Ronald Fletcher), *review* by Prof. J. Drever, 1257
Instinctive Behaviour in Animals and Man, *review* by Dr. P. T. Haskell, 518
Institut Phytopathologique Benaki : *Annales*, Nouvelle Série, Vol. 1, No. 1, 1322
Institut pour la Recherche scientifique en Afrique Centrale : Seventh Annual Report (1954), 837
Institut Français de Navigation, and others : Joint Meeting on the Avoidance of Collision by Airborne and Shipborne Means, 213
Institut National pour l'Étude agronomique du Congo Belge : Bureau Climatologique, Communication No. 14, Distribution conjointe de la température et de l'humidité de l'air au Congo Belge (Dr. F. Bultot), 219
Institute Medal of the Textile Institute awarded to G. Loasby, 1028
Instrument Society of America (Analysis Instrumentation Division) : International Symposium on Gas Chromatography, 220, 840
Instrument Technology, Society of : Special Section devoted to Data-Processing Systems, 170
Instrumentation : Nuclear (Sir John Cockcroft), 1178
Instrumentation of British 'Skylark' Rockets, 1097
Instrumentation for Gas Chromatography, 530
Instruments for Micro-Meteorological Measurements (I. F. Long), 321, *erratum*, 688
Intact Liver Cells : Isolation of (Marjorie V. Brunster and Prof. R. K. Morton), 1283
Intact Rat : Effect of Analogues on the Uptake of Vitamin B_{12} by the (Dr. A. L. Latner and Dr. Laureen Raine), 1197
Integral (Fresnel) : Table of the, to Six Decimal Places (compiled by T. Pearcey), *review* by Dr. H. H. Hopkins, 6
Integrals and other Mathematical Data : Tables of (Prof. Herbert Bristol Dwight), third edition, *review* by Dr. G. A. Garreau, 1270
Intensities : Effect of Ultra-violet Light on Mouse Skin over a Wide Range of (Prof. S. Claesson, G. Wettermark and L. Juhlin), 992
Intensification of the Photographic Image (Prof. Gerald Oster), 1275
Interaction in Ionic Solutions (Faraday Society Discussion on), 172
Interaction between Organic Hydroxy Acids and Silicic and Germanic Acids in Aqueous Solutions (E. R. Clark and J. A. Waddams), 904
Interaction (Neurotic), in Marriage (edited by Victor W. Eisenstein), *review* by Dr. Clifford Allen, 4
Interactions of Chlorophyll in its Triplet State with Oxygen, Carotene, etc. (Dr. E. Fujimori and Prof. Robert Livingston), 1036
Interatomic Distances in Benzene : Molecular Vibrations and Standard Deviation of (Prof. O. Bastiansen and S. J. Cyvin), 980
Intercellular Space Carbon Dioxide Concentration 'Γ' : Temperature Effects on the Minimum (Midday Closure of Stomata), (Dr. O. V. S. Heath and Dr. B. Orchard), 180
Interchange Organization : Sheffield, 269
Interface Adsorption (Liquid—Liquid) : Chromatography by Liquid—Liquid Partition and (H. van Duin), 1473
Interfacial Films : Reaction of Globin with Haemin in (F. Haurowitz, M. Dicks and D. G. Therriault), 437
Interference in Soil Phosphorus Analyses by Snail Shells (P. M. McDonnell), 90
Interference Microscopy : A Cell Compressor for the Measurement of Mass and Concentration by (Dr. R. J. Goldacre, Dr. D. M. Easty and Dr. E. J. Ambrose), 1487
Interference Spectroscopy : International Colloquium on (Centre National de la Recherche scientifique), 955
Interlayer Spacings of Graphitic Carbons (Prof. P. L. Walker, Jun., and George Imperial), (Structure of Graphites), 1184
Intermediates (Reactive), of Organic Chemistry (John E. Leffler), *review* by H. S. Turner, 1269
Internal Combustion Engine Research Association, British ; Appointment of Dr. W. P. Mansfield as director of research, 1237
Internal Flaws in Bonded Cylinders of Soft Vulcanized Rubber subjected to Tensile Loads (A. N. Gent and P. B. Lindley), 912
Internal Organs : Development of Multiple Cysts and of Haemorrhagic Affections of, in Albino Rats treated during the Embryonic or Newborn Period with Rous Sarcoma Virus (G. J. Svet-Moldavsky), 1299
Internal Structure of the Virus-like Particles associated with the Rous Sarcoma, and their Presence in other Neoplastic and Normal Chicken Tissues (Prof. Ch. Oberling, W. Bernhard and Ph. Vigier), 386
Internally Deposited Radiocerium : Removal of, by the Use of Chelating Agents (Dr. A. Catsch and Du Khuong Lê), 609
International Abstracts of Biological Sciences, 268
International Administration, 932
International Administration : Reflections on (A. Loveday), 933
International Association of Meteorology : Scientific Proceedings of the (Rome 1954), *review* by G. A. Bull, 107
International Association of Microbiological Societies : Funds for assisting the work of type culture collections of micro-organisms, 316

INDEX

International Astronomical Union : Transactions of the (edited by P. Th. Oosterhoff), Vol. 9, Ninth General Assembly held at Dublin, 1955, *review* by Prof R. O. Redman, 824
International Astronomy, *review* by Prof R. O. Redman, 824
International Botanical Congress : Ninth, 688
International Cancer Congress : Seventh, 688
International Collegium for Neuro-Psycho-Pharmacology : Foundation of an, 1324
International Colloquium on Interference Spectroscopy (Centre National de la Recherche scientifique), 955
International Colloquium on Optics in Metrology (International Commission for Optics), 1172
International Colloquium on Vegetable Quality : Second, 174
International Commission for Optics . International Colloquium on Optics in Metrology, 1172
International Committee on Science and Freedom : Bulletin, No 9, *Apartheid* and its threat to South Africa's Universities, 686
International Committee on Science and Freedom, in co-operation with the Association of University Teachers : Meeting in London in support of the South African Universities against *apartheid*, 686, 1163
International Conference on Coal Science : Second (Dr. I. G. C. Dryden), 417
International Conference on Combustion . Seventh (Institute of Fuel and the Combustion Institute), 531
International Conference on High Polymers at the University of Nottingham, 467
International Conference on Ionization Phenomena in Gases : Third (Società Italiana di Fisica), 790
International Conference on the Peaceful Uses of Atomic Energy : Proceedings of the (Geneva, 1955), Vol. I, The World's Requirements for Energy ; Vol 6, Geology of Uranium and Thorium, *review* by Dr. T E. Allibone, 254 ; Vol 7, Nuclear Chemistry and Effects of Irradiation ; Vol 11, Biological Effects of Radiation, *review* by Dr. T. E. Allibone, 771
  Second, 217
International Conference on Radioisotopes in Scientific Research (Unesco), 1029
International Congress of Psychology : Fifteenth (Belgian Society of Psychology under the auspices of the International Union of Scientific Psychology), 533
International Congress on Rheology : Third, 1172
International Congress of Surface Activity : Second, 225
International Congress of Zoology : Fifteenth, 688
International Co-operation in Marine Research (Dr G. E. R. Deacon), 894
International Council of Scientific Unions : 1957 Year book, 362
International Dictionary of Physics and Electronics, *review* by Dr. J. R. Tillman, 55
International Exhibition · Brussels Universal and (1958), 1322
International Flame Radiation Research Foundation (British Flame Radiation Committee), (Institute of Fuel and the) : Symposium on Flames and Industry, 531
International Geographical Union : Regional Conference in Japan, 899
International Geophysical Year (J. Wartnaby), *review* by G. A. Bull, 519
International Geophysical Year, 1957-58 · The United Kingdom Contribution to the (Royal Society), *review* by G A. Bull, 569
International Geophysical Year (Dr. M. Nicolet), 7
  Awards of the Polar Medal, 18
  Broadcast Warning Service, 120
  Nuclear Radiation Measurements during the (Dr Bert Bolin), 311
  Popular Guides to the, *review* by G. A Bull, 519
  Guide to I.G.Y.—International Geophysical Year, 1957-58 (British National Committee), *review* by G. A. Bull, 519
  Unesco and its Programme XV, *review* by G. A. Bull, 519
  Popularizing the, *review* by Dr. M. A. Ellison, 623
  Once round the Sun—the Story of the (Dr. Ronald Fraser), *review* by Dr. M. A. Ellison, 623
  Russian Earth Satellites and the, 1027
  A Bibliography for the (National Science Foundation), *review* by G. A. Bull, 1155
International Group for the Study of the Fauna of the Soil, 218
International Lunar Society, 269
International Meeting of Scientists on Hazards associated with the Development of Weapons of Mass Destruction, 358
International Meteorology, *review* by G. A. Bull, 107
International Organizations of Medical Sciences : Symposium on the Physiopathology of the Reticulo-Endothelial System (edited under the direction of B N. Halpern by B. Benacerraf and J. F. Delafresnaye), *review* by Prof. T. Nicol and D. L. J. Bilbey, 1155
International Palaeontological Union, 1452
International Scientific Radio Union : Twelfth General Assembly, 20
International Society for Bioclimatology and Biometeorology : First Congress (Dr. E. M. Glaser), 1328
International Society of Soil Mechanics and Foundation Engineering : Fourth International Conference, 270, 839
  Election of Prof. A. W. Skempton as president, 840
International Symposium on Electronic Components (Royal Radar Establishment, Malvern), 531
International Symposium on Freezing and Drying (Institute of Biology), 838
International Symposium on Gas Chromatography (Analysis Instrumentation Division of the Instrument Society of America), 220, 840
International Symposium on Macromolecular Chemistry : Proceedings of the, 1172
International Symposium on Military Psychology (United States National Academy of Sciences and the National Research Council), 534
International Symposium on the Physical Problems of Colour Television (Joint publication by *Optica Acta* and *Acta Electronica* of the Proceedings of the), 953
International Tin Research Council : Twenty-fifth Anniversary (Dr. Ernest S. Hedges), 415
International Union of Biochemistry : Symposium on the Origin of Life on the Earth, 886
International Union against Cancer : Award of Travel Grants, 738
International Union for the Conservation of Nature and Natural Resources . Proceedings of the sixth Technical Meeting, 584
International Union of Crystallography : Fourth General Assembly and International Congress, 956
  Election of J Wyart as president, 957
International Union of Geodesy and Geophysics : Tenth General Assembly, Scientific Proceedings of the International Association of Meteorology, Rome 1954, *review* by G. A. Bull, 107
  Symposium on the Abyssal Circulation of the Ocean, 733
International Union of Pure and Applied Chemistry : Symposium on Geochemistry, 583
International Union of Pure and Applied Chemistry (Macromolecular Commission) : Tenth International Symposium on Macromolecular Chemistry, 841
International Union of Pure and Applied Physics : Ninth General Assembly, 1324
  Election of the Executive Committee for 1957-60, 1324
International Union of Scientific Psychology : Fifteenth International Congress of Psychology, 533
International Wool Secretariat and Wool Bureau Review for 1956-57, 1170
Interplanetary Society, British : Realities of Space Travel—Selected Papers of the (edited by L J. Carter), *review* by Prof. D R. Bates, 453
Interspecific Competition (Charles Elton), 1002
  An Elementary Theory of (M. H Williamson), 422
Interstitial Cell (Ovarian), and the Endothelial Lining of the Blood Sinusoids: Subendothelial Space between the (Dr. M De Groodt, A. Lagasse and Prof. M Sebruyns), 1431
Intestinal Damage by Radiation and its Chemical Modification (R. H. Mole and Diana M. Temple), 1278
Intestinal Lecithinase (B. Epstein and B. Shapiro), 387
Intestinal Mucosa of the Sheep : Changes in the, following Death by Humane Killer (A. M Badawy, R. M. Campbell, Dr. D. P. Cuthbertson and B. F. Fell), 756
Intestine (Large) A Difference in the Physiology of the, between European and Indigenous Cattle in the Tropics (Dr. J. Quarterman, G. D. Phillips and G. H. Lampkin), 552
Intracellular Distribution of Catecholamines in the Brain (Dr. A. Weil-Malherbe and A. D. Bone), 1050
Intracellular Incorporation of Iron-59 into the Root Cells of *Pisum* (J. V. Possingham and R. Brown), 653
Intracellular Recording from Spinal Motoneurones following Stimulation of Medullary Pyramids (Dr. Roger Merritt Morrell), 709
Intracellular Technique : Neurophysiology and the, *review* by Prof. Ragnar Granit, 724
Intramolecular Transfer of Electronic Energy in Dihydro Diphosphopyridine Nucleotide (Dr. G. Weber), 1409
Intravenous Injection in the Albino Rat : A Route for (Kenneth A. Pearce), 709
Intravenous Methylene Blue : Treatment of Cancer in Dogs by (R. T. Pursell), 1300
Intrinsic Factor · Enhancement of Vitamin B_{12} Absorption by Substances other than (Samuel M Greenberg, John F Herndon, Edward G. Rice, Edwin T Parmelee, John J. Gulesich and Edward J. Van Loon), 1401
Intrusions (Minor), of Ayrshire . Dating of some (D. Armstrong), 1277
Invertebrate Physiology : Recent Advances in—a Symposium sponsored by the National Science Foundation, the Tektronix Foundation and the University of Oregon (edited by Bradley T. Scheer), *review* by Prof. V. B Wigglesworth, 1309
Invertebrates · Chemical Transmission of Nerve Impulses in Vertebrates and (Dr. Catherine O. Hebb), 627
  Physiology of, *review* by Prof V. B Wigglesworth, 1309
Investigation of Lung Cancer : Chemical Approaches to the (Dr. J. W. Cook), 479
Investigations : Philosophical (Ludwig Wittgenstein), translated by G. E. M. Anscombe, *review* by F. I. G. Rawlins, 399
Iodinated : Supercontraction of Wool irradiated with Ultra-violet Light or (A. R. Haly, M Feughelman and June C. Griffith), 1064
Iodine in Sea Water : State of (T. I Shaw and L. H. N. Cooper), 250
Ioffe, Dr A. F. : Fizika Poluprovodnikov, *review* by Prof R. E. Burgess, 1265
Ion Cyclotron Frequency : Discharges in Hydrogen at the (Dr. A. W. Bright and K. Ramanathan), 1468
Ion Cyclotron Resonance (Dr R. F. Saxe), 87
Ion Exchange : Influence of, on Size and Shape of Chain-like Polyelectrolyte Molecules (R. R. Cooper and Dr. A Wassermann), 1072
Ion Permeability of the Plasmalemma of the Plant Cell (N. A. Walker), 94 ; (Prof. G. E. Briggs), 1142
Ion Transport in Biological Systems : Efficiency of (Dr. J. F. Sutcliffe and D. P. Hackett), 95
Ionenphysik und Übermikroskopie : Tabellen der Elektronenphysik, (Baron Manfred von Ardenne), Band 1, Hauptgebiete ; Band 2, Hilfsgebiete, *review* by Dr. V. E. Cosslett, 1264
Ionic Solutions : Interaction in (Faraday Society Discussion on), 172
Ionization (Preferential), of Argon in the Presence of Air and its Application to Electric Discharge Devices (D. P. C. Thackeray), 913
Ionization Chambers : Guarded-Field Thimble (Dr. L. A. W. Kemp and Barry Barber), 1116
Ionization Phenomena in Gases : Third International Conference on (Società Italiana di Fisica), 790
Ionizing Radiation : Effect of, on Solid Catalysts (R. W. Clarke and E. J. Gibson), 140
  Effects of, *review* by Dr. T. E. Allibone, 771
Ionizing Radiations : Code of Practice for the Protection of Persons exposed to, 578
Ionophoretic and Chromatographic Analysis of Single Dust Particles (B. M. Turner), 1472
Ionosphere : Travelling Disturbances in the—Changes in Diurnal Variation (Dr. G. H. Munro), 1252
Ionosphere as Dynamo and Motor (Dr. D. F. Martyn), 531
Ionospheric Forward-scatter Communication : Delayed Signals in (G. W. Luscombe), 138
Ionospheric Studies by the Lunar Radar Technique (B. C. Blevis), 138
Ions : Inhibition of Adrenal 11β-Hydroxylation by (Dr. Gordon M. Tomkins and Patricia J Michael), 337
  A Unified Theory of the Mechanism of Inhibition of Corrosion of Iron in Acid and Neutral Media based on the Electrocapillary Behaviour of (C. P. De), 803

Ions ($C_6H_6^-$ and $C_7H_7^+$) . Chemical Shifts in—the Free Electron Model (J. R. Leto, F. A. Cotton and Dr. J S. Waugh), 978
Ions (Metal), and Chelating or Complexing Agents : Formation of Liesegang-like Rings by (Prof Robert E. Feeney and Nelle Bennett), 979
Ions (Sodium), and Tissue Metabolism—some Metabolic Peculiarities of Brain Tissue (Genkichiro Takagaki and Yasuzo Tsukada), 707
Ions (Sodium, Potassium and Calcium), in the Haemolymph of *Oncopeltus fasciatus* (Dallas), (Prof. James A Mullen), 813
Ipomoea . Leaf Shape, Nutrition and Temperature of (E. Njoku), 1453
Iredale, Tom . Birds of New Guinea, *review* by Dr. A. J Marshall, 673, 787
Ireland : Occurrence of *Elminius modestus* Darwin in (D. M. Beard), 1145
  Pre-Famine, a Study in Historical Geography (T. W. Freeman), *review* by J. P. Haughton, 1440
  A View of (edited by James Meenan and David A. Webb), *review*, 488
Iron : Memoirs on Steel and (R A. F. de Réaumur), a translation from the original printed in 1722, by Annelise Grunhaldt Sisco, *review* by Prof. F C. Thompson, 1263
  Preservation of, by Chromate Solutions (Miss D. M. Brasher, A. H. Kingsbury and A. D. Mercer), 27 ; (Miss D. M. Brasher and C. P. De), 28
Iron-59 : Intracellular Incorporation of, into the Root Cells of *Pisum* (J. V. Possingham and R Brown), 653
Iron in Acid and Neutral Media : A Unified Theory of the Mechanism of Inhibition of Corrosion of, based on the Electrocapillary Behaviour of Ions (C. P. De), 803
Iron Lost into and Re-absorbed from Gastro-intestinal Bleeding Lesions : Isotopic Tracer Method for Measurement of (M. Roche, M. E Perez-Gimenez and A. Levy), 1278
Iron (Rusting) · Degradation of Cellulosic Fibres in Contact with (W. A. Bell and Jean M. Gibson), 1065
Iron Oxides and Hydroxides : Oriented Transformations in (Prof. J D. Bernal, Dr. D. R. Dasgupta and Dr. A. L. Mackay), 645
Iron Pan : Corrugated (Robert Ho), 1276
Iron and Steel Engineers Group . Discussion on Water Pollution in the Iron and Steel Industry, 893
Iron and Steel Industry : Water Pollution in the (Iron and Steel Engineers Group Discussion on), 893
Iron and Steel Institute : Hatfield Memorial Lecture (Prof. Paul Bastien), 787
Iron and Steel Institute (British Iron and Steel Research Association and the) : Translation Service, 218, 316
Iron and Steel Research Association, British (South Wales Laboratories) : Research on Metal Coatings, 123
Iron and Steel Research Association, British, and the Iron and Steel Institute Translation Service, 218, 316
Irradiated Mice : Production of Rat Serum Proteins in (W. W. H. Weyzen and O. Vos), 288
Irradiation : Nuclear Chemistry and Effects of (Proceedings of the International Conference on the Peaceful Uses of Atomic Energy, Geneva 1955, Vol 7), *review* by Dr. T. E. Allibone, 771
Irradiation (Chronic) : Shortening of Life by—the Experimental Facts (R. H. Mole), 456
Irradiation (γ-ray) · Effects of, on Nematodes Infesting Cultivated Mushroom Beds (F. C Wood and J. B. Goodey), 760
Irradiation (Ultra-violet), of Dry Tobacco Mosaic Virus (Albert Siegel), 1430
Irreverre, F , and others : Occurrence of Gamma-Guanidinobutyric Acid, 704
Irving, E. : Directions of Magnetization in the Carboniferous Glacial Varves of Australia, 280
Irving, E., and others : The Geomagnetic Field in Upper Triassic Times in the United States, 1186
Irwin, J. : Indonesian Museums, 467
Ischlondsky, M. B · Biological Rhythms (Harm caused by Stimulation during 'Inhibitory Phases' of the Human Central Nervous System), 1101
Iselin, P., and others : At the Second International Conference on Coal Science (Properties, or the Thermal Decomposition Products, of Maceral Concentrates), 418
Ishiguro, S (Darbyshire, J., and) : Tsunamis, 150
Island (Aneityum), New Hebrides : Biogeographical Significance of (Miss L. E. Cheesman), 903
Island Marine Laboratories, Association of : Establishment of the, 465
  Election of Prof D. M. Steven as president, 466
Iso-Leuco-agglutinins (Immune) : Identical Nature of the Leucocyte Antigens detectable in Monozygotic Twins by means of (J. Dausset and H. Brecy), 1430
Isolated Female Larvae of the Potato-Root Eelworm (*Heterodera rostochiensis* Woll.) : Development of (T. D Williams), 1000
Isolated Lucerne : Fractionation of, and other Triterpenoidal Saponins (Dr. C. B. Coulson), 1297
Isolation of 2-Aminoethanesulphinic Acid from a Mollusc (Shun'ichi Shibuya and Shunji Ouchi), 549
Isolation of the Bound Form of Nicotinic Acid (Prof. B. C. Guha and M. L. Das), 1285
Isolation of Crustacean Chitin : Application of Ethylenediaminetetra-acetic Acid in the (Dr A B Foster and R H Hackman), 40
Isolation of 3:4-9:10-Dibenzopyrene from Coal-Tar (Dr. R. Schoental), 606
Isolation of Intact Liver Cells (Marjorie V. Branster and Prof. R. K. Morton), 1283
Isolation of *Leptotrichia buccalis* and *Fusobacterium* Species from Oral Material (A. C. Baird-Parker), 1056
Isolation of Uranediol from the Urine of Pregnant Mares (W. L. Glen, R Barber and G A. Grant), 288
Isolation and Cultivation of Zooxanthellae (Dr. Paul A Zahl and John J. A. McLaughlin), 199
Isotope School, Harwell . Course on Isotopes in Industry, 122
Isotopes in Agriculture Use of (Dr. E. C Humphries), 275
Isotopes in Industry · Course on (Isotope School, Harwell), 122
Isotopes (Carbon) : Bibliography for 1953 and 1954 of Syntheses of Compounds containing (J. C Nevenzel, D. R. Howton, R. F. Riley and G. Steinberg), 636
Isotopes (Water-soluble), of Short Half-life : Demonstration of Early Renal Uptake of Potassium-42 by an Autoradiographic Method for (Dr. V. D Essen and Dr. F. T. C. Harris), 440
Isotopes and Radiation in Agricultural Research : Uses of (Report of the First Meeting of the European Contact Group, Wageningen, 1956), (Food and Agriculture Organization of the United Nations), 275
Isotopic Tracer Method for Measurement of Iron Lost into and Re-absorbed from Gastro-intestinal Bleeding Lesions (M Roche, M. E. Perez-Gimenez and A. Levy), 1278

Laurence, D. J. R., and others : Molecular Weights and Physical Properties of Deoxyribonucleic Acid, 1340
Laurence, Dr. Edna B. (Bullough, Prof. W S., and) : Biology of Hair Growth (Mitotic Activity of the Follicle), 593
Laurila, Ulla-Riitta, and others : Phosphodiesterase from Rattle-snake Venom, 1181
Lavee, S. : A Physiological Effect of Triethanolamine on the Development of *Sclerotium rolfsii* (Sacc), 1494
Lavergne, Dr. D. : Methods of Studying the Microbiology of Soils (Methods of Counting Soil Bacteria), 592
Lavoisier : Oeuvres de (recueillie et annotée par René Fric), Fascicule 2, 1770-1775, *review* by Sir Harold Hartley, 1260
Lavoisier's Letters, *review* by Sir Harold Hartley, 1260
Lavollay, Prof. J. : Vegetable Quality (Coupled Destruction of Ascorbic Acid by the Action of Phenolase on certain Orthodihydroxy Flavonoids), 175
Lavrenčić, B. · At the Second International Conference on Coal Science (Rheological Properties of Yugoslav Coals when Heated), 419
Law, J. P. : Appointed agricultural officer, Sierra Leone, 413
Law : The Economics of Nuclear Power including Administration and (edited by J. Guéron, J. A. Lane, I. R. Maxwell and J. R. Menke), Vol I, *review* by C. A Rennie, 673
Law relating to Mental Illness and Mental Deficiency, Royal Commission on the : Report for 1954-57, 253
Lawendel, Dr. J. S. : Ultra-Violet Absorption Spectra of L-Ascorbic Acid in Aqueous Solutions, 434
Lawrence, Dr. L. J. : Given an award under the Royal Society and Nuffield Foundation Commonwealth Bursaries Scheme, 119
Lawson, J. D. : Power from Nuclear Fusion, 780
Industrial Applications of Thermonuclear Reactions (Basic Physics of the Reaction Process and the Properties of the Hot Gas), 780
Lazarev, B. G., and Sudovtsov, A I. : Low-Temperature Physics (Volume Change in Tin and Lead when Superconductivity is established in a Magnetic Field), 461
Lazarev, B G., and others : Low-Temperature Physics (Influence of Pressure on the de Haas—van Alphen Effect), 461
Lê, Du Khuong (Catsch, Dr. A., and) : Removal of Internally Deposited Radiocerium by the Use of Chelating Agents, 609
Le Feuvre, Sgt. C. F. : Awarded the Polar Medal, 18
LeGrand, Y. : Visual Problems of Colour (Essentials of all Colour Theories), 1397
Le Poidevin, N. : Appointed agricultural officer, Gambia, 413
Lea, Norman : Further Radio Observations of the First Satellite, 943, *erratum*, 1172
Leach, A. A. (Eastoe, J. E., and) : Recent Advances in Gelatin and Glue Research (Amino-acid Composition), 691
Leach, Dr. Samuel A., and others . Fluoride Removal by Powdered Dental Enamel from Solutions of Stannous or of Sodium Fluoride, 1421
Leach, T M. : Appointed chief veterinary officer, Northern Nigeria, 1098
Leaching of a Flower Inhibitor from Late Varieties of Peas (Mrs. Janet I. Sprent and Prof. H. N. Barber), 200
Lead Tolerance in Plants : A Technique for the Measurement of (D. A. Wilkins), 37
Leaf Roll Virus : Potato Blight and (D E. Richardson and D. A Doling), 866
Leaf Rust : Effect of, on Cereal Forage (A. F Greenall), 1000
Leaf Shape, Nutrition and Temperature of *Ipomoea* (E. Njoku), 1453
Leaf Surfaces · Electron Microscopy of (D. E. Bradley and B. E. Juniper), 330
Leaf Wax : Solubilization of Copper by Leaves and Water-soluble Acids from (Defence Mechanism of Plants against Fungi), (Dr. J. T. Martin and E Somers), 797
Leaf Wax (Apple) : Fungistatic Properties of (Defence Mechanism of Plants against Fungi), (Dr. J. T. Martin, R. F. Batt and R. T. Burchill), 796
Leak, H. J. . Awarded the Dr. Norman Partridge Memorial Award of the British Institution of Radio Engineers, 530
Leakage Field (Magnetic), in Cobalt : Study of the, by means of a Divergent Electron Beam (Dr. M Blackman and E. Grunbaum), 1189
Learning : The World of, 1957, eighth edition, *review*, 878
Leather Trades' Chemists, Society of : Annual Conference, 270
Anniversary Lecture (K. B Ross), 270
Leaves : Sorption of Copper from Burgundy Mixture by (Defence Mechanism of Plants against Fungi), (E. Somers and D V. Richmond), 798
Leaves of Crop Plants : Rapid Estimation of the Areas of the (Dr. P. C. Owen), 611
Leaves (Detached Wheat) : Effect of Benzimidazole on (Dr. Clayton Person, Dr. D. J. Samborski and Dr. F. R. Forsyth), 1294
Leaves (Green) : A Carotene-Protein Complex isolated from (Mitsuo Nishimura and Ken Takamatsu), 699
Leaves (Submerged) : Water Absorption by (T R. Milburn), 1368
Leaves (Tobacco) · Effect of Ultra-Violet Radiation on the Respiration-Rates of, and its Reversal by Visible Light (Dr P. C. Owen), 610
Leaves and Water-soluble Acids from Leaf Wax : Solubilization of Copper by (Defence Mechanism of Plants against Fungi), (Dr. J. T. Martin and E. Somers), 797
Lebedev, V I. (Belov, N. V , and) : Solar Energy and the Depth of the Earth, 1324
Lebistes reticulatus (Viviparous Fish) · Hermaphroditism and Self-Fertilization, and the Monthly Extrusion of Unfertilized Eggs, in the (Dr. H. Spurway), 1248
Lecithin (Radioactive), and Radioactive Cephalin with Lipositol : Quantity of, required to produce Sphering of Mammalian Red Cells (Dr Eric Ponder and Ruth V. Ponder), 814
Lecithinase : Intestinal (B Epstein and B. Shapiro), 387
Lecture Experiments in Chemistry (G. Fowles), fourth edition, *review* by A C Cavell, 878
Lectureships : Perkin Exchange, 787
Lederer, Prof. Edgar, and Lederer, Michael : Chromatography, a Review of Principles and Applications, second edition, *review* by Dr. R. Consden, 773
Lederer, Michael (Lederer, Prof. Edgar, and) : Chromatography, a Review of Principles and Applications, second edition, *review* by Dr. R. Consden, 773
Lederle Travelling Fellowship in Medicine (Medical Research Council Award for 1957-58), 315
Ledoux, L., and others : Relation between Ribonuclease Activity and Ribonucleic Acid Content, 1048
Lee, Prof Alan : Appointed professor of electrical engineering (radar and telecommunications) at the Royal Military College of Science, Shrivenham, 1026 ; work of, 1026
Leech : The Hyaluronidase of the—an Endoglucuronidase (Alfred Linker, Philip Hoffman and Karl Meyer), 810
Leeds : A Geological Garden constructed at (Dr. D E. Owen), 19
Leffler, Dr. J. E. : Solvent Effects and Reaction Mechanism, 535
The Reactive Intermediates of Organic Chemistry, *review* by H. S. Turner, 1269
Légion d'Honneur : Cross of Chevalier in the French National Order of the, awarded to Sir Solly Zuckerman, 1239
Legumes : A New Thiol in (Dr. C A. Price), 148
Lehman, Dr. A. J. (Larrick, G. P., and) : Control of Chemical Additives in Food, 692
Lehmer, Derrick Norman : Factor Table for the First Ten Millions, containing the Smallest Factor of Every Number not Divisible by 2, 3, 5 or 7 between the Limits 0 and 10,017,000, *review* by Dr. J. C. P. Miller, 520
List of Prime Numbers from 1 to 10,006,721, *review* by Dr. J. C. P. Miller, 520
Lehrman, D , et autres : l'Instinct dans le Comportement des Animaux et de l'Homme, *review* by Dr. P T. Haskell, 518
Leishmania donovani, the Causative Organism of Kala-azar : Transaminases of (Dr. A. N Chatterjee and Dr J. J. Ghosh), 1425
Leitz, Ernst : 500,000th Microscope presented to Prof Paul A. Weiss, 1095
Lemche, Dr. Henning : Supposed Asexual Reproduction in Trilobites, 801
Lempfert, R G K. : *Obituary* by E Gold, 359
Length : The Units of Time and (Dr. L. Essen), 137
Lenk, R. S. . Rheology of Disperse Systems (Viscosity Measurements), 958
Lennuier, R. : Interference Spectroscopy, 956
Leone, Charles A., and others : Role of Structural Degradation in the Loss of Serological Activity of Ovalbumin irradiated with Gamma-Rays, 1423
Lepidurus arcticus (Pallas) in the British Isles : Late-Glacial Finds of (G. F. Mitchell), 513
Leprosy Patients : Autoradiographic Detection of Sulphone in the Affected Tissues of (R. K. Poddar and Dr. K. R. Chatterjee), 854
Leptospira pomona : Susceptibility of the Hedgehog (*Erinaceus europaeus*) to Infection with (Dr. W. Maurice Webster), 1372

Leptospira Antibody Production by Bovine Foetuses (K. L. Fennestad and C. Borg-Petersen), 1210
Leptotrichia buccalis and *Fusobacterium* Species : Isolation of, from Oral Material (A. C. Baird-Parker), 1056
Lepus europaeus (Hare) : An Attempt to Cross the Domestic Rabbit (*Oryctolagus cuniculus*) and (Dr. C. E. Adams), 853
Lerner, Dr. Aaron B (Harris, Dr. J Ieuan, and) : Amino-Acid Sequence of the α-Melanocyte-stimulating Hormone, *erratum*, 316
Lesions (Cerebral) . Effect of, upon Œstrus in Ferrets (J. Herbert and Sir Solly Zuckerman), 547
Lesions (Gastro-intestinal Bleeding) : Isotopic Tracer Method for Measurement of Iron Lost into and Re-absorbed from (M Roche, M. E. Perez-Gimenez and A. Levy), 1278
Leslie, C. M. : Appointed scientific officer, East African Industrial Research Organization, East Africa High Commission, 220
Leslie, Miss Patricia R. R. : Awarded a Robert Cormack Bequest Fellowship in Astronomy by the Royal Society of Edinburgh, 122
Lessing, Dr. R. · The Primary Sources of Air Pollution (Presidential Address at the Annual Conference of the Smoke Abatement Society), 637
Lesson : The Second—Seven Years at the United Nations (Bernard Moore), 933
Lethal Effects on Plant Cells of Fungal and Bacterial Extracts (S. G. Fushtey), 20
Lethal Mutations : Autonomous Action of, induced in the Germ Cells of *Drosophila melanogaster* by 2-Chloroethyl Methanesulphonate (C. E. Purdom), 81
Lethal Radiation Effects . Absence of, following Massive Oral Administration of Plutonium (Maurice F. Sullivan and Dr. Roy C. Thompson), 651
Lethal Temperature (Ultimate Upper) : Relation between the, and the Temperature-range for Good Health in the Roach (*Rutilus rutilus*), (Dr. A W. Cocking), 661
Lethality for Guinea Pigs of Ultrasonic Extracts of *Pasteurella pestis*—its Relationship to Death of Guinea Pigs from Plague (J. Keppie, H. Smith and E. C. Cocking), 1136
Lethality (Radiation), and Local Tissue Damage in Histamine-depleted Rats (H A. S. van den Brenk), 1467
Leco, J. R , and others : Chemical Shifts in $C_5H_5^-$ and $C_7H_7^+$ Ions—the Free Electron Model, 978
Letort, Prof. M. : At the Second International Conference on Coal Science (A New Type of Adsorption Isotherm (Methane on Graphite)), 419
Letters : Lavoisier's, *review* by Sir Harold Hartley, 1260
Lettvin, J Y , and others : Membrane Currents in Clamped Vertebrate Nerve, 1290
Leuco-agglutinins (Immune Iso-) : Identical Nature of the Leucocyte Antigens detectable in Monozygotic Twins by means of (J. Dausset and H Brecy), 1430
Leuco-Anthocyanins : Some Recent Advances in the Identification of, and the Chemistry of Condensed Tannins (Dr David G. Roux), 973
Leucocyte Antigens detectable in Monozygotic Twins by means of Immune Iso-Leucoagglutinins : Identical Nature of the (J. Dausset and H. Brecy), 1430
Leucocytes *in vitro* (Human Circulatory) : Survival of—Life-span and Nucleic Acid Turnover (Dr. J. Malec and Dr. K. Zakrzewski), 551
Leukaemia (Experimental) : Silvina Estrada de Acevedo Fellowship for Research in, 530
Leukaemia (Mouse) : Induction of, with Purified Nucleic Acid Preparations (Dr. Esther F. Hays, Norman S. Simmons and William S. Beck), 1419
Levesque, Father : Our Debt to the Future (Human Values and the Evolution of Society), 260
Levine, Dr D. (Rice, Dr. F A. H., and) : Initiation and Growth of Explosion in Solids (Studies on the Oxidation induced by Ultrasonic Radiation on a Solid System of Lauryl Aldehyde and Potassium Chlorate), 74
Levvy, Dr G. A., and Marsh, C. A. : Action of Copper on Mammalian β-Glucuronidase, 197
  Purification of β-Glucuronidase from Female Rat Preputial Gland, 919
Levy, A., and others : Isotopic Tracer Method for Measurement of Iron Lost into and Re-absorbed from Gastro-Intestinal Bleeding Lesions, 1278
Levy, A. Harold : *Obituary* of Sir John Parsons, 889
Levy, Dr. P. W. (Dreyfus, Dr. R. W., and) : Initiation and Growth of Explosion in Solids (Lamellar Twinning and Decomposition in Potassium Azide and Sodium Azide), 74
Lewin, L., and others : Xanthine Oxidase Activity during Mammary Carcinogenesis in Mice, 763
Lewin, R., and others : Xanthine Oxidase Activity during Mammary Carcinogenesis in Mice, 763
Lewis, Dr. · Solvent Effects and Reaction Mechanism, 534
Lewis, B., and others : Effect of Different Dietary Fats on the Faecal End-Products of Cholesterol Metabolism, 923

Linton, Prof. David L. : The Everlasting Hills (Presidential Address to Section E (Geography), of the British Association for the Advancement of Science), 481

Lipaemia (Alimentary), and Resistance to Altitude Anoxia (Bedřich Mosinger and Eduard Kuhn), 1140
Lipid Globules in Cells (Dr. John R. Baker), 947
Lipid Material in Bone and Teeth in Experimental Chronic Fluorosis (Gertrud Lindemann), 926
Lipoprotein : Elastin, a Metabolically Active (Dr Frank S. Labella), 1360
Lipositol Quantity of Radioactive Lecithin and Radioactive Cephalin with, required to produce Sphering of Mammalian Red Cells (Dr. Eric Ponder and Ruth V. Ponder), 814
Lipotropic Action of Ethyl Trichloracetate (Dr C. C. Kratzing and Dr. G M Windrum), 859
Lippmann, Dr Fritz A. Appointed member and professor of the Rockefeller Institute for Medical Research, New York, 270
Lipschutz, Prof A , and others : Resistance of 9-α-Fluoro-11-β-Hydroxyprogesterone to Inactivation in the Liver of the Guinea Pig, 508
Lipscomb, Dr A. G. : Quality Control of Food (Quality Control Methods in the Chocolate and Confectionery Industry), 1326
Lipsett, F. R. : Energy Transfer in Polyacene Solid Solutions, 786
Lipson, H. : At the meeting of the Teaching Committee of the International Congress on Crystallography (Importance of Fourier Transforms), 957
Liquid-Crystal Phases of the Soap—Water System . Structure of the—Middle Soap and Neat Soap (Dr. V. Luzzati, H. Mustacchi and A. Skoulios), 600
Liquid-Crystalline Structures in Polypeptides (Dr. Conmar Robinson and J. C. Ward), 1183
Liquid-Fuel Firing (1948-1959) : Major Developments in (Institute of Fuel Residential Conference on), 531
Liquid—Liquid Interface Adsorption : Chromatography by Liquid—Liquid Partition and (H van Duin), 1473
Liquid—Liquid Partition and Liquid—Liquid Interface Adsorption . Chromatography by (H van Duin), 1473
Liquid Medium (Sterile) : A Technique for Obtaining Clone Cultures of Soil Amoebae in (D Harrison), 1301
Liquid Metals on Solid Metal Surfaces : Wetting and Spreading of (Department of Industrial Metallurgy, University of Birmingham, Joining of Metals Conference on), 72, 1156
Liquid Mixtures (Binary) Excess Volumes in, of Simple Molecules (R. A. H. Pool and L A K Staveley), 1118
Liquid Sulphur Dioxide : Reaction of Nitrates with (Dr K J. Ivin), 90
Literature : Russian Scientific and Technological (Department of Scientific and Industrial Research Lending Library Unit collection of), 1169
  Searching the (M. A. Short), 736
  Zoological (1954), *review* by Dr. Edward Hindle, 935
Literature (Russian Scientific) Availability of, 1451
Lithium Salts Toxicity of, to Keratin-digesting Insect Larvae (Dr J. R. McPhee), 1001
Little, A. G., and others Correlation between Photons, in Coherent Beams of Light, detected by a Coincidence Counting Technique, 324
Litwack, Prof. Gerald (Schwartz, Heinz G , and) : A Photometric Method for Avian Liver Xanthine Dehydrogenase, 761
Liver of the Guinea Pig . Resistance of 9-α-Fluoro-11-β-Hydroxyprogesterone to Inactivation in the (Prof. A Lipschutz, Dusan Jadrejevic, Santiago Figueroa and Silvia Girardi), 508
Liver of Rats Influence of Post-Irradiation Administration of Methionine on the Levels of Deoxyribonucleic Acid in Bone Marrow, Spleen and (M. K Nerurkar, A. J. Baxi, N. S. Ranadive, M. V. Narurkar and M. B. Sahasrabudhe), 193
Liver (Rat) : Role of Organ-Specific Antigen during 4-Dimethylaminoazobenzene Carcinogenesis in the (P. E. Hughes, C. J. Louis, J. K. Dineen and W. G Spector), 289
Liver Cells after Partial Hepatectomy : Deoxyribonucleic Acid Content of the Nucleus of (R Laquerrière), 1199
Liver Cells (Intact) : Isolation of (Marjorie V. Branster and Prof. R K. Morton), 1283
Liver Phosphorylase in Normal and Adrenalectomized Rats : Influence of Starvation and Glucose Load on the Activity of (Dr. N Schwartz Sørensen), 857
Liver Xanthine Dehydrogenase (Avian) : A Photometric Method for (Heinz G. Schwartz and Prof Gerald Litwack), 761
Liverpool Central Public Libraries : Centenary of the Brown Library and its Satellites, 1857-1957 (Dr G. Chandler), 20
Livesley, R K. : An Introduction to Automatic Digital Computers, *review* by Dr A. D. Booth, 1009
Living Seedlings : Germination of Oospores of *Pythium mamillatum* in Response to Exudates from (Richard Barton), 613
Livingston, Prof Robert (Fujimori, Dr E , and) : Interactions of Chlorophyll in its Triplet State with Oxygen, Carotene, etc , 1036
Llewellyn, Dr. D. R. : Appointed professor of chemistry at Auckland University College, New Zealand, 69 ; work of, 69
Llewellyn, J : Research in Marine Biology (Larvae of Monogenetic Trematodes from Plymouth Fishes), 745
Llewellyn, Dr P. M. : Appointed lecturer in physics at the University of Bristol, 1171
Llewellyn-Jones, F. : Ionization Phenomena in Gases (Recent Investigations on Micro-arc Discharges), 792
Lloyd, Dr. Blodwen : Plastic Mounts for Biological Display, 737
Lloyd, L. A. M Appointed vice-principal, Kingston Technical School, Jamaica, 1454
Lloyd-Evans, Prof. B J : Title of professor emeritus in the University of London conferred on, 220
Loads (Tensile) : Internal Flaws in Bonded Cylinders of Soft Vulcanized Rubber subjected to (A. N. Gent and P B Lindley), 912
Loasby, G : Awarded the Institute Medal of the Textile Institute, 1028
Lobster : Two Inhibitory Fibres forming Synapses with a Single Nerve Cell in the (Dr. A S. V Burgen and Dr. S W. Kuffler), 1490
  Visual Pigment of a Decapod Crustacean, the (Prof George Wald and Dr. Ruth Hubbard), 278
Local Electrode Potentials : Study of Strain Distribution in Metals by the Determination of (Prof. Hugh O'Neill and Dr. D. Eurof Davies), 498
Local Tissue Damage in Histamine-depleted Rats Radiation Lethality and (H A S van den Brenk), 1467
Localization of Radioactive and Stable Heavy Nuclides in Ocean Sediments (G. Arrhenius, M. N Bramlette and E Picciotto), 85
Localization (Cytochemical), of Acid Phosphatase in *Trichonympha turkestanica* Bernstein (Trichonymphina, Trichonymphidae), (M. M. El Mofty), 1367
Localization (Sound) : An Unexpected Effect in (D. H. Holding and J P. Dennis), 1471
Localization Energy (Group), and Polarographic Half-Wave Potentials of Aromatic Nitro Compounds (Dr Sadhan Basu and Jayanti Nag Chaudhuri), 1473
Locating Amino-acids : A Non-Destructive Technique for (E R. Cook and M. Luscombe), 708
Location of Alpha-2-Globulin by Demonstration of Alkaline Phosphatase during Paper Electrophoresis (Dr William Quitman Wolfson), 550
Lochnera rosea : Anthocyanidins of (Dr. W. G. C. Forsyth and N. W. Simmonds), 247
Lochte-Holtgreven, Prof. W : Ionization Phenomena in Gases (The Emission of Spectral Lines from a Plasma), 791
Lockspeiser, Sir Ben Supply of Trained Men and Women, 305
Lockyer (Norman) Observatory of the University of Exeter : Appointment of D R Barber as superintendent, 738
Locust ('Asynaptic') : Distribution of Chiasmata in an (Dr H Rees), 559
Locust (Desert) An Albino Strain of the (Philip Hunter-Jones), 236
  Sclerotization and Melanization—Two Independent Processes in the Cuticle of the (Dr. S. R A. Malek), 237
Lodge, Dr A. S Recent Advances in High Polymer Physics, 75
Lodge, G A. The Infant Animal (The Nutrition of the Young Pig), 681
Logan, W E. M. : Appointed deputy chief conservator of forests, Uganda, 21
  Appointed chief conservator of forests, Uganda, 1454
Logan, W R. : Spiral Crystals of Meconin, 1412
Logarithms to the Base 2 : Use of, in Recording Serological Reactions (John W. Vennes, Russell E MacDonald and Philipp Gerhardt), 1363
Logic (Inductive) : Foundations of (Roy Harrod), *review* by D V. Lindley, 208
Logie, Dr H F., and Urlau, R R. : A Surface Electroluminescence Effect in Diamonds, 1254
London (Fritz) Award given to Dr Nicholas Kurti, 467
London Hospital Medical School : Appointment of Dr. F. R. Johnson to the readership in anatomy, 316
London School of Economics and Political Science Appointment of Dr. M. Freedman to the University of London readership in anthropology, 220
  Appointment of S. J. Gould to the University of London readership in social institutions, 220
  Title of reader in sociology in the University of London conferred on E A. Gellner, 316
London School of Hygiene and Tropical Medicine : Appointment of Dr. P. L. de Roux to the University of London readership in medical parasitology, 220
London School of Tropical Medicine, *review* by Prof T H. Davey, 205
London and Home Counties Regional Advisory Council for Higher Technological Education : Bulletin of Special Courses in Advanced Technology, 635
  Research for Industry, 785
Long, I F : Instruments for Micro-Meteorological Measurements, 321, *erratum*, 688
Long Ashton Agricultural and Horticultural Research Station : Annual Report for 1956, 1400
  Retirement of Prof. T. Wallace as director, 267
  Appointment of Dr. H. G H Kearns as director, 585, 685
Long-Day Conditions : Flowering of *Xanthium* under (D de Zeeuw), 558
Long Life : Micelles of—a Step towards Biological Organization (Dr. T. Nash), 188
Longitudinal Polarization of the Positrons from the Decay of Unpolarized Positive Muons (G. Culligan, S. G F. Frank, J R Holt, J. C. Kluyver and T. Massam), 751

  Organization—the Framework of (E. F. L. Brech), *review* by Rosemary Stewart, 621
Management, British Institution of: Twelfth National Conference (Research—a Signpost to Better Management), 270
Management, British Institute of, and the Manchester College of Science and Technology: Company Executive Development Scheme, a Survey in North-West England, 153
Management in Industry, *review* by T. H. Hawkins, 1078
Management (Labour), on the Farm (European Productivity Agency of the Organization for European Economic Co-operation Report), 1461
Management Approach to Electronic Digital Computers (J. Sandford Smith), *review* by Dr. A. D. Booth, 823
Management Organization, *review* by Rosemary Stewart, 621
Management Sciences, Institute of (New York), and others: Conference on Operational Research, 363, 1087
Manchester College of Science and Technology: Appointment of Prof. W. E. Morton as vice-principal and Arkwright professor of textiles, 169
  Appointment of J. J. Vincent to the chair of textile technology, 169
  Exhibition of Laboratory Apparatus and Techniques, 1239
Manchester College of Science and Technology (British Institute of Management and the): Company Executive Development Scheme, a Survey in North-West England, 153
Manchester Literary and Philosophical Society: Election of Officers for 1957-58, 219
Manchester Museum: Retirement of R. U. Sayce from the keepership, 411
  Appointment of Dr. D. E. Owen as keeper, 411
Manganese: Colorimetric Estimation of (W. V. Single), 250
Mangler, Dr. K. W.: Promoted to Senior Principal Scientific Officer in the Scientific Civil Service, 638; work of, 638
Mangolds (Stored): Effect of Gamma Rays on the Sprouting of (C. E. Cornford and B. D. Powell), 996
Manley, Prof. Gordon: *Obituary* of M. F. W. Holland, 634
Mann, E. J.: Appointed director of the Commonwealth Bureau of Dairy Science and Technology, 893
Mann, Dr. T.: Studies on Fertility (Methods of Testing for Spermicidal Activity), 226
  The Biochemical Basis of Spermicidal Activity (First Oliver Bird Lecture), 1027
Mansfield, Dr. W. P.: Appointed director of research of the British International Combustion Engine Research Association, 1237; work of, 1237
Manske, Dr. R. H. F.: Our Debt to the Future (The Penalties of Ignorance of Man's Biological Dependence), 259
Manson-Bahr, Sir Philip: History of the School of Tropical Medicine in London (1899-1949), *review* by Prof. T. H. Davey, 205
Manterfield, D.: Modern Analytical Chemistry in Industry (Spectrographic Methods of Steel Analysis), 367
Mantle Epithelium (Outer), of *Arca noae*: Mucous Gland Cells of the (E. R. Trueman), 1492
Manton, Prof. I.: Systematics of To-day (The Concept of the Aggregate Species), 740
Mapper, D. (Smales, A. A., and): Exploration of the Deep Ocean Floor (Neutron Activation Analysis of 'Cosmic' Spherules from Marine Sediment), 778
Marconi Premium of the British Institution of Radio Engineers awarded to Prof. P. M. Honnell, 530
Mares (Pregnant): Isolation of Uranediol from the Urine of (W. L. Glen, R. Barber and G. A. Grant), 288
Margary, Ivan D.: Roman Roads in Britain, Vol. 2, North of the Fosse Way—Bristol Channel (including Wales and Scotland), *review* by C. W. Phillips, 1256
Margenau, H.: Ionization Phenomena in Gases (Conductivity of Plasmas with respect to Microwaves), 794

Margenau, H., and Kelly, D. C. : Ionization Phenomena in Gases (Power Absorption from Microwaves at the Cyclotron Resonance by Electrons of Low Energy in a Discharge), 794
Margerison, Dr. T. A. : At the Annual Conference of the Library Association (The Interpretation of Science), 843
Margoliash, E., and others : Serological Changes Concomitant with the Growth of Mouse Tumours in Pretreated Rats, 185
Margolis, J. : Plasma Pain-producing Substance and Blood Clotting, 1464
Marine Algae of the Northeastern Coast of North America (Prof. William Randolph Taylor), second edition, *review* by Prof. Lily Newton, 1268
Marine Bacteria : Respiratory Characteristics of (Joseph R. Merkel, Angelo F. Carlucci and Prof. David Pramer), 1489
Marine Biological Association of the United Kingdom : Election of Dr. Å. Vedel Taning as an Honorary Member, 72
Journal of the, Vol. 36, No. 2, 745
Marine Biology : Researches in (John S. Colman), 745
Marine Centipede : Feeding Habits of a (J. Gordon Blower), 560
Marine Ecology : Vitamin B_{12} in (M. R. Droop), 1041, *erratum*, 1239 ; (K. W. Daisley), 1042
Marine Fish Larvae : Site of Chloride Regulation in (J. E. Shelbourne), 920
Marine Fishes : Visual Pigments and Depths of Habitat of (Prof. George Wald, Paul K. Brown and Patricia Smith Brown), 969
Marine Gastropod *Neptunea antiqua* : An Acetylcholine-like Salivary Poison in the (Dr. Ragnar Fange), 196
Marine Laboratories (Island), Association of : Establishment of the, 465
Election of Prof. D. M. Steven as president, 466
Marine Phytoplankton : Variability in Retention of, by Membrane Filters (Dr. Reuben Lasker and Robert W. Holmes), 1295
Marine Research : International Co-operation in (Dr. G. E. R. Deacon), 894
Marine and Continental Cycles of the Pleistocene Period in Morocco : Correlation between the (Georges Choubert), 1171
Marion, Leo : Elected president for 1957-58 of Section III (Mathematical, Chemical and Physical Sciences) of the Royal Society of Canada, 267
Mark, Prof. H. : Macromolecular Chemistry (Progress in Polymer Research and Technology), 842
Making and Breaking Polymer Molecules (Stereospecific Polymerizations), 900
Markham, M. F., and others : Variation of Elastic Constants of Hardened 1 per cent Carbon Steels on Tempering, 1254
Marking Calliphoridae (Diptera) during Emergence from the Puparium : A Method of (K. R. Norris), 1002
Marks, Joy, and others : Respiratory Metabolism of Aerated Potato Disks, 1142
Marloth, Dr. R. H. : Elected a Fellow of the Royal Society of South Africa, 1025
Marquardt, Martha (compiled and edited by Dr. F. Himmelweit, with the assistance of ; under the editorial direction of Sir Henry Dale) : The Collected Papers of Paul Ehrlich, Vol. 1, Histology, Biochemistry and Pathology, *review* by Prof. C. H. Browning, 620
Marr, A. G. M. (Fantl, Dr. P., and) : Phenols as Inhibitors of the Heparin Co-factor of Plasma, 990
Marrack, Prof. J. R. : Immunology—Research and Teaching, *review*, 257
Marriage : Neurotic Interaction in (edited by Victor W. Eisenstein), *review* by Dr. Clifford Allen, 4
Marriott, F. H. C., and others : Individual Differences in Night-Vision Efficiency, 228
Marrow (Bone), Spleen and Liver of Rats : Influence of Post-Irradiation Administration of Methionine on the Levels of Deoxyribonucleic Acid in (M. K. Nerurkar, A. J. Baxi, N. S. Ranadive, M. V. Narurkar and M. B. Sahasrabudhe), 193
Marrows *in vitro* (Megaloblastic) : Nucleic Acid Metabolism in (Dr. L. G. Lajtha and Dr. T. Kumatori), 991
Marsh, C. A. (Levvy, Dr. G. A., and) : Action of Copper on Mammalian *β*-Glucuronidase, 197
Purification of *β*-Glucuronidase from Female Rat Preputial Gland, 919
Marshall, Dr. A. J. : Birds of New Guinea, *review*, 675, 787
Marshall, Dr. A. J., and Disney, H. J. de S. : Experimental Induction of the Breeding Season in a Xerophilous Bird, 647
Marshall, Dr. P. G. (Hickman, J. R., and) : Narcotic Activity of Optical Enantiomorphs of Methylpentynol, 1053
Marshall, Dr. T. J. : Permeability and the Size Distribution of Pores, 664
Marshall Aid Commemoration Commission : Third Annual Report, 171
Marson, J. E. : Investigations on the Nymphs of the Water Boatman, *Notonecta*, 687
Martens, G., and others : Photochlorination of Chloroform, 1068
Martin, Dr. A. E. : Difference and Derivative Spectra, 231
Modern Analytical Chemistry in Industry (Infra-Red Spectroscopy), 367
Martin, A. J. P. : Gas Chromatography (Early Work on Separation Techniques), 841
Martin, Gustav J. (Kisch, Prof. Bruno, and) : Ultrastructure of Erythrocytes in Severe Scurvy, 812
Martin, Dr. J. T., and Somers, E. : Defence Mechanism of Plants against Fungi—Solubilization of Copper by Leaves and Water-soluble Acids from Leaf Wax, 797
Martin, Dr. J. T., and others : Defence Mechanism of Plants against Fungi—Fungistatic Properties of Apple Leaf Wax, 796
Martin, Robert W. : The Chemistry of Phenolic Resins, *review* by Prof. C. E. H. Bawn, 672
Martin, William Ted, and Reissner, Eric : Elementary Differential Equations, *review* by Dr. L. S. Goddard, 58
Martini, C. K. H. : Appointed plant pathologist, West African Cacao Research Institute, Western Region, Nigeria, 413
Martyn, Dr. D. F. : Presented with the eighth Charles Chree Medal and Prize of the Physical Society, 531
The Ionosphere as Dynamo and Motor, 531
Marvin, Prof. J. W. : Tree Physiology (Mechanism of Maple Sap Flow), 77
Mascall, Rev. Dr. E. L. : Evolution and Theology, *review*, 671
Mashes (Potato) : Saccharification of, by means of Fungal Preparations (K. Beran, M. Burger and S. Zelenka), 362
Masking in Viral and Rickettsial Infections : Latency and (University of Wisconsin, the Rockefeller Foundation and the Wisconsin Alumni Research Foundation Symposium on), 788
Mason, Dr. B. J. : Atmospheric Electricity, *review*, 402
Recent Developments in Cloud Physics, 573
Exploration of the Deep Ocean Floor, 780
Mason (Josiah) Lectures of the University of Birmingham (Prof. I. Schapera), *review* by Dr. A. L. Epstein, 1442
Mason, R. J. : Occurrence of Stone Artefacts with *Australopithecus* at Sterkfontein, Part 2, 523
Mason, Dr. S. G. : Rheology of Disperse Systems (Dilute Suspensions of Solid and Liquid Spheres in Golden Syrup and other Liquids), 958
Mason, Dr. S. G., and others : Fundamental Aspects of Fibres and their Treatment for Papermaking (Hydrodynamic Behaviour of Papermaking Fibres), 1177
Masquelier, Prof. J. : Vegetable Quality (Bactericidal Action of certain Wines), 175
Mass and Concentration : A Cell Compressor for the Measurement of, by Interference Microscopy (Dr. R. J. Goldacre, Dr. D. M. Easty and Dr. E. J. Ambrose), 1487
Mass Destruction : Hazards associated with the Development of Weapons of—International Meeting of Scientists, 358
Mass-Spectrometric Assay of Elementary Nitrogen (Dr. J. B. Capindale and Dr. D. H. Tomlin), 701
Massam, T., and others : Longitudinal Polarization of the Positrons from the Decay of Unpolarized Positive Muons, 731
Massive Oral Administration of Plutonium : Absence of Lethal Radiation Effects following (Maurice F. Sullivan and Dr. Roy C. Thompson), 651
Mast Cells : Secretion of Heparin by (Dr. M. Hill), 654
Mast Cells in the Epithelium of the Œsophagus (Dr. F. R. Johnson and R. M. H. McMinn), 615
Masui, M. : Awarded a Japanese Fellowship for 1957-58 by the Ramsay Memorial Trust, 316
Materials : Chemistry, the Conquest of (Kenneth Hutton), *review* by G. Fowles, 352
Technology and the Quest for (J. Gray), 735
Materials for Gas-cooled Reactors : Creep Tests on (New research equipment in the Materials Research Laboratory of the General Electric Company's Atomic Energy Division), 1392
Materials at High Rates of Strain : Properties of (Institution of Mechanical Engineers Conference on), 584
Materials for Nuclear Engineering (Physical Society Conference on), 468
Materials (Brittle) : Mechanical Properties of Non-Metallic (National Coal Board Conference on), 412
Strength of Highly Porous (K. Schiller), 862
Materials Testing Reactor at Harwell : PLUTO, the, 952
Construction of, 952
Mathematical Colloquium at University College, Cork, 363
Mathematical Conference for School Teachers and Industrialists, 467
Mathematical Data : Tables of Integrals and other (Prof. Herbert Bristol Dwight), third edition, *review* by Dr. G. A. Garreau, 1270
Mathematical Economics (Prof. R. G. D. Allen), *review* by Prof. D. G. Champernowne, 876
Mathematics in the University of Manchester, 69
Mathematics : Remarks on the Foundations of (Ludwig Wittgenstein), edited by G. H. von Wright, R. Rhees and G. E. M. Anscombe (translated by G. E. M. Anscombe), *review* by F. I. G. Rawlins, 399
Mathematics in Industry, 467
Mathematics, Illinois Journal of, Part 1 (University of Illinois), 70
Mathematics (Applied) : Science and (Recent Advances in Science), (edited by Prof. Morris H. Shamos and Prof. George M. Murphy), *review* by G. R. Noakes, 206
Matheson, F. J. : Appointed geologist, Kenya, 1454
Mathews, Prof. Joseph Howard, and others : Experimental Physical Chemistry, fifth edition, *review* by Dr. E. F. G. Herington, 209
Mathewson, D. S., and others : Radio Pictures of the Sun, 944
Mathias, A. P., and others : Identification and Distribution of 5-Hydroxytryptamine in a Sea Anemone, 658
Mathur, K. B., and others : Distortion of Fluid Drops in the Stokesian Region, 331
Matijević, E., and Rogers, J. : Surface Properties of Sodium Octyl Sulphate in Saturated Salt Solutions, 560
Matoltsy, Dr. G. : Biology of Hair Growth (Chemistry of the Keratinization of Skin, Horn and especially Hair), 593
Matoltsy, A. Gedeon (Weiss, Prof. Paul, and) : Absence of Wound Healing in Young Chick Embryos, 854
Matsuda, K. : Chemical Syntheses, 985
Matter : Thermodynamics and the Structure of, *review* by Dr. A. F. Devonshire, 724
Matthews, Dr. L. Harrison : A Community of Penguins, *review*, 3
Obituary of Dr. J. E. Hamilton, 68
Filter Feeding in Flamingoes, 128
Life in the Abyss, *review*, 349
Matthews, Dr. P. T. : Appointed to the University of London readership in applied mathematics at the Imperial College of Science and Technology, 893
Matthews, Dr. R. E. F., and Smith, Dr. J. D. : Terminal Groups of Tobacco Mosaic Virus Nucleic Acid, 375
Matthews, Very Rev. W. R. : Thomist Philosophy, *review*, 873
Mattick, Dr. A. T. R. : Introduction to Microbiology, *review*, 519
Matty, Dr. A. J. : Occurrence of Periodic Acid—Schiff Positive Material in the Pituitary of the Parrot Fish, *Pseudoscarus guacamaia*, 1055
Maule, Dr. H. G. : The Worker and his Work (Presidential Address to Section J (Psychology), of the British Association for the Advancement of Science), 485
Maurice, Dr. D. M. : Awarded an Alexander Pigott Wernher Memorial Travelling Fellowship in Ophthalmology and Otology for 1957-58 by the Medical Research Council, 315
Mauritius Sugar Industry Research Institute : Annual Report for 1956, 218
Mauritzen, Dr. C. M., and others : Amino-Acid Composition of the Six Histones of Calf Thymocytes, 1107
Maxwell, A. E. : The Abyssal Circulation of the Ocean, 734
Maxwell (Clerk) Premium of the British Institution of Radio Engineers awarded to Dr. K. D. Froome, 529
Maxwell, I. R., and others (edited by) : The Economics of Nuclear Power including Administration and Law, Vol. 1, *review* by C. A. Rennie, 673
Maxwell, Robert A., and others : Antihypertensive Activity of Hexahydro-1-Azepinepropionamidoxime, 1200
May Lecture of the Institute of Metals (Sir Eric Ashby), 624
Maybank, J., and others : Cloud Physics (The Supercooling and Nucleation of Water and the Growth of Ice Crystals from the Vapour), 573
Mayer, Dr. A. M. : Inhibition of Ascorbic Acid Oxidase by Thiourea, 1417

Mayer, Dr A. M., and Poljakoff-Mayber, A. : Tactic Movements in *Chlamydomonas moewusii*, 927
Maynard, C. R. G. : Fundamental Aspects of Fibres and their Treatment for Papermaking (Bonded-Fibre Assemblages—Stepwise Pattern of Nordman's Curves relating Increase in Reflectance and Strain), 1177
Mayo, Dr F. : Chemical Engineering Education (The Urgent Need for more Chemical Engineers), 125
Mayorca, Giampiero di, and others : Anion Exchange Chromatography and Molecular Size of Deoxyribonucleic Acid, 1355
Mayr, E : Systematics of Today (The Evolutionary Significance of the Systematic Categories), 739
Meade, Prof J. E. : The Balance-of-Payments Problems of a European Free-Trade Area (Presidential Address to Section F (Economics), of the British Association for the Advancement of Science), 481
Meanings : Double, *review* by Dr. A. D Booth, 823
Measurement of Body Radioactivity : Papers given at a Conference on (*British Journal of Radiology*, Supp. No 7), 219
Measurement of Heats of Reaction : Experimental Thermochemistry—(edited by Frederick D. Rossini), *review* by Dr E. F. G. Herington, 57
Measurement of Iron Lost into and Re-absorbed from Gastro-Intestinal Bleeding Lesions : Isotopic Tracer Method for (M. Roche, M. E Perez-Gimenez and A Levy), 1278
Measurement of Lead Tolerance in Plants : A Technique for the (D. A. Wilkins), 37
Measurement of Mass and Concentration by Interference Microscopy A Cell Compressor for the (Dr R J. Goldacre, Dr. D. M. Easty and Dr. E. J. Ambrose), 1487
Measurement of Small Quantities of Fluoride with the Help of Fluorine-18 (Dr. J. H. Fremlin, Dr. J L. Hardwick and J. Suthers), 1179
Measurements . Instruments for Micro-Meteorological (I. F. Long), 321, *erratum*, 688
Measurements of Sunspots (Winifred Sawtell Cameron), 687
Mechanical Design for Electronics Production (John M Carroll), *review* by D. L Johnston, 1154
Mechanical Engineers, Institution of : Conference on Lubrication and Wear, 531, 1448
  Conference on Properties of Materials at High Rates of Strain, 584
Mechanical Properties of Non-Metallic Brittle Materials (National Coal Board Conference on), 412
Mechanics of Electronics, *review* by D. L. Johnston, 1154
Mechanics of the Mind, *review* by Dr. Clifford Allen, 772
Mechanics (Soil), and Foundation Engineering—Fourth International Conference (D. J. Maclean), 839
Mechanics (Soil), and Foundation Engineering, International Society of . Fourth International Conference, 270, 839
  Election of Prof A. W. Skempton as president, 840
Mechanics (Statistical) : Thermodynamics and (Dr. A H. Wilson), *review* by Dr. A F. Devonshire, 724
Mechanism of Chemical Reactions : Some Observations on the (Sir Cyril Hinshelwood), 1233
Mechanism of Contraction of Smooth Muscle by Drugs (Dr. D H. L. Evans and Dr H O Schild), 341
Mechanism of Conversion of Fat to Carbohydrate in Castor Beans (H L. Kornberg and H Beevers), 35
Mechanism of Drying of Thick Porous Bodies during the Falling-Rate Period (Prof. A. H. Nissan and W. G Kaye), 142
Mechanism of the Formation of Banded Structures in Steel (Prof. Paul Bastien), 787
Mechanism of Inhibition of Corrosion of Iron in Acid and Neutral Media based on the Electrocapillary Behaviour of Ions A Unified Theory of the (C. P. De), 803
Mechanism of Nerve-Impulse Transmission at a Crayfish Synapse (Dr. E J. Furshpan and D. D. Potter), 342
Mechanism of Phase Transformation in Metals—a Symposium organized by the Institute of Metals, London 1955, *review* by A. R Bailey, 453
Mechanism (Chemical), of Permanent Set (R S. Asquith, Prof J. B. Speakman and E. Telgyesi), 502
Mechanism (Reaction) : Solvent Effects and (Queen Mary College, London, Symposium on, under the auspices of the Chemical Society), 534
Meconin : Spiral Crystals of (W. R. Logan), 1412
Medawar, Prof P. B : Re-appointed a member of the Agricultural Research Council, 585
  Behaviour and Fate of Lymphocytes, 1016
Media (Porous) : The Physics of Flow through (Dr. Adrian E. Scheidegger), *review* by Dr Paul Eisenklam, 1008
Median Eminence : Resumption of Gonadotrophic Function in Pituitary Grafts following Retransplantation from Kidney to (M. Nikitovitch-Winer and J. W Everett), 1434
Medicago sativa L : Electrical Determination of Cold Hardiness in *Trifolium repens* L. and (C G Greenham and H. Daday), 541
Medical Department, Hong Kong : Appointment of E. G. N Greaves as chemist, 1454
Medical Research Council : Special Report Series No. 294, Individual Differences in Night-Vision Efficiency (M. H. Pirenne, F. H. C. Marriott and E F O'Doherty), 228
  Travelling Awards for 1957-58, 315
  Appointment of Prof A A. Miles and Prof. C. H. Stuart-Harris as members, 637
  Report for the Year 1955-1956, 744
Medical Research Council Tropical Metabolism Research Unit, University College of the West Indies : Dried Lanterns from Fireflies (*Photinus pallens*), 1454
Medical Science French Exchange Scholarships in (Medical Research Council Awards for 1957-58), 315
Medical Sciences, International Organizations of : Symposium on the Physiopathology of the Reticulo-Endothelial System (edited under the direction of B. N Halpern by B. Benacerraf and J. F. Delafresnaye), *review* by Prof. T. Nicol and D. L. J. Bilbey, 1155
Medical Students : Training of, 205
Medical and Biological Journals (Russian) : Publication of English Translations of (Pergamon Institute), 466
Medicine : Lederle Travelling Fellowship in (Medical Research Council Award for 1957-58), 315
  Rockefeller Travelling Fellowships in (Medical Research Council Awards for 1957-58), 315
  Steroids in Pharmacy and (Dr. G. I. M Swyer), 641
Medicine, Royal Society of : First Sherrington Memorial Lecture (Lord Adrian), 1028
Mediterranean Sea (Eastern) : Structure of the Crust under the (J. Cl. De Bremaecker), 755
Medulla of Sheep affected with Scrapie . Significance of Vacuolated Neurones in the (I. Zlotnik), 393
Medullary Pyramids : Intracellular Recording from Spinal Motoneurones following Stimulation of (Dr. Roger Merritt Morrell), 709
Medusae : Evolutionary Trends in the Classification of Capitate Hydroids and (Dr. William J. Rees), 130
Medvedev, Prof S. S. : Macromolecular Chemistry (Mechanism of Emulsion Polymerization), 842
Meek, J. M . Ionization Phenomena in Gases (Recent Researches in Spark Breakdown), 791
Meenan, James, and Webb, David A. (edited by) : A View of Ireland, *review*, 488
Meereskunde : Allgemeine—eine Einfuhrung in die Ozeanographie (Gunter Dietrich), *review* by Dr G E. R. Deacon, 1007
Megaloblastic Marrows *in vitro* : Nucleic Acid Metabolism in (Dr. L. G Lajtha and Dr T. Kumatori), 991
Mehra, P. N , and Verma, S C. : Cytology of Indian Species of *Onychium*, 715
Mehrotra, K. N , and Smallman, B. N. : Ovicidal Action of Organo-phosphorus Insecticides, 97
Meidner, H (Heath, Dr O V. S., and) : Midday Closure of Stomata—Effects of Carbon Dioxide and Temperature on Stomata of *Allium cepa* L , 181
Melanin in Mammals : Tyrosine Peptides as Precursors of (Dr. Kerry Yasunobu), 441
Melanization : Sclerotization and—Two Independent Processes in the Cuticle of the Desert Locust (Dr. S. R. A. Malek), 237
a-Melanocyte-stimulating Hormone : Amino-Acid Sequence of the (Dr. J Ieuan Harris and Dr Aaron B Lerner), *erratum*, 316
Mellon Institute, Pittsburgh : Advantages from Research in (1956-1957), 845
Mellor, F C. (Stace-Smith, R., and) : Transmission of Raspberry Mosaic Viruses to the Strawberry, 172
Mellor's Comprehensive Treatise on Inorganic and Theoretical Chemistry : Supplement to (prepared under the direction of an Editorial Board), Supplement 2, Part I, F, CI, Br, I, At, including the Radiochemistry and Radiation Chemistry of the Halogens, *review* by Prof. J R. Partington, 258
Melville, Dr. H W : Modern Analytical Chemistry in Industry, 366
Membrane Currents in Clamped Vertebrate Nerve (José del Castillo, J. Y. Lettvin, W S McCulloch and W. Pitts), 1290
Membrane Filters : Variability in Retention of Marine Phytoplankton by (Dr. Reuben Lasker and Robert W. Holmes), 1295
Membrane Transport : A General Theory of, from Studies of Bacteria (Dr Peter Mitchell), 134
Membrane (Human Red Cell) : Search for a Potassium Compartment in the (A. K. Solomon, June Loucks, Daniel A. Pollen, Thomas J. Gill, 3rd , and Elizabeth Wolf), 993
Memoirs on Steel and Iron (R. A. F. de Réaumur), a translation from the original printed in 1722, by Anneliese Grunhaldt Sisco, *review* by Prof. F C. Thompson, 1263
Men : Instinctive Behaviour in Animals and, *review* by Dr P T Haskell, 518
Men and Women (Trained) : Supply of (British Association for the Advancement of Science Conference on), 305
Mendel, Prof B. (Kemp, A , and) : How does the Ehrlich Ascites Tumour obtain its Energy for Growth ?, 131
Mendelsohn, Dr Mortimer L : Photographic Densitometry with the Two—Wave-length Method, 1408
Mendelssohn, Dr. K. . Low-Temperature Physics in the U S S.R., 460, *erratum*, 893
Mendes, C. B. (Waterlow, Dr J. C , and) : Composition of Muscle in Malnourished Human Infants, 1361
Menke, J. R., and others (edited by) : The Economics of Nuclear Power including Administration and Law, Vol. 1, *review* by C A Rennie, 673
Menstruum : A Plain-muscle Stimulant in the (Dr W R Pickles), 1198
Mental Deficiency Research, Journal of, Vol 1, No 1, 1322
Mental Health, United States National Institute of Information Service on Psychopharmacology to be established by the Psychopharmacology Service Centre, 735
Mental Illness and Mental Deficiency, Royal Commission on the Law relating to : Report for 1954-57, 253
Mentally Ill Treatment of the, 253 ; (Dr. Donald McI Johnson), 868 , (The Editors), 868
Menzel, W . Biological Rhythms (Variations in the Interdependence in Health and Disease of the 24-hour Rhythm of Rectal Temperature, Urine Volume and Concentration of Chloride, Urea and Creatinine), 1101
Menzies, G , and others : Fixation of the Rabbit Pituitary Gland, 766
Mercer, A D , and others : Passivation of Iron by Chromate Solutions, 27
Mercer, Dr. E H : Electron Micrographs of Cross-Sections of Protein Monolayers, 87
  Biology of Hair Growth (Follicular Structure), 593 ; (The Biosynthesis of Fibres), 593
  Biological Aspects of Cancer (The Problem of Cell Contact and Cell Adhesion), 831
Mercury-198 Lamps : Prevention of Reversal in (K M Baird and D. S. Smith), 1476
Merica, Dr Paul D. *Obituary*, 1321
Merkel, Joseph R , and others . Respiratory Characteristics of Marine Bacteria, 1489
Merriman, Dr A D : Resignation as registrar-secretary of the Institution of Metallurgists, 838
Merz, L : Interference Spectroscopy, 956
Merxmüller, H. : Systematics of Today (Einige Probleme der Sippengliederung und Arealbildung in den Alpen), 742
Mesothorax of Diptera : Coxo-Subalar Muscle in the (Dr John Smart), 339
Meta-stable Omega Phase . Occurrence of the, in Zirconium Alloys (B A. Hatt, J. A. Roberts and G. I Williams), 1406
Metabolic Effects of Thyroglobulin . Metabolism and (Alister Craig, Brian Fox and Harold Jackson), 195
Metabolic Peculiarities of Brain Tissue : Sodium Ions and Tissue Metabolism—some (Genkichiro Takagaki and Yasuzo Tsukada), 707
Metabolically Active Lipoprotein : Elastin, a (Dr. Frank S. Labella), 1360
Metabolism of Acetate in *Hevea brasiliensis* (A. D. Patrick), 37

Metabolism of Ehrlich Ascites Carcinoma Cells. Effects of Sarcomycin on the (I J Bickis, Dr E. H. Creaser, Prof. J. H. Quastel and Dr. P. G. Scholefield), 1109
Metabolism of Pyridine Nucleotides: Vitamin B_{12} and the (Dr. G. B. Nadkarni, D. S. Wagle and Prof. A. Sreenivasan), 659
Metabolism of Pyruvate and α-Ketoglutarate in Virus-infected Mouse Brain (P. L. Bradley), 1418
Metabolism (Chlorogenic Acid), in Cider Fermentation (Dr. G. C. Whiting and J G. Carr), 1479
Metabolism (Cholesterol): Effect of Different Dietary Fats on the Faecal End-Products of (H. Gordon, B. Lewis, L. Eales and Prof. J. F. Brock), 923
Metabolism (Micronutrient Element), in Plants Some Aspects of (Dr. E. J. Hewitt), 1020
Metabolism (Nucleic Acid), in Megaloblastic Marrows *in vitro* (Dr L. G. Lajtha and Dr T. Kumatori), 991
Metabolism (Respiratory), of Aerated Potato Disks (Nora Calo, Joy Marks and J. E. Varner), 1142
Metabolism (Spermatozoan): Carbon Dioxide as a Reversible Inhibitor of (Prof G. W Salisbury and N L VanDemark), 989
Metabolism (Tissue): Sodium Ions and—some Metabolic Peculiarities of Brain Tissue (Genkichiro Takagaki and Yasuzo Tsukada), 707
Metabolism (Water), in the Sheep (J. V. Evans), 756
Metabolism and Metabolic Effects of Thyroglobulin (Alastair Craig, Brian Fox and Harold Jackson), 195
Metabolites (Carbohydrate) · Utilization of, by Rumen Micro-organisms (the late Dr. A. John G Barnett and M. G. C. M. Dow), 548
Metal Emerging from the Corrosive: Corrosion as affected by a Zone of (Dr. P. Hersch), 1407
Metal Coatings: Research on—British Iron and Steel Research Association, South Wales Laboratories, 123
Metal Ions and Chelating or Complexing Agents: Formation of Liesegang-like Rings by (Prof Robert E. Feeney and Nelle Bennett), 979
Metal Surfaces (Solid): Wetting and Spreading of Liquid Metals on (Department of Industrial Metallurgy, University of Birmingham, Joining of Metals Conference on), 72, 1156
Metallic Layer Structure: A New (J. F. de Wet), 1412
Métallurgie, Société Française de: Autumn Meeting, 219
    Grand Medal presented to Prof. G. Chaudron, 219
    First Prizes presented to G Pomey and A. Gueussier, 219
Metallurgists, Institution of · Resignation of Dr. A. D. Merriman as registrar-secretary, 838
    Appointment of R. G. S. Ludlam as registrar-secretary, 838
Metallurgy at Oxford, 1321
Metallurgy: Capper Pass Awards in (Institution of Mining and Metallurgy and the Institute of Metals), 361
Metallurgy (Extraction), at the Imperial College, 18
Metals: The Band Theory of, and the Structure of the Fermi Surface (Physical Society Conference on), 893, 1172
    Grain-Growth in, by Cyclic Stress (Prof H. Okubo and N. Nozaki), 604
    The Mechanism of Phase Transformation in—a Symposium organized by the Institute of Metals, London 1955, *review* by A R Bailey, 453
    The Newer (Royal Institute of Chemistry, the Chemical Society and the Society of Chemistry Industry Joint Symposium on), 637
    The Physics and Chemistry of (Prof. N. F Mott), 272
    Science of, at Oxford, 1319
    Study of Strain Distribution in, by the Determination of Local Electrode Potentials (Prof. Hugh O'Neill and Dr. D. Eurof Davies), 498
    Vacuum Deposition of (Department of Physics of the University of Cambridge and the British Scientific Instrument Research Association Meeting on), 124
Metals, Institute of Symposium on the Mechanism of Phase Transformation in Metals (London, 1955), *review* by A. R. Bailey, 453
    Annual May Lecture (Sir Eric Ashby), 624
Metals, Institute of (Metals Physics Committee): Symposium on Vacancies and other Point Defects in Metals and Alloys, 893
Metals, Institute of (Institution of Mining and Metallurgy and the): Capper Pass Awards in Metallurgy, 361
Metals and Alloys: Vacancies and other Point Defects in (Metals Physics Committee of the Institute of Metals Symposium on), 893
Metals and Inorganic Crystals: Observations of Dislocations in (Course of lectures at the University of Bristol), 467
Metals (Joining of) Conference on the Wetting and Spreading of Liquid Metals on Solid Metal Surfaces (Department of Industrial Metallurgy, University of Birminghan, Conference on), 72, 1156
Metals (Alkali, Alkaline-Earth and other): High-Voltage Paper Electrophoresis of Inorganic Cations—(Dr. D. Gross), 596
Metals (Liquid), on Solid Metal Surfaces: Wetting and Spreading of (Department of Industrial Metallurgy, University of Birmingham, Joining of Metals Conference on), 72, 1156
Metals (Rarer). Extraction and Refining of the (Proceedings of a Symposium on Extraction Metallurgy of some of the Less Common Metals arranged by the Institution of Mining and Metallurgy, London, 1956), *review* by A. R. Bailey, 258
Metamict Tantalite from Western Australia (Prof. C. Osborne Hutton), 248
Metamorphosis (Abnormal), in Saturniid Moths infected by a Microsporidian (Dr. L. H. Finlayson and W. Ann Walters), 713
Metcalfe, Dr. George (Brown, Dr. Margaret E., and): Nitrogen Fixation by a Species of *Pullularia*, 282
Meteor Orbital Period: A Prediction of a (E. G. Bowen), 737
Meteor Orbits and Rainfall, 737
Meteorite Conference, Moscow: Report on the Seventh (E. L. Krinov), 1325
Meteorites: Uranium, Helium and the Ages of (Dr. George W. Reed and Prof. Anthony Turkevich), 594
Meteorological Committee, 361
Meteorological Office: Organization of the, 223
    Geophysical Memoirs No. 99, Tornadoes in England, May 21, 1950 (H H. Lamb), 966
Meteorological Organization, World: Annual Prize awarded posthumously to the late Prof. Carl Gustaf Rossby, 787
Meteorological Society, Royal: Election of Officers for 1957-58, 21
    Memorial to G. J. Symons, 313
    Climatological Station at Camden Square, London, opened by Dr. R. C. Sutcliffe, 314
    Discussion on Cloud Physics, 573
    Discussion on Hill Climate, 574
Meteorological Society (Royal), and the Royal Astronomical Society: Joint Symposium on Planetary Atmospheres and Convection in Rotating Fluids, 1455
Meteorological (Micro-) Measurements: Instruments for (I. F. Long), 321, *erratum*, 688
Meteorology at Harvard, 313
Meteorology: International, *review* by G. A Bull, 107
Meteorology, International Association of · Scientific Proceedings of the, Rome, 1954, *review* by G. A. Bull, 107
Meteors: Artificial, 1168
Meteors (Sporadic): Theory of the Annual Variation of (Tadayoshi Murakami), 1239
Methane Adsorbed on Titanium Dioxide: Nuclear Magnetic Resonance of (Prof. N. Fuschillo and C. A. Renton), 1063
Methanesulphonate (2-Chloroethyl): Autonomous Action of Lethal Mutations induced in the Germ Cells of *Drosophila melanogaster* by (C. E. Purdom), 81
Methanesulphonates (Alkyl-): Mutagenic Response to the, during Spermatogenesis in *Drosophila melanogaster* (Dr. O. G. Fahmy and Dr. Myrtle J. Fahmy), 31
Methionine Influence of Post-Irradiation Administration of, on the Levels of Deoxyribonucleic Acid in Bone Marrow, Spleen and Liver of Rats (M. K. Narurkar, A. J. Baxi, N. S. Ranadive, M. V. Narurkar and M. B. Sahasrabudhe), 193
Methionine Biosynthesis and Utilization in *Pseudomonas tabaci* and *Ps angulata* (Prof. E D. Garber and Susan G Shaeffer), 1282
Method of After-Images: The Repetitive Property of the Human Brain as studied by the Electroencephalograph, and the (Dr Catherine Popov), 328
Method for Concentrating Pollen Grains and Small Fossil Remains from Fibrous Peats and Moss Polsters (D. M. Churchill), 1437
Method of Marking Calliphoridae (Diptera) during Emergence from the Puparium (K. R. Norris), 1002
Method (Autoradiographic), for Water-soluble Isotopes of Short Half-life: Demonstration of Early Renal Uptake of Potassium-42 by an (Dr. V. D. Eisen and Dr. P. T. C. Harris), 440
Method (A Convenient), for Labelling Biologically interesting Carboxylic Acids with Tritium (N. P Buu-Hoï), 385
Method (A Dilatometric), of Following the Non-stationary State of Polymerization Reactions (Dr. W. I. Bengough), 1120
Method (Isotopic Tracer), for Measurement of Iron Lost into and Re-absorbed from Gastro-intestinal Bleeding Lesions (M. Roche, M E. Perez-Gimenez and A. Levy), 1278
Method (Modified), of Carbon Marking (Dr P. H. S. Silver), 1415
Method (A Non-Destructive), of Detecting Diseases in Wood (J. S. Ward and M J. Woodman), 47
Method (A Photometric), for Avian Liver Xanthine Dehydrogenase (Heinz G Schwartz and Prof. Gerald Litwack), 761
Method (A Semi-continuous), for the Large-scale Production of Tetanus Toxin (Dr Robert O. Thomson), 1126
Method (A Simple), of Determining Ultrasonic Velocities in Rocks (K. Subbarao and Dr B. Ramachandra Rao), 978
Methodology of the Humanities with special reference to Linguistics: Outline of Glossematics—a Study in the (H. J Uldall), Part I, General Theory, *review* by P. T. Geach, 878
Methods: Numerical (Dr R. A. Buckingham), *review* by Dr. A. D. Booth, 875
    Micro- and Semi-Microchemical (Norwood Technical College Course on), 1171
Methods of Studying the Microbiology of Soils (Symposium at the University Institute of Agronomy, Louvain), 591
Methods (Optical-Transform): Direct Structure Determination by (M. M. Crowder, K. A Morley and Dr. C. A. Taylor), 431
Methods and Techniques (New), for the Communication of Knowledge (Dr. H. Coblans), 735
Methylcellulose · Effect of Storage of, on Blood Protein Formation in the Rat (Margaret M. Frohlich, V. Balázs and S. Benko), 1474
Methylene Blue added to a Low Fat Diet in the Mouse: Effects of (A. Fajer), 1054
Methylene Blue (Intravenous): Treatment of Cancer in Dogs by (R. T. Pursell), 1300
Methylpentynol · Narcotic Activity of Optical Enantiomorphs of (J. R. Hickman and Dr. P. G. Marshall), 1053
Metre: Optical Definition of the (Dr. H Barrell), 1387
Metrology: Optics in (International Commission for Optics International Colloquium on), 1172
Metropolitan-Vickers Electrical Co., Ltd. Donation of £4,000 to the University of Sheffield, to provide equipment for the Department of Mechanical Engineering, 21
Meudt, W. (Vlitos, A. J., and): Relationship between Shoot Apex and Effect of Gibberellic Acid on Elongation of Pea Stems, 284
Meuleau, C. (Goudet, Prof. G., and): Semiconductors, their Theory and Practice (translated by G. King), *review* by Dr A. A. Shepherd, 566
Meyer, Karl, and others: The Hyaluronidase of the Leech—an Endo-glucuronidase, 810
Mice: A Diurnal Cycle in the Mitotic Activity of Ascites Tumour Cells in (Dr I P. S. Agrell and Else Welin-Berger), 705
    Effect of Exteroceptive Factors on the Œstrous Cycle of (W. K. Whitten), 1436
    Induction of Translocations in, by Triethylenemelamine (B. M. Cattanach), 1364
    Surviving Rat Skin Grafts in (O. Brocades Zaalberg, O. Vos and D. W. van Bekkum), 238
    Use of Wooden Boxes for Breeding (Joyce L. Bloom, Dr. W. Lane-Petter and G. Porter), 251
    Xanthine Oxidase Activity during Mammary Carcinogenesis in (I. Lewin, R. Lewin and R. C Bray), 763
Mice (Irradiated): Production of Rat Serum Proteins in (W. W. H. Weyzen and O. Vos), 288
Micelle Dimension of Potato Starch (Susumu Hizukuri and Ziro Nikuni), 436
Micelles of Long Life—a Step towards Biological Organization (Dr. T. Nash), 188
Michael, Patricia J. (Tomkins, Dr. Gordon M., and): Inhibition of Adrenal 11β-Hydroxylation by Ions, 337
Michel, J. F, and others: The Sheep Lungworm *Protostrongylus brevispiculum* in Great Britain, 1372

Michie, Donald, and West, D. J, · An Experiment on 'Telepathy' using Television, 1402

Michotte, Prof. Albert : Reflexions on the Role of Language in the Analysis of Perceptual Organization (Presidential Address to the fifteenth International Congress of Psychology), 533

Michoustine, Prof. E. N. : Methods of Studying the Microbiology of Soils (Methods employed in the U.S.S.R. for Determining the Biological Activity of Soils), 591

Micro and Semi-Microchemical Methods (Norwood Technical College Course on), 1171

Microbial Ecology—Seventh Symposium of the Society for General Microbiology, London, 1957 (edited by R. E. O. Williams and C. C. Spicer), *review* by Dr S D. Garrett, 351

Microbial World · The (Prof. Roger Y. Stanier, Prof. Michael Doudoroff and Prof. Edward A. Adelberg), *review* by Dr A. T. R Mattick, 519

Microbiological Societies, International Association of : Funds for assisting the work of type culture collections of micro-organisms, 316

Microbiology : Dictionary of (Morris B. Jacobs, Maurice J Gerstein and Prof. William G, Walter), *review* by Dr E. F. Gale, 209
  Introduction to, *review* by Dr. A. T. R. Mattick, 519
  Soil (J. S. Waid and D Parkinson), 591

Microbiology of Soils · Methods of Studying the (Symposium at the University Institute of Agronomy, Louvain), 591

Microbiology (General), Society for : Seventh Symposium of the, London, 1957—Microbial Ecology (edited by R. E. O. Williams and C. C. Spicer), *review* by Dr S. D. Garrett, 351

Microbiology (Soil), at Rothamsted, 634

Microchemistry (Midlands Section and Microchemistry Group of the Society for Analytical Chemistry Symposium on), 72

Microfibrils (Nucleoprotein) : A Lattice Distortion of Alkali Chloride Crystals in the presence of (J. C. White and P. C. Elmes, and V. Balashov, Prof. R. D. Preston and G. W. Ripley), 696

Microflame Detector for Gas Chromatography : Scott (Shandon Scientific Co., Ltd.), 530

Micrographs (Electron), of Cross-Sections of Protein Monolayers (E. H. Mercer), 87

Micro-Meteorological Measurements : Instruments for (I. F. Long), 321, *erratum*, 688

Micronutrient Element Metabolism in Plants : Some Aspects of (Dr. E J. Hewitt), 1020

Micro-Nutrients (Macro- and) : Visual Symptoms in *Hevea brasiliensis* of Deficiencies in (Dr E W. Bolle-Jones), 362

Micro-organisms : Type Culture Collections of (International Association of Microbiological Societies funds for assisting the work of), 316

Micro-organisms (Rumen) . Utilization of Carbohydrate Metabolites by (the late Dr. A. John G. Barnett and M. G C. M. Dow), 548

Micro-organisms (Soil) : Reversal of Boric Acid Inhibition of Growth in certain (Alan M. Shefner and Betty J. Burkhardt), 1207

Møller, Chr. Kn : A Phase Transition in Caesium Plumbochloride, 981
Mollusc : Isolation of 2-Aminoethanesulphinic Acid from a (Shin'ichi Shibuya and Shunji Ouchi), 549
Molluscan Tropomyosin : Structure of (Dr. Jean Hanson, Dr J. Lowy, Dr. H. E. Huxley, K. Bailey, C. M. Kay and J. C. Ruegg), 1134
Molybdenum Deficiency in Latosols of Java (Dr. J. D. Newton and Anwar Said), 1485
Molybdenum Nutrition and Free Amino-Acids in Tomato (J. V. Possingham), 363
Molybdenum and Copper : Effects of, on some Enzymes in *Neurospora* (K. Commissiong and Dr. D. J. D. Nicholas), 555
Monitoring Radioactive Fall-out, 952
Monkey · The General Radiation Syndrome—Initial Reaction in the (Prof. C. G. Hunter, R. J. Munson, W. M. Court Brown and J D. Abbatt), 1466
Monkey and Guinea Pig : Missing Step in Man ; required for the Biosynthesis of L-Ascorbic Acid (Dr. J. J. Burns), 553
Monkeys · Abnormal Haemoglobins in (G. F. Jacob and Dr. N. C. Tappen), 241
Monkhouse, Dr. A C. : Appointed to the Fuel Efficiency Advisory Committee, 172
Monks, F. Taylor : Teeth of the Aleuts, *review*, 1380
Monoaluminate (Calcium) · Crystal Structure of (Maryon W Dougill), 292
Monoclinic System : Crystals of the, Parts 1, 2, and 3 (Dr. M. W. Porter and R. C. Spiller), (The Barker Index of Crystals, Vol. 2), *review* by Dr. F. C. Phillips, 821
Monolayers (Protein) : Electron Micrographs of Cross-Sections of (E. H. Mercer), 87
Monosulphate (Flavin) : Effect of, on Old Yellow Enzyme (Prof. Hugo Theorell, Kunio Yagi, George D. Ludwig and Fujio Egami), 922
Monozygotic Twins : Identical Nature of the Leucocyte Antigens detectable in, by means of Immune Iso-Leuco-agglutinins (J. Dausset and H. Brecy), 1430
Montagna, Prof. W. : Biology of Hair Growth, 592
Montagu, Dr. K. A. · Catechol Compounds in Rat Tissues and in Brains of Different Animals, 244
Montagu, Prof. M. F. Ashley The Direction of Human Development, *review* by Prof T S Simey, 157
Monteith, Dr J. L. : Dew, 1400
Montgomerie, G A. : Digital Calculating Machines and their Application to Scientific and Engineering Work, *review* by Dr. A. D. Booth, 823
Montgomery, R B. : The Abyssal Circulation of the Ocean, 734
Monthly Extrusion of Unfertilized Eggs Hermaphroditism with Self-Fertilization and the, in the Viviparous Fish *Lebistes reticulatus* (Dr. H Spurway), 1248
Montrose, Prof. J. L. . University Apartheid in South Africa, 1165
Moore, Bernard . The Second Lesson—Seven Years at the United Nations, 933
Moore, D · Appointed conservator of forests, Trinidad, 413
Moore, Dr. P. W. J., and others : Initiation and Growth of Explosion in Solids (Ignition of Primary Explosives by Electric Discharges), 74
Moore, S. · Protein Structure and Biological Activity, 833
Moore, Dr Thomas · Vitamin A, *review* by Prof R. A. Morton, 452
Moore, T. A. · Appointed geologist, Cyprus, 413
Moorrees, Dr. Coenraad F. A. · The Aleut Dentition—a Correlative Study of Dental Characteristics of an Eskimoid People, *review* by F Taylor Monks, 1380
Morale . Size and, Part 2 (Acton Society Trust), 694
Morale in Industry (T. H. Hawkins), 694
Morawetz, Prof. H. : Macromolecular Chemistry (Reactions of Natural Macromolecules), 842
Morel, S W : Appointed geologist, class I, Cyprus, 688
Morfee, R. G. S., and Staveley, L. A. K. : Dependence of Heat Capacity of certain Crystals on their Thermal History, 1246
Morgan, H R. · Latency and Masking in Viral and Rickettsial Infections (Psittacosis Virus kept in a Latent State by Starving the Cultures), 788
Morgan, J. W. W. (King, Dr F. E , and) : Recent Advances in the Chemistry of Terpenoid Compounds (Structure of Ketonic Acid), 471
Morgan, T. B , and Yudkin, Prof. John : The Vitamin-sparing Action of Sorbitol, 543
Morgan, Prof. Walter, and Kohlmeyer, William : Hens with Bilateral Oviducts, 98
Morgan, Dr. Winfield S : Use of Pilocarpine in Pancreatic Research, 987
Morgan, Prof. W. T. J. (Watkins, Dr. Winifred M , and) : Specific Inhibition Studies relating to the Lewis Blood-Group System, 1038
Morgane, P. J., and Kosman, Prof A J. : Alterations in Feline Behaviour following Bilateral Amygdalectomy, 598
Morgulis, Dr. W. : Vegetable Quality (Effect of Minerals in Wheat on Flour Quality), 175
Morley, Dr F. V. : Appointed liaison officer to the joint committee of the Royal Society and the Nuffield Foundation administering grants to assist learned scientific journals, 465 ; work of, 465
Morley, K. A., and others : Direct Structure Determination by Optical-Transform Methods, 431
Morley College, London : Scientific Activities of, 413
Morlin, Z. : Thallium-activated Sodium Chloride Recrystallization Phosphors, 89
Morocco : Correlation between the Marine and Continental Cycles of the Pleistocene Period in (Georges Choubert), 1171
  High-Level Beach Lines in, 1171
Morphogenesis : Applied, 1393
Morphogenesis in Canadian Forest Species · Growth and (G H. Duff and N. J. Nolan), 1393
Morphological Changes of Tubercle Bacilli caused by Staining Procedures (Prof T Ebina, C. Shinohara, H. Saito, K. Fukushi and J Suzuki), 42
Morphological Studies on the Kallymeniaceae (R. E. Norris), 113
Morphology and Cytology of Linseed Autotetraploids (K. K. Pandey), 269
Morrell, Dr. C. A. : Control of Chemical Additives in Food, 692
Morrell, Dr. C. A , and Thatcher, Dr E S. : Control of Chemical Additives in Food (Use of Antibiotics), 693
Morrell, Dr. Roger Merritt : Intracellular Recording from Spinal Motoneurones following Stimulation of Medullary Pyramids, 709
Morrey, Jr , C B., and others (edited by) : Transactions of the Symposium on Partial Differential Equations held at the University of California, 1955, *review* by Dr. L S Goddard, 58
Morris, D , et autres : l'Instinct dans le Comportement des Animaux et de l'Homme, *review* by Dr. P. T Haskell, 518
Morris, Dr. D F. C , and others · Given a Capper Pass Award of £120 by the Institution of Mining and Metallurgy and the Institute of Metals, 361
Morris, R D : Appointed geologist, Cyprus, 413
Morrison, Herbert, and others : Vitality in Administration, 153

Morrison, J. R. : Bilingualism in Education, 689
Morse Potential : Classical Motion under a (N. B. Slater), 1352
Mortlock, Dr. J. R. : A. C. Switchgear, Vol. I, A Survey of Requirements, *review* by Dr. J. S. Forrest, 1379
Morton, Prof. F. : Chemical Engineering Education, 125
Morton, Dr J. E. : Mosaic Evolution in Hydroids, 130
Morton, Dr J. E., and others : Research in Marine Biology (Adaptation of the High-level Shore Lamellibranch *Lasaea rubra*), 746
Morton, Prof R. A. : Flour and Bread (Considerations and Conclusions of the Panel on Composition and Nutritive Value of Flour), 318
  Vitamin A, *review*, 452
Morton, Prof. R. A., and Pitt, G. A. J. : Visual Problems of Colour (Visual Pigments), 1395
Morton, Prof. R. K. (Branster, Marjorie V., and) : Isolation of Intact Liver Cells, 1283
Morton, Prof. W. E. : Appointed vice-principal of the Manchester College of Science and Technology and Arkwright professor of textiles, 169
  Awarded the Warner Memorial Medal for 1957 of the Textile Institute, 169, 363
Mosaic Evolution in Hydroids (Dr. J. E. Morton), 130
Mosaic Virus (Tobacco) : Chromatography of, on a Cellulose Cation Exchange Adsorbent (Prof. George W. Cochran, John L. Chidester and Dayna L. Stocks), 1281
  Ultra-violet Irradiation of Dry (Albert Siegel), 1430
Mosaic Virus (Tobacco) Nucleic Acid : Terminal Groups of (Dr. K. K. Reddi and Dr. C. A. Knight), 374 ; (Dr. R. E. F. Matthews and Dr. J. D. Smith), 375
Mosaic Viruses (Raspberry) : Transmission of, to the Strawberry (R. Stace-Smith and F. C. Mellor), 172
Mosby, H. : The Abyssal Circulation of the Ocean, 733
Mosinger, Bedřich, and Kuhn, Eduard : Alimentary Lipaemia and Resistance to Altitude Anoxia, 1140
Moskowitz, Prof. Merwin, and Carb, Saul : Surface Alteration and the Agglutinability of Red Cells, 1049
Moss, Dr. T. S., and others : Some Observations of the Infra-red Solar Spectrum from a High-flying Aircraft, 1187
Moss Polsters : A Method for Concentrating Pollen Grains and Small Fossil Remains from Fibrous Peats and (D. M. Churchill), 1437
Moths (Saturniid), infected by a Microsporidian : Abnormal Metamorphosis in (Dr. L. H. Finlayson and W. Ann Walters), 713
Motile Anomiid (Saddle Oyster) : *Enigmonia aenigmatica* Sowerby, a (Prof. C. M. Yonge), 765
Motile Gametes in *Prasiola stipitata* Suhr : Occurrence of (Dr. Kathleen M. Drew and I. Friedmann), 557
Motion of the Satellites : The Effect of the Saturnian Ring upon the (Yoshihide Kozai), 837
Motion (Classical), under a Morse Potential (N. B. Slater), 1352
Motoneurones (Spinal) : Intracellular Recording from, following Stimulation of Medullary Pyramids (Dr. Roger Merritt Morrell), 709
Motor : The Ionosphere as Dynamo and (Dr. D. F. Martyn), 531
Mott, Prof. N. F. : Semiconductors, 25
  Elected president for 1957-58 of the Physical Society, 122, 273
  The Physics and Chemistry of Metals (Presidential Address to the Physical Society), 272
Mount, Dr. L. E. : Alloxan Diabetes in the Piglet, 344
Mount Wilson and Palomar Observatories : Retirement of Dr. Seth B. Nicholson, 360
  Retirement of Dr Milton L. Humason, 360
Mountain (Submarine) : A New, in the Pacific Ocean (I. V. Sergeev and G. B. Udintsev), 530
Mounts (Plastic), for Biological Display (Dr. Blodwen Lloyd), 737
Mouse : Duration of Spermatogenesis in the (Dr E. F. Oakberg), 1137, 1497 ; (Dr J. L. Sirlin and Dr. R. G. Edwards), 1138
  Effects of Methylene Blue added to a Low Fat Diet in the (A. Fajer), 1054
Mouse Brain (Virus-infected) : Metabolism of Pyruvate and α-Ketoglutarate in (P. L. Bradley), 1418
Mouse Leukaemia : Induction of, with Purified Nucleic Acid Preparations (Dr. Esther F. Hays, Norman S. Simmons and William S. Beck), 1419
Mouse Skin : Effect of Ultra-violet Light on, over a Wide Range of Intensities (Prof. S. Claesson, G. Wettermark and L. Juhlin), 992
Mouse Spleen : Chromatographic Characterization of Soluble Deoxypolynucleotides released in, by X-Irradiation (Dr. R. K. Main, L. J. Cole and M. E. Ellis), 1285
Mouse Tumours in Pretreated Rats : Serological Changes Concomitant with the Growth of (M. Pikovski, C. Tal, M. Schlesinger and E. Margoliash), 185
Mouse-breeding Colony : Attempted Control of Ectromelia in a (A. E. G. Pearson), 1300
Mouse-virulence of Group A Streptococci : Enhancement of (J. Cameron), 1136
Mouskos, J. C. : Appointed assistant conservator of forests, class I, Cyprus, 413
Movement of the Heart and Blood in Animals (William Harvey), translated from the original Latin by Prof. Kenneth J. Franklin, *review* by Prof. F. J. Cole, 449
Moving-Paper Collector for Column Chromatography (Dr. E. A. Bell), 190
Moving Surface (Random,) : Statistical Analysis of a (Dr. M. S. Longuet-Higgins), 228
Moving Visual Images produced by Regular Stationary Patterns (Dr. D. M. MacKay), 849
Moynihan, Dr. Martin H. : Appointed resident naturalist of the Smithsonian Institution's Panama Canal Zone Biological Area on Barro Colorado Island, 413
Mucopolysaccharides from Cartilage and Nucleus Pulposus (Dr G. Bernardi, Dr. F. Happey and A. Naylor), 1341
Mucoprotein (Cartilage) : Size and Shape of (Dr G. Bernardi), 93
Mucosa (Intestinal), of the Sheep : Changes in the, following Death by Humane Killer (A. M. Badawy, R. M. Campbell, Dr. D. P. Cuthbertson and B. F. Fell), 756
Mucous Gland Cells of the Outer Mantle Epithelium of *Arca noae* (E. R. Trueman), 1492
Mud Surface (Sorptive) : Improved Persistence of Dieldrin Deposits on (Ph. Gerolt), 394
Mudd, Dr. S. Harvey, and Cantoni, Dr. G. L. : Selenomethionine in Enzymatic Transmethylations, 1052
Mueller, K. O. (Cruickshank, I. A. M., and) : Water-Relations and Sporulation of *Peronospora tabacina* Adam, 44
Muirhead-Thomson, Dr. R. C. : Effect of Desiccation on the Eggs of *Simulium damnosum*, Theobald, 1432
Mukherjee, M. K. (Roy, A. B., and) : A New Type of Nitrogen-fixing Bacterium, 236
Mukherjee, Dr. S. R., and others : Kopsine and Strychnine—a Comparative Study of their Physiological Properties, 916
Muldowney, Dr. F. P. : Awarded a Rockefeller Travelling Fellowship in Medicine for 1957-58 by the Medical Research Council, 315
Mulholland, Dr. H. P. : Appointed senior lecturer in mathematics at the University of Exeter, 1239
Mull, Robert P., and others : Antihypertensive Activity of Hexahydro-1-Azepinepropionamidoxime, 1200
Mullard Radio Astronomy Observatory, Cambridge (M. Ryle), 110
Mullard Radio Astronomy Observatory, Cambridge (Staff of the) : Radio Observations of the Russian Earth Satellite, 879
Mullard, Ltd., and the Educational Foundation for Visual Aids : Film 'Mirror in the Sky' awarded the Premier Award in the Films for Use in Schools Section of the Festival of Films in the Service of Industry, 891
Mullen, Prof. James A. : Sodium, Potassium and Calcium Ions in the Haemolymph of *Oncopeltus fasciatus* (Dallas), 813
Muller, Prof. F. A. : Macromolecular Chemistry (Deformation Behaviour of Polymers), 842
Muller, Ralph (Dawes, Dr. Ben, and) : Maintenance *in vitro* of *Haplometra cylindracea*, 1217
Multichannel Pulse Height Analysers—Proceedings of an Informal Conference, Gatlinburg, Tennessee, 1956 (edited by H. W. Koch and R. W. Johnston), *review* by Dr. Denis Taylor, 1381
Multiple Cysts : Development of, and of Haemorrhagic Affections of Internal Organs in Albino Rats treated during the Embryonic or New-born Period with Rous Sarcoma Virus (G. J. Svet-Moldavsky), 1299
Multiple-Reflexion Technique : Absorption Spectra of Flat Flames using a (G. N. Spokes and Dr. A. G. Gaydon), 1114
Multipole Radiation from High-Current Gas Discharges (Dr. S. Kaufman), 1345
Multivibrator Operation (Bistable) : Analysis of—the Eccles-Jordan Flip-Flop Circuit (P. A. Neeteson), *review* by Dr. R. L. Smith-Rose, 401
Multivibrators : Pulse Circuits and, *review* by Dr. R. L. Smith-Rose, 401
Mulvey, Roland H. : Chromosome Number in the Sugar-Beet Nematode *Heterodera schachtii* Schmidt, 1212
Munro, Dr D. C. : Polarographic Wave Analysis, 540
Munro, Dr. G. H. : Travelling Disturbances in the Ionosphere—Changes in Diurnal Variation, 1252
Munroe, Miss D. C. : Awarded a Nature Conservancy Research Studentship for Postgraduate Training in Ecology (Botany), 467
Munroe, Dr. Ruth L. : Schools of Psychoanalytic Thought, *review* by Dr. Clifford Allen, 772
Munson, R. J., and others : The General Radiation Syndrome—Initial Reaction in the Monkey, 1466
Muons (Unpolarized Positive) : Longitudinal Polarization of the Positrons from the Decay of (G. Culligan, S. G. F. Frank, J. R. Holt, J. C. Kluyver and T. Massam), 751
Mura, Prof. Antonino : *Obituary* by Prof. Giorgio Salvini, 1167
Murakami, Tadayoshi : Theory of the Annual Variation of Sporadic Meteors, 1239
Murchison, D. G. : At the Second International Conference on Coal Science (Use of Reflectance Measurements in the Classification of Coals), 418
Murcray, Wallace B. : A Possible Auroral Enhancement of Infra-red Radiation emitted by Atmospheric Ozone, 139
Murexine : Muscarinic Action of, and some related Choline Esters (Dr. Martin M. Winbury), 988
Murgatroyd, R. J. : Cloud Physics (Recent Measurements of Condensation Nuclei, Cloud Particles and Rain), 573
Murgatroyd, Prof. W. : The Accident at Windscale, 1093
Murphy, Prof. George M. (edited by Shamos, Prof. Morris H., and) : Recent Advances in Science—Physics and Applied Mathematics, *review* by G. R. Noakes, 206
Murphy Chemical Co., Ltd. : 'Grisovin', 1171
Murray, Prof. E. G. D. : Our Debt to the Future (The Penalties of Ignorance of Man's Biological Dependence), 259
Muscarinic Action of Murexine and some related Choline Esters (Dr. Martin M. Winbury), 988
Muscle in Malnourished Human Infants : Composition of (Dr. J. C. Waterlow and C. B. Mendes), 1361
Muscle (Coxo-Subalar), in the Mesothorax of Diptera (Dr. John Smart), 339
Muscle (Glycolysing Insect) : Accumulation of a Stable Phosphorus Compound in (Václav Kubišta), 549
Muscle (Lamellibranch) : Innervation of the (A. Abrahám and E. Minker), 925
Muscle (Plain-) Stimulant in the Menstruum (Dr. W. R. Pickles), 1198
Muscle (Smooth) : Mechanism of Contraction of, by Drugs (Dr. D. H. L. Evans and Dr. H. O. Schild), 341
Muscles (Lamellibranch) : Paramyosin Elements in (G. F. Elliott, Dr Jean Hanson and Dr J. Lowy), 1291
Muscles (Smooth) : Structure of (Dr Jean Hanson and Dr J. Lowy), 906
Muscular Dystrophy (Nutritional), in the Rabbit : Ineffectiveness of Selenium in the Treatment of (Prof. H. H. Draper), 1419
Museum of Applied Arts and Sciences, Sydney : Annual Report for 1956, 1324
Museum Service : A Regional, 836
Museums : Heating and Ventilation of (Dr. A. E. A. Werner), 1324
  Indonesian (J. Irwin), 467
  Natural and Artificial Lighting in (W. E. Rawson-Bottom and B. S. Cooper), 1323
Museums in Britain (R. B. Southall and Prof. Hugh O'Neill), 1146
Museums Association : Annual Conference (Dr. F. S. Wallis), 419
  Proposal for a Regional Museum Service in the south-west of England, 836
Museums and Art Galleries in Britain, 769
Museums (National), of Southern Rhodesia : Annual Report for 1956, 585
Mushroom Beds (Cultivated) : Effects of Gamma-ray Irradiation on Nematodes infesting (F. C. Wood and J. B. Goodey), 760

Mushroom Compost · *Heleococcum aurantiacum*, an Uncommon Weed Fungus of (F. C. Wood), 283
Muskrat in Hu Ma District, North-eastern China : Occurrence of the (Prof. T. H. Shaw), 1215
Mustacchi, H. and others : Structure of the Liquid-Crystal Phases of the Soap—Water System—Middle Soap and Neat Soap, 600
Mutagenic Response to the Alkyl-Methanesulphonates during Spermatogenesis in *Drosophila melanogaster* (Dr. O. G. Fahmy and Dr. Myrtle J. Fahmy), 31
Mutant (Deficient) : Protoplasts of *Escherichia coli* as Sources and Acceptors of Deoxypentose Nucleic Acid—Rehabilitation of a (Prof. Erwin Chargaff, Herbert M. Schulman and Dr. Herman S. Shapiro), 851
Mutation-rate in Man (Spontaneous) : Gonad Temperature and (Dr. Lars Ehrenberg, Gunter von Ehrenstein and Arne Hedgran), 1433
Mutations (Gene), in Human Haemoglobin—the Chemical Difference between Normal and Sickle Cell Haemoglobin (Dr. V. M. Ingram), 326
Mutations (Lethal) Autonomous Action of, Induced in the Germ Cells of *Drosophila melanogaster* by 2-Chloroethyl Methanesulphonate (C. E. Purdom), 81
Mycorrhizas (Vesicular-Arbuscular), in Apple Seedlings (Dr. Lilian E Hawker and Angela M Ham), 998
Myoglobin of the Cow : Amino-Acid Composition of Adult and Foetal (R. Timmer, H. J. van der Helm and Dr. T. H. J. Huisman), 239
Myoglobins from Sheep Homozygous for Different Haemoglobin Types (H. J. van der Helm, R. Timmer and Dr T. H. J Huisman), 240

NADEL, M. B. J : Biological Rhythms (The Biological Age of Man), 1101
Nadkarni, Dr. G. B., and others . Vitamin B_{12} and the Metabolism of Pyridine Nucleotides, 659
Nagler Medium . A Modified (A. T Willis and G. Hobbs), 92, *erratum*, 220
Nagy, A , and others : Control of Humoral Factors of the Zona Glomerulosa of the Adrenal Cortex, 1481
Nasmith, W. E. F , and others : The Arachin Molecule, 971
Nakashima, Miyoshi, and others : Effect of Angiotonin on the Distribution of Sodium, Potassium and Water in the Rat, 194
Nannfeldt, Prof. J. A. : Address at the Linnean Anniversary Celebrations, 739
Narayana Rao, K. V., and Pampapathi Rao, Dr. K · Differences in the Food of the Young and the Adult Indian Mackerel, *Rastrelliger kanagurta* (Cuv.), 711
Narayanan, P. S., and others . Adiabatic Piezo-Optic Coefficient of Heavy Water, 497 ; *erratum*, 953
Narayanaswami, S. (LaRue, C. D., and) : Auxin Inhibition in *Lunularia*, 218
Narayanaswamy, Dr. C. K., and others : Adiabatic Piezo-Optic Coefficient of Heavy Water, 497 ; *erratum*, 953
Narcotic Activity of Optical Enantiomorphs of Methylpentynol (J. R. Hickman and Dr. P. G. Marshall,) 1053
Narcotine : Determination of Papaverine and, by using Ammonium Reineckate (Dr. Lee Kum Tatt and Dr. Charles G. Farmilo), 1288
Narurkar, M. V., and others : Influence of Post-Irradiation Administration of Methionine on the Levels of Deoxyribonucleic Acid in Bone Marrow, Spleen and Liver of Rats, 193
  Choline-Oxidase Activity of Host-Livers of Tumour-bearing Animals, 1128
Nash, Dr. T. : Micelles of Long Life—a Step towards Biological Organization, 188
Nath, Prof. Vishwa : The Golgi Controversy, 967
National Academy of Sciences, India : Election of Dr. Gerhard Herzberg as an Honorary Fellow, 1098
National Academy of Sciences (United States), and the National Research Council : International Symposium on Military Psychology, 534
National Association of Mixed Clubs and Girls' Clubs : To establish a Dr Macalister Brew Scholarship Fund, 314
National Bibliography of Nigeria, 786
National Certificate Courses : Electro-Technology for (Dr. H Buckingham and E. M. Price), Vol. 2, *review* by Dr. P F Soper, 1309
National Coal Board : Conference on the Mechanical Properties of Non-Metallic Brittle Materials, 412
  Gift of £3,000 to the University College of North Staffordshire, for research in the stratigraphy of the North Staffordshire coalfield, 688
  Grants to the Department of Physical and Inorganic Chemistry in the University of Bristol of £1,000 and £750 for the study of the reactivity of carbon surfaces with oxygen and a study of the structure of active carbons, 1171
National Coal Board's Pneumoconiosis Field Research (Dr J W. J. Fay), 309
National Committee for Non-Destructive Testing, British, 169
National Conference for the Preservation of the Countryside : Eighteenth (Rural Problems of the Moment), 531
National Economy : Coal and Coal Chemicals in the (Dr. J. Bronowski), 636
  Dalton Exhibition of the Royal Institute of Chemistry, 637
National Food Survey Committee : Annual Report of the (Domestic Food Consumption and Expenditure, 1955), (Ministry of Agriculture, Fisheries and Food), 587
National Institute of Agricultural Botany : Report for 1956, 736
National Institute of Industrial Psychology (Institute of Personnel Management and the) : Course in the Use of Statistics in Personnel Management, 220
National Institute of Mental Health, United States : Information Service on Psychopharmacology to be established by the Psychopharmacology Service Centre, 735
National Institute for Research in Nuclear Science : Work on the, 315
  Proton-Synchrotron at Harwell, 784
  New Laboratory to be called the Rutherford High Energy Laboratory, 1391
  Appointment of Dr. T. G. Pickavance as first director of the Rutherford High Energy Laboratory, 1391
National Institute for Research in Dairying · Report for 1956, 965
National Laboratory of Civil Engineering, Lisbon : Grant of £250,000 from the Calouste Gulbenkian Foundation, Lisbon, to build and equip the Calouste Gulbenkian Institute, for fundamental investigations in civil engineering, 1027
National Museum, Bloemfontein : Researches of the, Vol. I, Part 10, Fossil Suid Material recovered from the Florisbad Deposit (R. F. Ewer), 1393
National Museums of Southern Rhodesia : Annual Report for 1956, 585
National Park : Serengeti (Tanganyika), 584
National Physical Laboratory · Open Days (A J. Garrett), 166
  Appointment of G. H. Hinds as a member of the General Board, 316
  Symposium on Visual Problems of Colour, 1395
National Research Council, United States (National Academy of Sciences and the) : International Symposium on Military Psychology, 534
National Research Council of Canada and the Chemical Institute of Canada : Eighth Canadian High Polymer Forum, 838
National Science Foundation, United States : Appointment of Dr. E A. Eckhardt as assistant director, for the Division of Mathematical, Physical and Engineering Sciences, 169
  Availability of publications, 316
  Award of £10,000 to Aslib for research into the comparative efficiency of various indexing and literature search systems, 217
  Fellowship Awards in 1958-59, 837
  A Bibliography for the International Geophysical Year, *review* by G. A. Bull, 1155
  Appointment of Dr. B. W. Adkinson as head of the Office of Scientific Information, 1237
National Science Foundation, United States, and others Third Biennial Carbon Conference, 571
  Programme to improve the quality of Physics taught in American Schools and Colleges, 1452
National Science Foundation (United States), and others (A Symposium sponsored by the) : Recent Advances in Invertebrate Physiology (edited by Bradley T. Scheer), *review* by Prof. V. B. Wigglesworth, 1309
National Union of Teachers · Pamphlet on Advice on Careers, 530
National Vegetable Research Station : Formation of a National Vegetable Research Station Association, 530
National Wage and Salary Policy in Britain (Dr. Elliott Jaques), 525
Nationalized Industries In Britain : Reports of the, 1321
Native *Solanum* Species : Infection of, by the Potato Blight Fungus (C. M. Driver), 1367
Natural Gas in Scotland (T. S Ricketts and D. C. Elgin), 1444
Natural History Societies · School, 276
Natural History Societies (School), Association of : Ninth Annual Exhibition (O. N Bishop), 1399
Natural Occurrence of a New Aldoheptose Sugar (Dr. D. A. L. Davies), 1129
Natural Philosophy : The Foundation of (J. G. Bennett), (The Dramatic Universe, Vol. I), *review* by Dr. S Raimes, 302
Natural Pigments : Spectroscopy of the (Photoelectric Spectrometry Group and the Photobiology Group Joint Meeting on), 363
Natural Products · Biogenesis of (British Association for the Advancement of Science, Section B (Chemistry), Symposium on), 679
Natural Resources : The Conservation of (Lectures at the Institution of Civil Engineers), 687
  Search for and Use of, 735
Natural Resources, International Union for the Conservation of Nature and : Proceedings of the sixth Technical Meeting, 584
Natural Rubber Industry—Research and Development (Prof. G. Gee), 743
Natural and Artificial Lighting In Museums (W. E. Rawson-Bottom and B. S. Cooper), 1323
Nature : Linnaeus's Conception of (Prof. N. von Hofsten), 743
  A Suggested Statistical Model of some Time Series which occur in (Dr. H. E. Hurst), 494
Nature from the Amoeba to Man : Seeds of Life—the Story of Sex in (John Langdon-Davies), *review* by T. H. Hawkins, 159
Nature of the Bactericidal Agent in Sea Water (J. K Johannesson), 285
Nature of Immune Responses in Parasitism (Parasitology Group of the Institute of Biology Discussion on), 637
Nature of the Lunar Surface (John J. Gilvarry), 911
Nature of the Product condensed at Low Temperatures from Dissociated Peroxide Vapour (R. L Allen and Dr. F. S. Stone), 752
Nature (Chemical), of the Fluorescent Pigment produced in *Microsporum*-infected Hair (Prof. Frederick T. Wolf), 860
Nature (Chemical), of Parathyroid Hormone (Howard Rasmussen and Roland Westall), 1429
Nature (Identical), of the Leucocyte Antigens detectable In Monozygotic Twins by means of Immune Iso-Leuco-agglutinins (J. Dausset and H. Brecy), 1430
Nature and Natural Resources, International Union for the Conservation of : Proceedings of the sixth Technical Meeting, 584
Nature Conservancy : New Nature Reserves in England and Wales, 78
  Research Studentships for Postgraduate Training in Ecology (Awards for 1957), 467
  Proceedings of the sixth Technical Meeting of the International Union for the Conservation of Nature and National Resources, 584
Nature Conservation, 584
Nature Photography : Exhibition of (Royal Photographic Society), 892
Nature Reserves : Britain's (E. M. Nicholson), *review*, 1267
  New, In Britain, 78
Nature Reserves, Society for the Promotion of : Fortieth Annual Report, 530
Naval Research, United States Office of, and others : Third Biennial Carbon Conference, 571
Navigation, Institute of, and others · Joint Meeting on the Avoidance of Collision by Airborne and Shipborne Means, 213
Navigation, Institut Français de, and others · Joint Meeting on the Avoidance of Collision by Airborne and Shipborne Means, 213
Naylor, A., and others : Mucopolysaccharides from Cartilage and Nucleus Pulposus, 1341
Naylor, E. : Introduction of a Grapsoid Crab, *Brachynotus sexdentatus* (Risso), into British Waters, 616
Naylor, Dr. Margaret : An Acetocarmine Squash Technique for the Fucales, 46
Near-Eastern Adventures, *review* by M. C. Burkitt, 1154
Nearest East : Adventures in the (Prof. Cyrus H. Gordon), *review* by M. C. Burkitt, 1154
Neary, Dr. G J. · Dependence on Oxygen and Temperature of the Sensitivity of Broad Bean Roots to γ-Radiation, 248
Neary, Dr. G. J , and others : Radiosensitivity of Salt Uptake in Plants, 556

Neat Soap (Middle Soap and) : Structure of the Liquid-Crystal Phases of the Soap—Water System— (Dr. V. Luzzati, H. Mustacchi and A. Skoulios), 600
Neatby, K. W. : Our Debt to the Future (The Penalties of Ignorance of Man's Biological Dependence), 259
Nebendahl, the late Miss : Bequest of £1,000 to the University of Bristol Cancer Research Fund, 1171
Neden, Sir Wilfrid, and others : Vitality in Administration, 153
Nederlandse Chemische Vereniging, Koninklijke (Gas Chromatography Discussion Group of the Institute of Petroleum and the) : Symposium on Gas Chromatography, 838
Needham, Dr. A. E. : The Quadratic Relation in Differential Growth, 1293
Needs of Development : Amenities, Rights of the Individual and the, 819
Needs (Modern) : Education for, 1149
Neeteson, P. A. : Analysis of Bistable Multivibrator Operation—the Eccles-Jordan Flip-Flop Circuit, *review* by Dr. R. L. Smith-Rose, 401
Negative Temperature Coefficient of Reaction : Oxidation of Pentane in Mixtures with Air and the (R. O. King, S. Sandler and R. Strom), 335
Negro : Diego Blood Group in (Dr. P. C. Junqueira and P. J. Wishart), 341
Nekrasova, S. V., and others : Combined Light and Velocity Measurements of the Variable Star 12 Lacertae, 1112
Nelson, Werner L. (Tisdale, Samuel L., and) : Soil Fertility and Fertilizers, *review* by Dr. A. M. Smith, 3
Nematode *Heterodera schachtii* Schmidt (Sugar-beet) : Chromosome Number in the (Roland H. Mulvey), 1212
Nematodes infesting Cultivated Mushroom Beds : Effects of Gamma-ray Irradiation on (F. C. Wood and J. B. Goodey), 760
Neolithic Revolution : Exhibit on the (British Museum (Natural History)), 70
Neoplasms in the Mammary Tissue of the Rat : Influence of Hexanitrodiphenylamine on the Incidence of (G. J. van Esch, H. H. Vink and H. van Genderen), 509
Neoplastic and Normal Chicken Tissues : Internal Structure of the Virus-like Particles associated with the Rous Sarcoma, and their Presence in other (Prof. Ch. Oberling, W. Bernhard and Ph. Vigier), 386
Nephrocalcinosis (Experimental) : Sensitization by Œstradiol to the Production of (Prof. H. Selye), 1420
Neptunea antiqua : An Acetylcholine-like Salivary Poison in the Marine Gastropod (Dr. Ragnar Fänge), 196
Nerurkar, M. K., and others : Influence of Post-Irradiation Administration of Methionine on the Levels of Deoxyribonucleic Acid in Bone Marrow, Spleen and Liver of Rats, 193
Nerve (Clamped Vertebrate) : Membrane Currents in (José del Castillo, J. Y. Lettvin, W. S. McCulloch and W. Pitts), 1290
Nerve (Normal Sciatic) : Histochemical Appearances of Cholinesterase in the, and the Changes which occur after Nerve Section (Dr. R. S. Snell), 378
Nerve Cell (Single), in the Lobster : Two Inhibitory Fibres forming Synapses with a (Dr. A. S. V. Burgen and Dr. S. W. Kuffler), 1490
Nerve Cells : The Physiology of (Prof. John Carew Eccles), *review* by Prof. Ragnar Granit, 724
Nerve Endings : Chemical Transmission at (Sir Lindor Brown), 484, 627
Nerve Fibres : Transmission of Trophic Stimuli along Developing (Dr. Arthur Hughes and Pierre André Tschumi), 999
Nerve Fibres (Somatic and Autonomic), in Tissue Sections : Differentiation of (A. D. Dixon), 709
Nerve Regeneration (Mammalian) : Temperature Effects in (Dr. H. J. Gamble), 146
Nerve Section : Histochemical Appearances of Cholinesterase in the Normal Sciatic Nerve and the Changes which occur after (Dr. R. S. Snell), 378
Nerve-Impulse Transmission at a Crayfish Synapse : Mechanism of (Dr. E. J. Furshpan and D. D. Potter), 342
Nervous System : The Analysis of the (Lord Adrian), 1028
  Evolution of Organization in the (Prof. J. Z. Young), 480
  Structure and Functioning of the (British Association for the Advancement of Science, Section D (Zoology), Symposium on), 1388
Neu, G. E. : High Polymer, Colloid and Surface Chemistry (Adsorption of High Polymers on Solids), 960
Neuhaus, H. : Band Spectrum of Gallium Hydride and Gallium Deuteride, 433
Neumann, Dr. Gert, and others : Action of Blue Light on the Germination of Seeds, 609
Neumann, Prof. W., and Habermann, E. : Clearing Action of Lysolecithin, 1284
Neurath, H. : Protein Structure and Biological Activity, 834
Neuro-Psycho-Pharmacology, International Collegium for : Foundation of an, 1324
Neuroanatomy : Quantitative, *review* by Prof. B. Delisle Burns, 106
Neuroendocrinology : Hormones, Brain Function and Behavior—Proceedings of a Conference on (New York, 1956), (edited by Hudson Hoagland), *review* by Dr. Marthe Vogt, 304
Neurohypophysial Osmoreceptors in the Dog : An Experimental Attempt to Determine the Site of the (P. A. Jewell and Prof. E. B. Verney), 129
Neuromuscular Transmission : Adrenaline and Failure of (K. Krnjević and R. Miledi), 814
Neurones (Vacuolated) : Significance of, in the Medulla of Sheep affected with Scrapie (I. Zlotnik), 393
Neuropharmacology, *review* by Dr. Marthe Vogt, 304
Neuropharmacology—Transactions of the Josiah Macy Jr. Foundation Second Conference on (Princeton, 1955), (edited by Prof. Harold A. Abramson), *review* by Dr. Marthe Vogt, 304
Neurophysiology and the Intracellular Technique, *review* by Prof. Ragnar Granit, 724
Neurospora : Effects of Molybdenum and Copper on some Enzymes in (K. Commissiong and Dr. D. J. D. Nicholas), 555
Neurotic Interaction in Marriage (edited by Victor W. Eisenstein), *review* by Dr. Clifford Allen, 4
Neutral Grounding in High-Voltage Transmission (Dr. R. Willheim and M. Waters), *review* by Dr. J. S. Forrest, 1379
Neutral Media (Acid and) : A Unified Theory of the Mechanism of Inhibition of Corrosion of Iron in, based on the Electrocapillary Behaviour of Ions (C. P. De), 803
Neutrophils (Rabbit) : The Sex-linked Difference in (P. J. Carpentier, L. A. M. Stolte and M. J. Dobbelaar), 554
Neuworth, M. B. (Depp, E. A., and) : At the Second International Conference on Coal Science (Pyrolysis of Model Compounds thought to embody the type of Chemical Structure that exists in Coals), 419
Nevard, E. H. (Cook, C. D., and), and others : Timber Preservation by Copper Compounds, 1081
Nevenzel, J. C., and others : Bibliography for 1953 and 1954 of Syntheses of Compounds containing Carbon Isotopes, 636
Neville-Jones, D. : Fresh Water from Salt Water, 171
  Taste and Smell, 274
New Aldoheptose Sugar : Natural Occurrence of a (Dr. D. A. L. Davies), 1129
New Atomic Patents, 784
New Bacteriophages for Bacterial Pathogens of the Bean : Two (Z. Klement), 41
New Compound of Univalent Cobalt (Dr. A. A. Vlček), 753
New Cosmology, *review* by Dr. S. Raimes, 302
New Crystallite Orientations of Cellulose I in *Spirogyra* Cell-walls (Dr. D. R. Kreger), 914
New Element Nobelium—Preparation of Trans-Uranium Elements (H. A. C. McKay), 1010 ; The Preparation of Nobelium (Dr. J. Milsted), 1012
New Ferroelectric Material, Triglycine Sulphate (Bell Telephone Laboratories, New York), 19
New Guinea : Birds of (Tom Iredale), *review* by Dr. A. J. Marshall, 675, 787
New Haemoglobin Variant exhibiting Anomalous Electrophoretic Behaviour (Rose G. Schneider and Mary Ellen Haggard), 1486
'New' Kell Blood-Group Phenotype (Dr. Bruce Chown, Marion Lewis and Kiroko Kaita), 711
New Metallic Layer Structure (J. F. de Wet), 1412
New Methods and Techniques for the Communication of Knowledge (Dr. H. Coblans), 735
New Nature Reserves in Britain, 78
New Pathways in Cellular Pathology (Prof. Gordon Roy Cameron), *review* by Prof. J. H. Gaddum, 59
New Physics : The, *review* by Prof. M. H. L. Pryce, 156
New Pyridine Nucleotide isolated from *Penicillium chrysogenum* : Structure of a (Giovanni Serlupi-Crescenzi and Alessandro Ballio), 1203
New Radio Research Station, Ditton Park, Slough (Dr. R. L. Smith-Rose), 163
New Reactions (Some), and Possibilities in Peptide and Protein Chemistry : Thiols, Disulphides and Thiosulphates— (Dr. J. M. Swan), 643
New Research Headquarters of Thomas Hedley and Co., Ltd. (Dr. E. R. Wilson), 364
New Scientist : First anniversary issue, 1095
New Species of Coccidium (*Eimeria rissae* n. sp. Eimeriidae, *Sporozoa*) from the Kittiwake, *Rissa tridactyla tridactyla* (L.), (Dr. E. J. L. Soulsby and A. R. Jennings), 1057
New Submarine Mountain in the Pacific Ocean (I. V. Sergeev and G. B. Udintzev), 530
New Technique for the Study of Laboratory Population of *Drosophila* (J. A. Thomson), 1495
New Thiol in Legumes (Dr. C. A. Price), 148
New s-Triazine Herbicides (Dr. H. Koopman, J. H. Uhlenbroek and J. Daams), 147
New Type of Carcinostatic Agent (Prof. L. V. Heilbrunn, T. R. Tosteson, E. Davidson and W. L. Wilson), 924
New Type of Nitrogen-fixing Bacterium (A. B. Roy and M. K. Mukherjee), 236
New University Architecture : Exhibition of, at the University of London (University Architecture Exhibitions Committee and the Arts Council of Great Britain), 891
New York Academy of Sciences : The Pharmacology of Psychotomimetic and Psychotherapeutic Drugs—Conference held by the Section of Biology, 1956 (consulting editor, Seymour S. Kety), *review* by Dr. Marthe Vogt, 304
  Conference on the Effects of the Sulphonylureas and related Compounds in Experimental and Clinical Diabetes, 584
New Zealand Civil Services Fellowships : Australian and (Commonwealth Fund, New York), 585
New Zealand Forest Service : Annual Report for 1954-55 of the Forest Research Institute, 272
New Zealand Journal of Science and Technology : To be replaced by the *New Zealand Journal of Agricultural Research*, the *New Zealand Journal of Geology and Geophysics* and the *New Zealand Journal of Science*, 1239
New Zealand Scientific Liaison Office : Appointment of B. W. Collins as scientific liaison officer in Great Britain, 220
Newborn Goat : Evidence of a Second Foetal Haemoglobin in the (Dr. T. H. J. Huisman, H. K. A. Visser and H. J. van der Helm), 758
Newer Metals : The (Royal Institute of Chemistry, the Chemical Society and the Society of Chemical Industry Joint Symposium on), 637
Newitt, Prof. D. M. : Chemical Engineering Education, 127
Newkirk, B. L. : Lubrication and Wear (Hydrodynamic Lubrication), 1448
Newman, E. I. : Awarded a Nature Conservancy Research Studentship for Postgraduate Training in Ecology (Botany), 467
Newman, Prof. M. S. : Solvent Effects and Reaction Mechanism, 535
Newman, Prof. M. S. (edited by) : Steric Effects in Organic Chemistry, *review* by Dr. P. B. D. de la Mare, 822
Newton, Dr. J. D., and Said, Anwar : Molybdenum Deficiency in Latosols of Java, 1485
Newton, Prof. Lily : Marine Algae of the Northeastern Coast of North America, *review*, 1268
Niah : The Cave of, Borneo (Tom Harrisson), 1452
Nichol, L. W., and others : High Polymer, Colloid and Surface Chemistry (Electrophoretic Fractionation of the Albumin of Egg White), 961
Nicholas, Dr. D. J. D. : Trace Elements in Soils, Plants and Animals (Deficiency of Molybdenum), 23
Nicholas, Dr. D. J. D. (Commissiong, K., and) : Effects of Molybdenum and Copper on some Enzymes in *Neurospora*, 555
Nicholas, Dr. W. L. : Awarded a Rockefeller Travelling Fellowship in Medicine for 1957-58 by the Medical Research Council, 315
Nicholls, Dr. J. R., and Frazer, J. R. : Flour and Bread (Analytical Problems in the Determination and Control of Extraction-rates of Flour), 318
Nicholls, Prof. R. W., and Reeves, E. M. : Luminescence produced in Air by Polonium-210 α-Particles, 1188
Nicholson, Dr. D. C. (Gray, Prof. C. H., and) : Structure of *d*-Urobilin, 336
Nicholson, E. M. : Britain's Nature Reserves, *review*, 1267

Nicholson, Dr. Seth B : Retirement from the Mount Wilson and Palomar Observatories, 360 ; work of, 360
Nicol, Dr. A. D. I . Supply of Trained Men and Women, 306
Nicol, Bruce M. · Ascorbic Acid Content of Baobab Fruit, 287
Nicol, J. A C. : Researches in Marine Biology (Luminescence in Polynoid Worms), 746
Nicol, Prof T., and Bilbey, D L. J : Physiopathology of the Reticulo-Endothelial System, *review*, 1155
Nicol, Prof. T., and others Effect of Experimental Biliary Obstruction on the Phagocytic Activity of the Reticulo-Endothelial System, 503
Nicolai, Dr E. : Wall Deposition in *Chaetomorpha melagonium* (Cladophorales), 491
Nicolet, Dr. M. : The International Geophysical Year, 7
Nicotinic Acid : Isolation of the Bound Form of (Prof B. C. Guha and M. L. Das), 1285
Nigeria : A Die-back of Cacao Seedlings in, caused by a Species of *Phytophthora* (S. R. Chant), 1494
National Bibliography of, 786
Nigeria, Federation of : Annual Report on Forest Research and the Forest School (1954-55), 272
Nigeria (Southern) : Honey Bees in (Dr J. Birket-Smith), 511
Nigeria (Western Region of) : Report of Forest Administration for 1954-55, 272
Nigerian Cotton, 315
Nigerian Geographical Journal, Vol. I, No 1, 1238
Nigerian Publications (1956), 786
Night-Vision Efficiency · Individual Differences in (M H. Pirenne, F. H. C. Marriott and E. F. O'Doherty), 228
Nikitovitch-Winer, M., and Everett, J W : Resumption of Gonadotrophic Function in Pituitary Grafts following Retransplantation from Kidney to Median Eminence, 1434
Nikuni, Ziro (Hizukuri, Susumu, and) : Micelle Dimension of Potato Starch, 436
Ning-yang, Dr. Chen, and Dao-lee, Dr Tsung · Awarded Jointly the Nobel Prize for 1957 for Physics, 951 ; work of, 951
Nishimura, Mitsuo, and Takamatsu, Ken : A Carotene-Protein Complex isolated from Green Leaves, 699
Nissan, Prof. A. H., and Kaye, W. G. · Mechanism of Drying of Thick Porous Bodies during the Falling-Rate Period, 142
Nitrates : Reaction of, with Liquid Sulphur Dioxide (Dr. K. J. Ivin), 90
Nitric Oxide : Effect of, on the Radiosensitivity of Bacteria (P. Howard-Flanders), 1191
Nitride (Boron) Crystals : Evidence from Moiré Patterns of Packing Faults in (Dr. J. F Goodman), 425
Nitride (Silicon) : Crystal Structures of (D. Hardie and Dr. K. H. Jack), 332
Nitro Compounds (Aromatic) : Group Localization Energy and Polarographic Half-Wave Potentials of (Dr Sadhan Basu and Jayanti Nag Chaudhuri), 1473
Nitrofurazone : Site of Reduction of, by Bacteria (Dr. A. H Beckett and Ann E Robinson), 1206
Nitrogen (Active) : Spectra of Flames supported by (K R. Jennings and Dr. J. W. Linnett), 1272
Nitrogen (Elementary) : Mass-Spectrometric Assay of (Dr. J. B. Capindale and Dr. D. H. Tomlin), 701
Nitrogen Fixation by a Species of *Pullularia* (Dr. Margaret E. Brown and Dr. George Metcalfe), 282
Nitrogen-fixing Bacterium : A New Type of (A. B. Roy and M. K. Mukherjee), 236
Niven, Dr Janet S F. (Armstrong, Dr. J. A., and) : Fluorescence Microscopy in the Study of Nucleic Acids—Histochemical Observations on Cellular and Virus Nucleic Acids, 1335
Njaa, Leif Rein, and others Effect of Relative Humidity on Rat Breeding and Ringtail, 290
Njoku, E Leaf Shape, Nutrition and Temperature of *Ipomoea*, 1453
Noakes, D S. P. : Report on the Federal Forest Administration of the Federation of Malaya for 1955, 272
Noakes, G. R. : Recent Advances in Science, *review*, 206
'Nobecutane' : Use of, in attaching Skin Electrodes (Flight-Lieut. M. Kennedy Browne), 192
Nobel Prize for 1957 for Chemistry awarded to Sir Alexander Todd, 951
Nobel Prize for 1957 for Physics awarded jointly to Dr. Chen Ning-yang and Dr Tsung Dao-lee, 951
Nobel Prize for 1957 for Physiology and Medicine awarded to Prof. Daniel Bovet, 951
Nobelium : The New Element—Preparation of Trans-Uranium Elements (H. A. C. McKay), 1010 ; The Preparation of Nobelium (Dr. J. Milsted), 1012
Nodules (Root), of *Casuarina* (G. Bond), 1238
Noise Flow (Acoustics Group of the Physical Society and the North-Eastern Branch of the Institute of Physics Discussion on), 893
Noise (Radio) : Sources of, on the Planet Jupiter (C. H. Barrow, T. D Carr and Prof. A. G Smith), 381
Noise (Radio), from Planets (F. Horner), 1253
Noise (Solar) : Short Time Transients in (T de. Groot), 382
Noise (Solar Radio) : Duration of Transients in (O. Elgaroy), 808
Frequency Drift of Short-Time Transients in (O. Elgaroy), 862
Noise and the Visual Threshold (M. G. Bulmer and C. I. Howarth), 1403 ; (Violet Cane and R L Gregory), 1404 ; (H B Barlow), 1405
Nolan, N J (Dugg, G. H , and) : Growth and Morphogenesis in Canadian Forest Species, 1393*
Nomenclature Zoological, 412, 687, 1453
Non-Destructive Method of Detecting Diseases in Wood (J. S. Ward and M. J. Woodman), 47
Non-Destructive Technique for Locating Amino-acids (E. R. Cook and M Luscombe), 708
Non-Destructive Testing, British National Committee for, 169
Non-Enzymatic Transamination on Paper Chromatograms : Differentiation of α-Amino-Acids and Amines by (Dr G. D Kalyankar and Prof. Esmond E. Snell), 1069
Non-haemolytic Jaundice (Congenital, Non-obstructive,) : A Biochemical Lesion in (Dr Julius Axelrod, Dr. Rudi Schmid and Lydia Hammaker), 1426
Non-Linear Differential Equations in Engineering and Physical Sciences : Ordinary (Prof N. W. McLachlan), second edition, *review* by Dr. L. S. Goddard, 58
Non-Metallic Brittle Materials : Mechanical Properties of (National Coal Board Conference on), 412
Non-obstructive, Non-haemolytic Jaundice (Congenital,) : A Biochemical Lesion in (Dr. Julius Axelrod, Dr. Rudi Schmid and Lydia Hammaker), 1426
Non-porous Anodic Films on Aluminium : Structure of (R. W. Franklin), 1470
Non-specific Hydroxylation of Aromatic Amino-Acids by an Insect Cuticle (Prof R Dennell), 1070
Non-specific Immunity (British Society for Immunology Symposium on), 640
Non-stationary State of Polymerization Reactions · A Dilatometric Method of Following the (Dr. W. I Bengough), 1120
Non-Toxicity of Maleic Hydrazide for Mammalian Tissues (Dr J. M. Barnes and Dr. P. N. Magee ; Prof. E. Boyland, Prof. A Haddow and Prof. R. D. Passey ; Prof. W. S. Bullough, Dr. C. N. D. Cruickshank, Dr. M. H. Salaman and Prof. R. T Williams), 62
Non-uniform Radio-frequency Field : Charged Particles in a (Dr. H. A. H. Boot and R. B. R.-S. Harvie), 1187
Noonan, Dr. E. C. (Bryan, Dr. G J., and) : Initiation and Growth of Explosion in Solids (Ignition of Explosive Materials by the Compression of Gas Spaces), 73
Nor-Adrenalin · Use of a Histochemical Technique to demonstrate the Cutaneous Penetration of Adrenalin and (Dr G H. Bourne), 1488
Nordic Institute for Theoretical Atomic Physics , Establishment of the, 1322
Norem, S : Gas Chromatography (Copper Oxide Combustor as a means for Increasing Detector Response), 841
Norinder, H : Ionization Phenomena in Gases (Some New Results on the Mechanism of Lightning Discharges), 792
Normal Chicken Tissues : Internal Structure of the Virus-like Particles associated with the Rous Sarcoma, and their Presence in other Neoplastic and (Prof. Ch Oberling, W. Bernhard and Ph. Vigier), 386
Normal Human Beings and one Totally Colour Blind . Relation of Size of Electroretinogram to Rhodopsin Concentration in (Dr. V. Elenius and Dr J. Heck), 810
Normal Population : Albegraic Transformations to a, 219
Normal Sciatic Nerve : Histochemical Appearances of Cholinesterase in the, and the Changes which occur after Nerve Section (Dr. R. S. Snell), 378
Normal and Adrenalectomized Rats : Influence of Starvation and Glucose Load on the Activity of Liver Phosphorylase in (Dr. N. Schwartz Sorensen), 857
Normal and Pathological Tissues : Histological Technique for, and the Identification of Parasites (H M. Carleton, with the collaboration of R. A. B Drury), third edition, *review* by Prof. H. Brontë Gatenby, 1079
Normal and Sickle Cell Haemoglobin : Gene Mutations in Human Haemoglobin—the Chemical Difference between (Dr V M Ingram), 326
Norris, J R., and Jensen, Prof H. L. : Calcium Requirements of *Azotobacter*, 1493
Norris, K. E. Morphological Studies on the Kallymeniaceae, 113
Norris, K. R . A Method of Marking Calliphoridae (Diptera) during Emergence from the Puparium, 1002
Norrish, Prof. R. G. W. (McGrath, W. D , and) · Production of Vibrationally Excited Oxygen Molecules in the Flash Photolysis of Ozone, 1272
North America : Marine Algae of the North-eastern Coast of (Prof. William Randolph Taylor), second edition, *review* by Prof Lily Newton, 1268
North American Butterflies : Experimental Studies of Mimicry in some (Mrs. Jane Van Zandt Brower), 444
North Atlantic Treaty Organization : Seventh General Assembly of the Advisory Group for Aeronautical Research and Development, 737
North of England : Further Education in the, 1323
North Greenland Expedition (British) : High Arctic—the Story of the (Mike Banks), *review* by Sir Raymond Priestley, 1258
North Pacific Volcanoes, 19
North Sea (Southern) : On the Herring of the (D. H. Cushing and A. C. Burd), 1330
Northern Advisory Council for Further Education : Tenth Annual Report, 1323
Northampton College of Advanced Technology, London : Courses of Lectures on Nuclear Power, 531
Northeastern Coast of North America : Marine Algae of the (Prof. William Randolph Taylor), second edition, *review* by Prof. Lily Newton, 1268
Norway (Britain and) : Collaboration between, in Atomic Energy Developments, 361
Norwegian Institute for Atomic Energy (United Kingdom Atomic Energy Authority and the) : Agreement for co-operation in connexion with the Norwegian Halden Reactor Project, 361
Norwood Technical College, London : Course on Micro- and Semi-Microchemical Methods, 1171

Nozaki, N. (Okubo, Prof. H., and) : Grain-Growth in Metals by Cyclic Stress, 604
Nuclear Age . Anglo-American Relations in the, 1305
Nuclear Chemistry and Effects of Irradiation (Proceedings of the International Conference on the Peaceful Uses of Atomic Energy, Geneva 1955, Vol. 7), *review* by Dr. T. E Allibone, 771
Nuclear Energy : Economics of, *review* by C. A. Rennie, 673
Research and Development in, 397
Nuclear Energy Conference, British Admittance of the Institute of Fuel to membership, 1098
Nuclear Energy Research, Dutch—Norwegian Joint Establishment for Fifth Annual Report (1955-1956), 794
Nuclear Energy and the Growth of Man (Dr. Arthur H Compton), 1157
Nuclear Engineering · Materials for (Physical Society Conference on), 468
Nuclear Fuel Cycles (Institute of Physics Conference on), 1239
Nuclear Fusion : Power from (J. D. Lawson), 780

Nuclear Instrumentation (Sir John Cockcroft), 1178
Nuclear Magnetic Resonance of Methane adsorbed on Titanium Dioxide (Prof. N. Fuschillo and C. A. Renton), 1063
Nuclear Magnetic Resonance Studies of Boron Trifluoride Complex Formation (P. Diehl and R. A. Ogg, jun.), 1114
Nuclear Physics at Oxford, 464
Nuclear Physics : Advances in, *review* by Dr. T. G. Pickavance, 2
  High Energy—Proceedings of the Sixth Annual Rochester Conference, 1956 (compiled and edited by J. Ballam, V. L. Fitch, T. Fulton, K. Huang, R. R. Rau and S. B. Treiman), *review* by Sir John Cockcroft, 303
  Progress in (edited by Prof. O. R. Frisch), Vol. 5, *review* by Dr. T. G. Pickavance, 2
Nuclear Physics and Engineering : Russian—English Glossary of (Consultants Bureau, Inc.), *review* by J. B. Sykes, 569
Nuclear Power (Northampton College of Advanced Technology Courses of Lectures on), 531
  Economics of, including Administration and Law (edited by J. Guéron, J. A. Lane, I. R. Maxwell and J. R. Menke), Vol. I, *review* by C. A. Rennie, 673
Nuclear Power Stations and Public Health Hazards, 1096
Nuclear Radiation Measurements during the International Geophysical Year (Dr. Bert Bolin), 311
Nuclear-resonance Echoes : Audio-frequency (Dr. J. G. Powles and D. Cutler), 1344
Nuclear Science, National Institute for Research in : Work on the, 315
  Proton-Synchrotron at Harwell, 784
  New Laboratory to be called the Rutherford High Energy Laboratory, 1391
  Appointment of Dr. T. G. Pickavance as first director of the Rutherford High Energy Laboratory, 1391
Nuclear Sexing the Cells of the Chorionic Villi : Determination of the Sex of Human Abortions by (Prof. A. C. Stevenson and R. H. McClarin), 198
Nucleic Acid : Effects of Carbon Sources and Base Analogues of, on the Formation of Bacterial Amylase (Juichiro Fukumoto, Takehiko Yamamoto and Daisuke Tsuru), 438
Nucleic Acid (Deoxypentose) : Protoplasts of *Escherichia coli* as Sources and Acceptors of—Rehabilitation of a Deficient Mutant (Prof. Erwin Chargaff, Herbert M. Schulman and Dr. Herman S. Shapiro), 851
Nucleic Acid Derivatives in Soils (G. Anderson), 287
Nucleic Acid Metabolism in Megaloblastic Marrows *in vitro* (Dr. L. G. Lajtha and Dr. T. Kumatori), 991
Nucleic Acid Preparations Induction of Mouse Leukaemia with Purified (Dr. Esther F. Hays, Norman S. Simmons and William S. Beck), 1419
Nucleic Acid Turnover : Survival of Human Circulatory Leucocytes *in vitro*—Life-span and (Dr. J. Malec and Dr. K. Zakrzewski), 551
Nucleic Acid (Tobacco Mosaic Virus) : Terminal Groups of (Dr. K. K. Reddi and Dr. C. A. Knight), 374 ; (Dr. R. E. F. Matthews and Dr. J. D. Smith), 375
Nucleic Acids : Effects of, on Larval Growth, Pupation and Adult Emergence of *Pseudosarcophaga affinis* (Fall.), (H. L. House and J. S. Barlow), 44
  Fluorescence Microscopy in the Study of—Histochemical Observations on Cellular and Virus Nucleic Acids (Dr. J. A. Armstrong and Dr. Janet S. F. Niven), 1335 , Visual Observation of Deoxyribonucleic Acid Changes in Bacteria during Growth of Bacteriophage (Dr. E. S. Anderson), 1336
Nucleic Acids (Cellular) : Changes in, during Infection with Poliomyelitis Virus as studied by Fluorescence Microscopy (Dr. Esther Tenenbaum), 1044
Nucleic Acids (Cellular and Virus) : Histochemical Observations on (Fluorescence Microscopy in the Study of Nucleic Acids), (Dr. J. A. Armstrong and Dr. Janet S. F. Niven), 1335
Nucleoprotein Microfibrils A Lattice Distortion of Alkali Chloride Crystals in the presence of (J. C. White and P. C. Elmes, and V. Balashov, Prof. R. D. Preston and G. W. Ripley), 696
Nucleotide (Dihydro Diphosphopyridine) : Intramolecular Transfer of Electronic Energy in (Dr. G. Weber), 1409
Nucleotide (New Pyridine) : Structure of a, isolated from *Penicillium chrysogenum* (Giovanni Serlupi-Crescenzi and Alessandro Ballio), 1203
Nucleotide (Triphosphopyridine), as a Catalyst of Photosynthetic Phosphorylation (Prof. Daniel I. Arnon, Dr. F. R. Whatley and Dr. M. B. Allen), 182, *errata*, 1325
Nucleotides (Pyridine) : Vitamin B_{12} and the Metabolism of (Dr. G. B. Nadkarni, D. S. Wagle and Prof. A. Sreenivasan), 659
Nucleus of Liver Cells after Partial Hepatectomy . Deoxyribonucleic Acid Content of the (R. Laquerrière), 1199
Nucleus Pulposus : Mucopolysaccharides from Cartilage and (Dr. G. Bernardi, Dr. F. Happey and F. Naylor), 1341
Nuclides (Radioactive and Stable Heavy) : Localization of, in Ocean Sediments (G. Arrhenius, M. N. Bramlette and E. Picciotto), 85
Nuffield Foundation : Report for 1956-57, 896
Nuffield Foundation (Royal Society and) . Awards under the Commonwealth Bursaries Scheme, 119
  Appointment of Dr. P. V. Morley as liaison officer to the joint committee administering grants to assist learned scientific journals, 465
Number of Buttercup Petals : Variation in the (E. A. Potter), 179
Numbers (Prime), from 1 to 10,006,721 : List of (Derrick Norman Lehmer), *review* by Dr. J. C. P. Miller, 520
Numerical Methods (Dr. R. A. Buckingham), *review* by Dr. A. D. Booth, 875
Nurse, E. H. : Solvents, *review*, 258
Nutman, Dr. P. S : Appointed head of the Soil Microbiology Department at Rothamsted Experimental Station, 634 , work of, 634
Nutrients (Macro- and Micro-) Visual Symptoms in *Hevea brasiliensis* of Deficiencies in (Dr. E. W. Bolle-Jones), 362
Nutrition : Drummond Junior Fellowship in, awarded to J. F. D. Greenhalgh, 688
  Effect of Contrasted Planes of, on the Carcass Composition of the East African Dwarf Goat (Dr. P. N. Wilson), 145
Nutrition of the Very Young (Scottish Group of the Nutrition Society Symposium on), 413, 949
Nutrition Society : Symposium on Flour and Bread, 317
Nutrition Society (Scottish Group) : Symposium on the Nutrition of the Very Young, 413, 949
Nutrition and Temperature of *Ipomoea* : Leaf Shape, (E. Njoku), 1453
Nutrition (Molybdenum), and Free Amino-Acids in Tomato (J. V. Possingham), 363
Nutritional Biochemicals Corporation, Cleveland : Catalogue of Research Biochemicals, 1098
Nutritional Muscular Dystrophy in the Rabbit : Ineffectiveness of Selenium in the Treatment of (Prof. H. H. Draper), 1419
Nutritional and Allied Problems confronting the Food Manufacturers : Some (Nutrition Panel of the Food Group of the Society of Chemical Industry Meetings on), 1, Colours and Flavours, 1242
Nutting, Leighton A., and others : Degradation of Biologically Synthesized Lactose labelled with Carbon-14, 915
Nye, Dr. J. F., and others : Lectures at the University of Bristol on Observations of Dislocations in Metals and Inorganic Crystals, 467
Nymphs of the Water Boatman, *Notonecta* : Investigations on the (J. E. Marson), 687

OAKBERG, Dr. E. F : Duration of Spermatogenesis in the Mouse, 1137, 1497
Oberling, Prof. Ch., and others : Internal Structure of the Virus-like Particles associated with the Rous Sarcoma, and their Presence in other Neoplastic and Normal Chicken Tissues, 386
Observatory : The Kiruna Geophysical, Sweden (Dr. Bengt Hultqvist), 828
Observing Fish Viscera *in vivo* : A 'Window' Technique for (G. Burnstock), 1491
Obtaining Clone Cultures of Soil Amoebae in Sterile Liquid Medium : A Technique for (D. Harrison), 1301
Occupational Aspects of Ageing : Psychological and (British Association for the Advancement of Science, Section J (Psychology), Symposium on), 902
Occurrence of *Crepidostomum metoecus* (Braun, 1900) in Britain (Dr. J. D. Thomas), 1492
Occurrence of the Meta-stable Omega Phase in Zirconium Alloys (B. A. Hatt, J. A. Roberts and G. I. Williams), 1406
Occurrence (Natural), of a New Aldoheptose Sugar (Dr. D. A. L. Davies), 1129
Occurrence (Possible), of Strains in Species of Schistosomes (B. Verdcourt), 865
Ocean : The Abyssal Circulation of the (International Union of Geodesy and Geophysics Symposium on), 733
Ocean (Pacific) : A New Submarine Mountain in the (I. V. Sergeev and G. B. Udintsev), 530
Ocean Floor (Deep) : Exploration of the (British Association for the Advancement of Science, Section A (Mathematics and Physics), Discussion on), 778
Ocean Sediments : Localization of Radioactive and Stable Heavy Nuclides in (G. Arrhenius, M. N. Bramlette and E. Picciotto), 85
Oceanic Observations of the Pacific, 1949 (edited by N. W. Rakestraw, Paul L. Horrer and Warren S. Wooster), *review* by Dr. G. E. R. Deacon, 877
Oceanic Trenches : Life in, 687
Oceanography : Pacific, *review* by Dr. G. E. R. Deacon, 877
  Physical, *review* by Dr. G. E. R. Deacon, 1007
O'Connor, A. (Keller, A., and) : Large Periods in Polyethylene—the Origin of Low-Angle X-Ray Scattering, 1289
Octyl Sulphate (Sodium), in Saturated Salt Solutions . Surface Properties of (E. Matijević and J. Rogers), 560
O'Day, M., and others . Ionization Phenomena in Gases (Explosion of Wires by Discharges from Heavy Condensers), 793
Odgers, G. J., and others : Combined Light and Velocity Measurements of the Variable Star 12 Lacertae, 1112
O'Doherty, Prof. E. F. : Bilingualism in Education, 690
O'Doherty, Prof. E. F., and others : Individual Differences in Night-Vision Efficiency, 228
Œdema (Experimental Inflammatory), in Rats : Attempt to Transplant the Œdema Fluid of (Dr. E. Kelemen), 710
Œdema Fluid of Experimental Inflammatory Œdema in Rats : Attempt to Transplant the (Dr. E. Kelemen), 710
Œsophagus : Mast Cells in the Epithelium of the (Dr. F. R. Johnson and R. M. H. McMinn), 615
Œstradiol Sensitization by, to the Production of Experimental Nephrocalcinosis (Prof. H. Selye), 1420
Œstrogen Excretion (Urinary), by the Bull (Weert Velle), 856
Œstrous Cycle of Mice Effect of Exteroceptive Factors on the (W. K. Whitten), 1436
Œstrus in Ferrets . Effect of Cerebral Lesions upon (J. Herbert and Sir Solly Zuckerman), 547
Oeuvres de Lavoisier (recueillie et annotée par René Fric), Fascicule 2, 1770-1775, *review* by Sir Harold Hartley, 1260
Ogawa, Yoshito, and others : Effects of Kinetin on Division of Yoshida Sarcoma Cells, 985
Ogg, Jun., R. A. (Diehl, P., and) : Nuclear Magnetic Resonance Studies of Boron Trifluoride Complex Formation, 1114
Oil Adulteration . Identification of Edible Oils and the Detection of, by Differential Infra-red Spectroscopy (J. C. Bartlet), 1071
Oil Consumption in the United Kingdom, 361
Oil-polluted Birds : Cleansing of (Royal Society for the Prevention of Cruelty to Animals Pamphlet on), 1453
Oils (Edible) : Identification of, and the Detection of Oil Adulteration by Differential Infra-red Spectroscopy (J. C. Bartlet), 1071
Okita, G. T., and others : C_{16}-Hydroxylation of Digitoxin, 607
Okubo, Prof. H., and Nozaki, N. : Grain-Growth in Metals by Cyclic Stress, 604
Olah, A., and others : Control of the Humoral Factors of the Zona Glomerulosa of the Adrenal Cortex, 1481
Old Yellow Enzyme : Effect of Flavin Monosulphate on (Prof. Hugo Theorell, Kunio Yagi, George D. Ludwig and Fujio Egami), 922
Oldroyd, Prof. J. G. : Rheology of Disperse Systems—Complicated Rheological Properties (Presidential Address to the British Society of Rheology), 957
β-1,4-Oligoglucosides : Formation of, by certain *Acetobacter* Species (Dr. Robert Steel and Dr. Thomas K. Walker), 201
Oligosaccharides of Human Milk (Dr. F. H. Malpress and Dr. F. E. Hytten), 1201

Oligosaccharides isolated from Jute α-Cellulose : Examination of the (W. G. Macmillan, A. B. Sen Gupta and A. S. Dutt), 1041
Oliver, Dr. D. R. : Appointed a lecturer in chemical engineering at the University of Birmingham, 738
Oliver, Dr J. H : Production of Carbon in the Sea, 617
Oliver, Dr. R M. : Operational Research (Control of Production and Inventories), 1088
Oliver Memorial Fund : Annual Award for work or services on Blood Transfusion, 316
Olliver, J. G. Appointed technical officer, Survey Department, Kenya, 688
Olomucki, Dr Eugenia : Action of Ethylene Dibromide on Hen Gonadotrophic Hormones, 1358
Omega Phase (Meta-stable) : Occurrence of the, in Zirconium Alloys (B. A Hatt, J. A. Roberts and G. I. Williams), 1406
O'Moore, L. B. : Trace Elements in Soils, Plants and Animals (Cobalt Deficiency), 25
On the Beach (Nevil Shute), *review* by William Cooper, 350
Once round the Sun—the Story of the International Geophysical Year, 1957-58 (Dr. Ronald Fraser), *review* by Dr. M. A. Ellison, 623
Oncley, Dr. J. L., and others : The Harvey Lectures, Series 50 (1954-1955), *review* by Prof. W. Burns, 157
Oncopeltus fasciatus (Dallas) : Sodium, Potassium and Calcium Ions in the Haemolymph of (Prof. James A Mullen), 813
Ondo, Y. : Biological Rhythms (Responses of Shore Sowbugs to the Periodic Movement of Waves), 1102
1 to 10,006,721 : List of Prime Numbers from (Derrick Norman Lehmer), *review* by Dr. J. C P Miller, 520
O'Neill, Prof. Hugh, and Davies, Dr. D. Eurof : Study of Strain Distribution in Metals by the Determination of Local Electrode Potentials, 498
O'Neill, Prof. Hugh (Southall, R. B., and) : Museums in Britain, 1146
Onset and Cessation of Hibernation under Constant Temperature and Light in the Golden-mantled Ground Squirrel (*Citellus lateralis*), (Eric T. Pengelley and Prof. Kenneth C. Fisher), 1371
Ontario Research Foundation Annual Report for 1956, 1104
Onwumechilli, C. A. (Alexander, Prof. N. S., and) : Variation of the Horizontal Force near the Magnetic Equator, 191
Onychium : Cytology of Indian Species of (P N Mehra and S. C. Verma), 715
Oospores of *Phytophthora erythroseptica* : Germination of (Dr. Mary Gregg), 150
Oospores of *Pythium mamillatum* : Germination of, in Response to Exudates from Living Seedlings (Richard Barton), 613
Oosterhoff, P. Th. (edited by) Transactions of the International Astronomical Union, Vol. 9, Ninth General Assembly held at Dublin, 1955, *review* by Prof R. O. Redman, 824
Opacity of the Atmosphere arising from the Alaskan Volcano in 1953 : Records from Table Mountain show clearly the increased (Report for 1955-56 of the Smithsonian Institution), 21
Oparin, Academician A I. : Vegetable Quality (Catechins, Gallocatechins and their Gallates in Tea), 175
Opdyke, N. D., and others : The Geomagnetic Field in Upper Triassic Times in the United States, 1186
Operational Research (Operational Research Society (United Kingdom), the Operations Research Society of America, and the Institute of Management Sciences (New York), Conference on), 363, 1087
Operational Research Society, and others : Conference on Operational Research, 363, 1087
Operational Research and Cybernetics in Industry (Lectures arranged by the Department of Operational Research and Cybernetics of the United Steel Companies, Ltd., in co-operation with the Sheffield College of Commerce and Technology), 72, 531
Operations Research Society of America, and others : Conference on Operational Research, 363, 1087
Ophicephalus punctatus and *Barbus stigma* : Parasitism in relation to the Pituitary of (A. G. Sathyanesan), 98
Ophthalmology and Otology : Alexander Pigott Wernher Memorial Travelling Fellowships in (Medical Research Council Awards for 1957-58), 315
Opie, Dr. Eugene L., and others : The Harvey Lectures, Series 50 (1954-1955), *review* by Prof. W Burns, 157
Opportunities for Girls and Women in Science and Technology (British Federation of University Women Report on), 127
Optica Acta and *Acta Electronica* : Joint publication of the Proceedings of the International Symposium on the Physical Problems of Colour Television (Paris, 1957), 953
Optical Definition of the Metre (Dr. H. Barrell), 1387
Optical Enantiomorphs of Methylpentynol : Narcotic Activity of (J. R. Hickman and Dr. P. G. Marshall), 1053
Optical Rotation and Infra-Red Spectra of some Polypeptide and Protein Films (Dr. A. Elliott, W. E. Hanby and B. R. Malcolm), 1340
Optical Testing : Tower for (Sir Howard Grubb, Parsons and Co., Ltd), 268
Optical-Transform Methods : Direct Structure Determination by (M. M Crowder, K. A Morley and Dr. C A. Taylor), 431
Optics (Prof. Bruno Rossi), *review*, 1269
Optics, International Commission for : International Colloquium on Optics in Metrology, 1172
Optics in Metrology (International Commission for Optics International Colloquium on), 1172
Oral Administration of Plutonium : Absence of Lethal Radiation Effects following Massive (Maurice F. Sullivan and Dr Roy C Thompson), 651
Oral Material : Isolation of *Leptotrichia buccalis* and *Fusobacterium* Species from (A. C. Baird-Parker), 1056
Orbit of the Artificial Earth Satellite, 784
Orbit of the First Russian Earth Satellite : Observations on the (Staff of the Royal Aircraft Establishment, Farnborough), 937, *erratum*, 1028
Orbit of the Second Artificial Earth Satellite, 1026
Orbital Period (Meteor) : A Prediction of a (E. G. Bowen), 737
Orbits (Meteor), and Rainfall, 737
Orchard, Dr. B. (Heath, Dr. O. V. S., and) : Midday Closure of Stomata—Temperature Effects on the Minimum Intercellular Carbon Dioxide Concentration 'Γ', 180
Ordovician Volcanoes (Dr G. H. Mitchell), 480
Order of Merit conferred on Lord Waverley, 1325
Ores : Geochemical Prospecting for, 1453
Organ-Specific Antigen : Role of, during 4-Dimethylaminoazobenzene Carcinogenesis in the Rat Liver (P. E. Hughes, C. J Louis, J K. Dineen and W. G. Spector), 289
Organic Analysis (edited by John Mitchell, Jr., I. M. Kolthoff, E. S. Proskauer and A. Weissberger), Vol. 3, *review* by Dr. W. J. Hickinbottom, 567
  Semimicro Qualitative (Prof. Nicholas D Cheronis and Prof. John B. Entrikin), second edition, *review* by Dr. W. J. Hickinbottom, 567
Organic Analysis (Modern) : An Introduction to (Sidney Siggia and Hans J. Stolten), *review* by Dr. G. M. Bennett, 6
Organic Chemical Analysis (Qualitative) : A Guide to (Prof R. P. Linstead and Dr. B. C. L. Weedon), *review* by Dr. W. J Hickinbottom, 567
Organic Chemistry at Belfast, 1025
Organic Chemistry at Glasgow, 1025
Organic Chemistry (Louis F. Fieser and Mary Fieser), third edition, *review* by Prof. J R. Partington, 352
  Elementary Practical (Dr Arthur I. Vogel), Part I, Small Scale Preparations, *review* by G. Fowles, 569
  Introduction to Structure in (Prof. C. K. Ingold), *review* by G Fowles, 453
  Physical (Prof Jack Hine), *review* by Prof. J. R. Partington, 159
  The Reactive Intermediates of (John E. Leffler), *review* by H. S. Turner, 1269
  Steric Effects in (edited by Melvin S. Newman), *review* by Dr. P. B D. de la Mare, 822
  Technique in, *review* by Dr. W. J Hickinbottom, 567
  Technique of (edited by Arnold Weissberger), Vol. 3, second edition, Part I, Separation and Purification, *review* by Dr. W. J. Hickinbottom, 567
Organic Hydroxy Acids and Silicic and Germanic Acids in Aqueous Solutions : Interaction between (E. R. Clark and J A. Waddams), 904
Organic Phosphate Esters : Changes of, during Glycolysis of Blood followed by a Paper Chromatography Method (Dr. L. Macho), 1351
Organism (Causative), of Kala-azar : Transaminases of *Leishmania donovani*, the (Dr A. N. Chatterjee and Dr. J. J. Ghosh), 1425
Organisms (Pleuropneumonia-like) : Contamination of Stock Lines of Human Carcinoma Cells by (Dr. L. H. Collier), 757
Organization—the Framework of Management (E. F. L. Brech), *review* by Rosemary Stewart, 621
Organization : Management, *review* by Rosemary Stewart, 621
Organization of the Cerebral Cortex (Dr D. A. Sholl), *review* by Prof. B. Delisle Burns, 106
Organization for European Economic Co-operation (European Productivity Agency) : Project Nos 136 and 145, Air and Water Pollution—the Position in Europe and in the United States, *review* by Dr. A. Parker, 451
  The Training of Workers within the Factory, 537
  Report on Labour Management on the Farm, 1461
Organization of the Meteorological Office, 223
Organization in the Nervous System : Evolution of (Prof. J. Z. Young), 480
Organization (Biological) : Micelles of Long Life—a Step towards (Dr. T. Nash), 188
Organo-Clay Complexes (Dr. W. W. Emerson), 48
Organo-phosphorus Insecticides : Ovicidal Action of (K. N. Mehrotra and B. N. Smallman), 97
Organs (Internal) : Development of Multiple Cysts and of Haemorrhagic Affections of, in Albino Rats treated during the Embryonic or Newborn Period with Rous Sarcoma Virus (G. J. Svet-Moldavsky), 1299
Orhan, A : Appointed chief veterinary officer, Cyprus, 21
Oriel, J. A. : Chemical Engineering Education (Opportunities and Recruitment), 127
Orientations (New Crystallite), of Cellulose I in *Spirogyra* Cell-walls (Dr. D. R. Kreger), 914
Oriented Transformations in Iron Oxides and Hydroxides (Prof J. D. Bernal, Dr. D. R. Dasgupta and Dr. A. L. Mackay), 645
Origin of Antibiotic-Resistant Staphylococci (J. C. Gould), 282
Origin of Life on the Earth (International Union of Biochemistry Symposium on), 886
Origin of Low-Angle X-Ray Scattering : Large Periods in Polyethylene—the (A Keller and A. O'Connor), 1289
Origins of Life—Moscow Symposium (N. W. Pirie), 886 ; (Prof. J. D. Bernal), 1220
Orlova, Miss M. P., and others : Low-Temperature Physics (Antiferromagnetism in Anhydrous Sulphates and Carbonates of the Transition Metals), 462
Ornithologists' Union, British : Centenary of the, 1169
Orpin, R. : Appointed agricultural officer, Nyasaland, 413
Orton, Dr. L. H. (Cassie, A M., and) : Appointed joint heads of the Switchgear Department of the Electrical Research Association, 738
Oryctolagus cuniculus (Domestic Rabbit) and Hare (*Lepus europaeus*) : An Attempt to Cross the (Dr. C. E. Adams), 853
Osawa, Dr. Yoshinobu : Conical Paper Chromatography, 705
Osborne, A. D. : Trace Elements in Soils, Plants and Animals (Cobalt Deficiency), 25
Oscillators (Quartz), and their Limitations (Dr. Ponte), 1178
Oscilloscope (Cathode Ray) : An Introduction to the (Harley Carter), *review*, 1270
Oser, Dr. Bernard : Control of Chemical Additives in Food, 694
Osmoreceptors (Neurohypophysial), in the Dog : An Experimental Attempt to Determine the Site of the (P. A. Jewell and Prof E. B. Verney), 129
Ossifying Cartilage : Fractionation of Phosphorus Compounds in (R. G. Whitehead and Dr. S. M. Weidman), 1196
Osteodontokeratic Culture of *Australopithecus prometheus* (Prof. Raymond A. Dart), *review* by Sir Wilfrid Le Gros Clark, 156
Oster, Prof Gerald : Intensification of the Photographic Image, 1275
Oster, Prof. Gerald, and Pollister, Arthur W. (edited by) : Physical Techniques in Biological Research, Vol I, Optical Techniques ; Vol. 2, Physical Chemical Techniques ; Vol. 3, Cells and Tissues, *review* by Prof. J. A. V. Butler, 1009
Otology : Alexander Pigott Wernher Memorial Travelling Fellowships in Ophthalmology and (Medical Research Council Awards for 1957-58), 315
Ottesen, J. : Behaviour and Fate of Lymphocytes (Incorporation of Radioactive Isotopes into the Nucleic Acids of Lymphocytes in the Blood), 1016
Ottewill, Dr. R. H. (Horne, R. W., and) : Electron Microscope Studies on Colloidal Silver Iodide employing Cinematographic Techniques, 910
Otto, W. : Biological Rhythms (Annual Fluctuations in Birth Weight), 1101

Ouchi, Shunji (Shibuya, Shun'ichi, and): Isolation of 2-Aminoethane-sulphinic Acid from a Mollusc, 549
Oundle School Natural History Society: Report, 276
Ourisson, Prof. G., and others: Recent Advances in the Chemistry of Terpenoid Compounds (Structure of Dipterocarpol), 471
Outer Mantle Epithelium of *Arca noae*: Mucous Gland Cells of the (E. R. Trueman), 1492
Ovalbumin: Liberation of Tyrosine Hydroxyl Groups in Urea Solutions of Bovine Serum Albumin and (A. N. Glazer, Dr. H. A. McKenzie and R. G. Wake), 1286
Ovalbumin irradiated with Gamma-Rays: Role of Structural Degradation in the Loss of Serological Activity of (Hugo Fricke, Charles A. Leone and Wendell Landmann), 1423
Ovarian Development Hormone in *Aedes aegypti*: Variation in the Time of Release of the (Dr. J. D. Gillett), 656
Ovarian Interstitial Cell and the Endothelial Lining of the Blood Sinusoids: Subendothelial Space between the (Dr. M. De Groodt, A. Lagasse and Prof. M. Sebruyns), 1431
Ovary: Action of Gonadotrophins on the (Prof. C. W. Emmens, P. J. Claringbold and D. R. Lamond), 38
Oversea Civil Service Fellowships (Commonwealth Fund, New York), 585
Overseas Colleges of Arts, Science and Technology, Council for: Formation of, 267
Overseas Engineers in Britain: Training, 535
Overseas Information Services: White Paper on, 563
Overseas Scholarship Scheme (Federation of British Industries), 635
Overseas Territories (British): Health in, 314
Ovicidal Action of Organo-phosphorus Insecticides (K. N. Mehrotra and B. N. Smallman), 97
Oviducts (Bilateral): Hens with (Prof. Walter Morgan and William Kohlmeyer), 98
Ovipositor (Insect): Reinterpretation of some Basal Structures in the (G. G. E. Scudder), 340
Owen, Dr. D. E.: A Geological Garden constructed at Leeds, 19
  Appointed keeper of the Manchester Museum in the University of Manchester, 411; work of, 411
Owen, Sir Leonard: Appointed managing director of the Industrial Group of the United Kingdom Atomic Energy Authority, 529; work of, 529
Owen, Dr. P. C.: Effect of Ultra-Violet Radiation on the Respiration-Rates of Tobacco Leaves, and its Reversal by Visible Light, 610
  Rapid Estimation of the Areas of the Leaves of Crop Plants, 611
Oxford: Science of Metals at, 1319
Oxford Botanic Garden (T. H. Hawkins), 276
Oxidase (Amine): Occurrence of an, in Horse Serum (Bernadette Bergeret, Dr. Hermann Blaschko and Rosemary Hawes), 1127
Oxidase (Ascorbic Acid): Inhibition of, by Thiourea (Dr. A. M. Mayer), 1417
Oxidase Activity (Xanthine), during Mammary Carcinogenesis in Mice (I. Lewin, R. Lewin and R. C. Bray), 763
Oxidation: Changes in the Structure of Carbon during (J. D. Watt and Dr. Rosalind E. Franklin), 1190
Oxidation of Pentane in Mixtures with Air and the Negative Temperature Coefficient of Reaction (R. O. King, S. Sandler and R. Strom), 335
Oxidation (Hydrocarbon): Point of Attack in (R. Burt, F. B. Ebeid and Dr. G. J. Minkoff), 188
Oxidative Phosphorylation: Relationship between the Hydrolysis of Adenosine Triphosphate and (W. C. Hulsmann and Prof. E. C. Slater), 372
Oxide (Nitric): Effect of, on the Radiosensitivity of Bacteria (P. Howard-Flanders), 1191
Oxide (Tantalum) Bands: Rotational Analysis of the (D. Premaswarup and Dr. R. F. Barrow), 602
Oxide (Zinc): Excess Zinc in (H. J. Allsopp and J. P. Roberts), 603
Oxides (Iron), and Hydroxides: Oriented Transformations in (Prof. J. D. Bernal, Dr. D. R. Dasgupta and Dr. A. L. Mackay), 645
Oximes: Crystal Structure of (Bodil Jerslev), 1410
Oxine and its Derivatives (R. G. W. Hollingshead), Vol. 3, Derivatives of Oxine, Part 1; Vol. 4, Derivatives of Oxine, Part 2, *review* by Dr. G. M. Bennett, 57
Oxygen: Effect of, on the Carrier Life-time in Silicon (D. H. Roberts, P. H. Stephens and P. H. Hunt), 665
  Effects of, upon Light Absorption by Green Algae (Prof. Britton Chance and Bernard Strehler), 747
Oxygen as a Donor Element in Germanium (G. Elliott), 1350
Oxygen, Carotene, etc.: Interactions of Chlorophyll in its Triplet State with (Dr. E. Fujimori and Prof. Robert Livingston), 1036
Oxygen and Temperature: Dependence on, of the Sensitivity of Broad Bean Roots to γ-Radiation (G. J. Neary), 248
Oxygen Molecules (Vibrationally Excited): Production of, in the Flash Photolysis of Ozone (W. D. McGrath and Prof. R. G. W. Norrish), 1272
Oxytocin in the Hypothalamus: A Second (P. A. Robertson and Dr. R. W. Hawker), 343
Oyster Saddle): *Enigmonia aenigmata* Sowerby, a Motile Anomiid (Prof. C. M. Yonge), 765
Ozeanographie: Allgemeine Meereskunde, eine Einfuhrung in die (Gunter Dietrich), *review* by Dr. G. E. R. Deacon, 1007
Ozone: Production of Vibrationally Excited Oxygen Molecules in the Flash Photolysis of (W. D. McGrath and Prof. R. G. W. Norrish), 1272
Ozone (Atmospheric): A Possible Auroral Enhancement of Infra-red Radiation emitted by (Wallace B. Murcray), 139

PABST, A.: At the meeting of the Teaching Commission of the International Congress on Crystallography (Band Groups as Student Exercises), 957
Pacific: Oceanic Observations of the, 1949 (edited by N. W. Rakestraw, Paul L. Horrer and Warren S. Wooster), *review* by Dr. G. E. R. Deacon, 877
Pacific (South): Sugar Industry in the, *review* by Sir Harold Hartley, 1378
Pacific (South) Enterprise—the Colonial Sugar Refining Company, Ltd. (edited by A. G. Lowndes), *review* by Sir Harold Hartley, 1378
Pacific Ocean: A New Submarine Mountain in the (L. V. Sergeev and G. B. Udintzev), 530
Pacific Oceanography, *review* by Dr. G. E. R. Deacon, 877
Pacific Science Board: Tenth Annual Report, 785
Pacific (North) Volcanoes, 19
Packing Faults in Boron Nitride Crystals: Evidence from Moiré Patterns of (Dr. J. F. Goodman), 425
Page, —: Bioclimatology and Biometeorology (Town Planning in relation to Climate), 1328
Page, B. S.: At the Annual Conference of the Library Association (University Library Development), 843

Philosophy of Science : History and, at University College, London, 267
Philosophy of St. Thomas Aquinas : The Christian (Etienne Gilson), translated by L K. Shook, *review* by the Very Rev. W. R. Matthews, 873
Philosophy (Natural) : The Foundations of (J. G. Bennett), (The Dramatic Universe, Vol. 1), *review* by Dr. S. Raimes, 302
Philp, J. McL. (Bellis, D. B., and) : Trace Elements in Soils, Plants and Animals (Pig Feeds), 25
Phoenicopteri : The Filter Feeding and Food of Flamingoes (Penelope M. Jenkin), 128
Phosphatase (Acid), in *Trichonympha turkestanica* Bernstein (Trichonymphina, Trichonymphidae) : Cytochemical Localization of (M. M. El Mofty), 1367
Phosphatase (Alkaline), during Paper Electrophoresis : Location of Alpha-2-Globulin by Demonstration of (Dr William Quitman Wolfson), 549
Phosphate in the Bones of Growing Diabetic Rats : Action of Glucose-1-Phosphate on the Deposition of (Dr. N. Siliprandi, G. De Bastiani, F. Petrelli and B. Fachetti), 1357
Phosphate Esters (Organic) : Changes of, during Glycolysis of Blood followed by a Paper Chromatography Method (Dr. L. Macho), 1351
Phosphates (Mineral) : Solution of, by Soil Bacteria (Joan I Sperber), 994, *errata*, 1454
Phosphodiesterase from Rattle-snake Venom (Prof. M. Laskowski, Gloria Hagerty and Ulla-Riita Laurila), 1181 ; (Dr. Hans G. Boman), 1182
Phospholipid (Chromosomal) : Uptake of Benzpyrene by a (Dr. J. Chayen, L. F. La Cour and P. B Gahan), 652
Phospholipoprotein (Labile) : Evidence for the Formation of a, during the Clotting of Platelet-rich Plasma (Dr. G. V. R. Born), 546
Phosphors · The Bush-activated Sodium Chloride Recrystallization (Z. Morlin), 89
Phosphorus-32 : Incorporation of, into Salivary-type Chromosomes which exhibit 'Puffs' (Julian D Gross), 440

Phosphorus Analyses (Soil). Interference in, by Snail Shells (P. M. McDonnell), 90
Phosphorus Compound (Stable): Accumulation of a, in Glycolysing Insect Muscle (Václav Kubišta), 549
Phosphorus Compounds in Ossifying Cartilage: Fractionation of (R. G. Whitehead and Dr. S. M. Weidman), 1196
Phosphorylase (Liver), in Normal and Adrenalectomized Rats: Influence of Starvation and Glucose Load on the Activity of (Dr. N. Schwartz Sørensen), 857
Phosphorylase (Polynucleotide): Activation of, by Salts (Roland F. Beers, jun.), 246
Phosphorylase Inhibitor in Potato—Separation from Activator and Possible Relation to Chlorogenic Acid (Dr. Sigmund Schwimmer), 149
Phosphorylation (Oxidative): Relationship between the Hydrolysis of Adenosine Triphosphate and (W. C. Hülsmann and Prof. E. C. Slater), 372
Phosphorylation (Photosynthetic): Triphosphopyridine Nucleotide as a Catalyst of (Prof. Daniel I. Arnon, Dr. F. R. Whatley and Dr. M. B. Allen), 182, *errata*, 1325
Photinus pallens (Fireflies): Dried Lanterns from (Medical Research Council Tropical Metabolism Research Unit, University College of the West Indies), 1454
Photobiology Group (Photoelectric Spectrometry Group and the): Joint Meeting on the Spectroscopy of the Natural Pigments, 363
Photochemical Stability of Dyes in the Solid State (Dr. G. S. Egerton and A. G. Roach), 1349
Photochemistry of Polymer Films (Dr. G. S. Egerton and A. G. Roach), 189
Photochlorination of Chloroform (G. Chiltz, G. Martens and A. M. Mahieu), 1068
Photoelasticity: Course in (Department of Civil and Municipal Engineering, University College, London), 21
Photoelectric Spectrometry Group: Annual General Meeting, 363
Photoelectric Spectrometry Group and the Photobiology Group: Joint Meeting on the Spectroscopy of the Natural Pigments, 363
Photographers (British), Institute of: Eighth Conference of the Medical Group, 172
Photographic Densitometry with the Two—Wave-length Method (Dr. Mortimer L. Mendelsohn), 1408
Photographic Image: Intensification of the (Prof. Gerald Oster), 1275
Photographic Observations at the Union Observatory, Johannesburg, 1392
Photographic Society, Royal: Exhibition of Nature Photography, 892
Photographic Society, Royal (Scientific and Technical Group), in collaboration with the Department of Scientific and Industrial Research: Conference on Industrial High-Speed Photography, 1394
Photography: Industrial High-Speed (Scientific and Technical Group of the Royal Photographic Society in collaboration with the Department of Scientific and Industrial Research Conference on), 1394
Photography at Extreme Resolution: Microphotography— (Dr. G. W. W. Stevens), *review* by Dr. R. Barer, 622
Photography (Nature): Exhibition of (Royal Photographic Society), 892
Photolysis (Flash), of Ozone: Production of Vibrationally Excited Oxygen Molecules in the (W. D. McGrath and Prof. R. G. W. Norrish), 1272
Photometric Method for Avian Liver Xanthine Dehydrogenase (Heinz G. Schwartz and Prof. Gerald Litwack), 761
Photons: Correlation between, in Coherent Beams of Light, detected by a Coincidence Counting Technique (R. Q. Twiss and A. G. Little, and R. Hanbury Brown), 324
  Time-correlated (G. A. Rebka, jun., and Prof. R. V. Pound), 1035
Photoperiodicity and Wool Growth in Romney Rams and Wethers (Dr. A. B. Wildman), 296, *erratum*, 1098
Photosensitivity of Haem Compounds (Prof. Q. H. Gibson and S. Ainsworth), 1416
Photosynthesis (British Association for the Advancement of Science, Section K (Botany), Discussion on), 1083
Photosynthetic Phosphorylation: Triphosphopyridine Nucleotide as a Catalyst of (Prof. Daniel I. Arnon, Dr. F. R. Whatley and Dr. M. B. Allen), 182, *errata*, 1325
Phototropism of *Phycomyces* Sporangiophores (M. J. Carlile), 202
Phycomyces Sporangiophores: Phototropism of (M. J. Carlile), 202
Physical Chemistry: Experimental (Prof. Farrington Daniels, Prof. Joseph Howard Mathews, Prof. John Warren Williams, Prof. Paul Bender and Prof. Robert A. Alberty), fifth edition, *review* by Dr. E. F. G. Herington, 209
  Light-Scattering in (Dr. K. A. Stacey), *review* by Dr. G. Allen, 5
Physical Chemistry for Students of Pharmacy and Biology (Dr. S. C. Wallwork), *review* by G. Fowles, 1269
Physical Oceanography, *review* by Dr. G. E. R. Deacon, 1007
Physical Organic Chemistry (Prof. Jack Hine), *review* by Prof. J. R. Partington, 159
Physical Problems of Colour Television. International Symposium on the (Joint publication by *Optica Acta* and *Acta Electronica* of the Proceedings of the), 953
Physical Properties of Deoxyribonucleic Acid: Molecular Weights and (Prof. J. A. V. Butler, D. J. R. Laurence, A. B. Robins and Dr. K. V. Shooter, 1340
Physical Properties of Polymers (Plastics and Polymer Group of the Society of Chemical Industry Symposium on), 467
Physical Sciences: Ordinary Non-Linear Differential Equations in Engineering and (Prof. N. W. McLachlan), second edition, *review* by Dr. L. S. Goddard, 58
Physical Society: Election of Officers for 1957-58, 122, 273
  Report for 1956, 272
  Presidential Address (Prof. N. F. Mott), 272
  Conference on Materials for Nuclear Engineering, 468
  Presentation of the eighth Charles Chree Medal and Prize to Dr. D. F. Martyn, 531
  Conference on Plasma and Atomic Physics, 531
  Recombination of Sections A and B of the *Proceedings*, 635
  Conference on the Band Theory of Metals and the Structure of the Fermi Surface, 893, 1172
Physical Society, in collaboration with British Thomson-Houston, Ltd.: Spring (1956) Meeting (Semiconductors), 25
Physical Society (Acoustics Group), and the North-Eastern Branch of the Institute of Physics: Discussion on Flow Noise, 893
Physical Society (Low Temperature Group) and the Institution of Chemical Engineers: Conference on Recent Developments in Industrial Low Temperature Gas Separation, 270, 1028
Physical Techniques in Biological Research (edited by Gerald Oster and Arthur W. Pollister), Vol. 1, Optical Techniques; Vol. 2, Physical Chemical Techniques; Vol. 3, Cells and Tissues, *review* by Prof. J. A. V. Butler, 1009
Physicians of London, Royal College of: Movement of the Heart and Blood in Animals (William Harvey), translated from the original Latin by Prof. Kenneth J. Franklin, *review* by Prof. F. J. Cole, 449
Physicians of Philadelphia, College of: Alvarenga Prize for 1957 awarded to Prof. W. C. Stadie, 270
Physics: Cloud (Royal Meteorological Society Discussion on), 573
  High Energy Nuclear—Proceedings of the Sixth Annual Rochester Conference, 1956 (compiled and edited by J. Ballam, V. L. Fitch, T. Fulton, K. Huang, R. R. Rau and S. B. Treiman), *review* by Sir John Cockcroft, 303
  The New, *review* by Prof. M. H. L. Pryce, 156
  Post-doctorate Fellowship in (Dalhousie University), 1325
  Secular Changes of the Units and Constants of (A. H. Cook), 1194
  Semiconductor, *review* by Prof. R. E. Burgess, 1265
  Semiconductor Surface—Proceedings of the Conference on the Physics of Semiconductor Surfaces, Philadelphia, 1956 (edited by R. H. Kingston, with the assistance of E. Burstein, A. L. McWhorter, P. H. Miller, Jr., D. T. Stevenson and P. B. Weisz), *review* by Dr. J. R. Tillman, 675
  Soil (Dr. L. D. Baver), third edition, *review*, 774
  Solid State (edited by Frederick Seitz and David Turnbull), Vol. 2 and Vol. 3, *review* by Dr. R. O. Davies, 770
Physics, Institute of: Thirty-seventh Annual Report (1956), 490
  Conference on Nuclear Fuel Cycles, 1239
Physics, Institute of (Electronics Group): Conferences on Transistors, 1329
Physics, Institute of (London and Home Counties Branch): Symposium on the Design of Physics Research Laboratories, 838
Physics, Institute of (North-Eastern Branch), (Acoustics Group of the Physical Society and the): Discussion on Flow Noise, 893
Physics, Annals of, Nos. 1, 2 and 3, 635
Physics taught in American Schools and Colleges (American Institute of Physics, in collaboration with the American Association of Physics Teachers, the American Physical Society, the Fund for the Advancement of Education, and the National Science Foundation, Programme to improve the quality of), 1452
Physics of Elementary Particles (Unesco, the Argentine Atomic Energy Commission, the University of Buenos Aires and the University of La Plata Symposium on), 412
Physics of Flow through Porous Media (Dr. Adrian E. Scheidegger), *review* by Dr. Paul Eisenklam, 1008
Physics of the Solid State, *review* by Dr. R. O. Davies, 770
Physics and Applied Mathematics (Recent Advances in Science), (edited by Prof. Morris H. Shamos and Prof. George M. Murphy), *review* by G. R. Noakes, 206
Physics and Chemistry of Metals (Prof. N. F. Mott), 272
Physics and Electronics: The International Dictionary of, *review* by Dr. J. R. Tillman, 55
  Terminology in, *review* by Dr. J. R. Tillman, 55
Physics (Atmospheric and Terrestrial), Journal of: Special Supplement No. 3, Vistas in Astronomy (edited by Dr. Arthur Beer), *review* by Prof. André Danjon, 1308
Physics (Atomic): Plasma and (Physical Society Conference on), 531
Physics (Electrical Applied): Introduction to (Prof. N. F. Astbury), *review* by H. Kayser, 875
Physics (High Polymer): Recent Advances in (Dr. A. S. Lodge), 75
Physics (Low-Temperature): Keeping Up with, *review* by Dr. R. G. Chambers, 107
  Progress in (edited by Prof. C. J. Gorter), Vol. 2, *review* by Dr. R. G. Chambers, 107
Physics (Low-Temperature), in the U.S.S.R. (Dr. K. Mendelssohn), 460, *erratum*, 893
Physics (Modern): An Approach to (Prof. E. N. da C. Andrade), *review* by Prof. M. H. L. Pryce, 156
Physics (Nuclear), at Oxford, 464
  Advances in, *review* by Dr. T. G. Pickavance, 2
  Progress in (edited by Prof. O. R. Frisch), Vol. 5, *review* by Dr. T. G. Pickavance, 2
Physics (Nuclear), and Engineering: Russian—English Glossary of (Consultants Bureau, Inc.), *review* by J. B. Sykes, 569
Physics (Pure and Applied), International Union of: Ninth General Assembly, 1324
  Election of the Executive Committee for 1957-60, 1324
Physics (Theoretical Atomic), Nordic Institute for: Establishment of the, 1322
Physics Research Laboratories: The Design of (London and Home Counties Branch of the Institute of Physics Symposium on), 838
Physiological Effect of Triethanolamine on the Development of *Sclerotium rolfsii* (Sacc.), (S. Lavee), 1494
Physiological Expedition to the Antarctic (Dr. L. G. C. E. Pugh), 683
Physiological Properties: Kopsine and Strychnine—a Comparative Study of their (Dr. S. R. Mukherjee, Ajit Maiti and P. K. Dey), 916
Physiology: Electrolyte (British Association for the Advancement of Science, Section I (Physiology and Biochemistry), Discussion on), 1017
  Tree (Symposium sponsored by the Maria Moors Cabot Foundation), 77
Physiology of Invertebrates, *review* by Prof. V. B. Wigglesworth, 1309
Physiology of the Large Intestine: A Difference in the, between European and Indigenous Cattle in the Tropics (Dr. J. Quarterman, G. D. Phillips and G. H. Lampkin), 552
Physiology of Nerve Cells (Prof. John Carew Eccles), *review* by Prof. Ragnar Granit, 724
Physiology of Vision: Retinal Chemistry and the (Prof. G. Wald), 1395
Physiology (Human), and Pharmacology at Adelaide, 685
Physiology (Invertebrate): Recent Advances in—a Symposium sponsored by the National Science Foundation, the Tektronix Foundation and the University of Oregon (edited by Bradley T. Scheer), *review* by Prof. V. B. Wigglesworth, 1309

Physiopathology of the Reticulo-Endothelial System—a Symposium organized by the Council for International Organizations of Medical Sciences (edited under the direction of B. N. Halpern by B. Benacerraf and J. F. Delafresnaye), *review* by Prof. T. Nicol and D. L. J. Bilbey, 1155
Phytopharmacy : Report of the eighth Annual Symposium on, 584
Phytophthora : A Die-back of Cacao Seedlings in Nigeria caused by a Species of (S. R. Chant), 1494
Phytophthora erythroseptica . Germination of Oospores of (Dr. Mary Gregg), 150
Phytoplankton (Marine) : Variability in Retention of, by Membrane Filters (Dr. Rueben Lasker and Robert W. Holmes), 1295
Piccciotto, E., and others : Localization of Radioactive and Stable Heavy Nuclides in Ocean Sediments, 85
Pichi-Sermolli, R. : Systematics of To-day (The Higher Taxa of the Pteridophyta and their Classification), 740
Pichotka, Prof. : Bioclimatology and Biometeorology (Problem of Adaptation to Environment), 1328
Pick, Dr. E. P. : Given the Schmiedeberg Award of the German Pharmacological Society, 890 ; work of, 890
Pickard, D. H. : Quality Control of Food (Views of a Market Research Worker on Quality), 1327
Pickavance, Dr. T. G. : Advances in Nuclear Physics, *review*, 2
Appointed first director of the Rutherford High Energy Laboratory of the National Institute for Research in Nuclear Science, 1391 ; work of, 1391
Pickford, Prof. R. W. : Colour Vision of Achromats' Parents, 926
Pickles, Dr. V. R. : A Plain-muscle Stimulant in the Menstruum, 1198
Pidgeon, Prof. L. M. : Our Debt to the Future (Our Economic Potential in the Light of Science), 260
Pierce, Sir Beresford : The Forest Work of the Food and Agriculture Organization of the United Nations, 363
Pierce, J. A., and others : Comparison of Caesium Resonators by Transatlantic Radio Transmission, 526
Piéron, H., et autres . l'Instinct dans le Comportement des Animaux et de l'Homme, *review* by Dr. P. T. Haskell, 518
Piezo-Optic Coefficient (Adiabatic), of Heavy Water (Dr. C. K. Narayanaswamy, P. S. Narayanan and Prof. R. S. Krishnan), 497 ; *erratum*, 953
Piglet : Alloxan Diabetes in the (Dr. L. E. Mount), 344
Piglets : Development of Chemical Thermoregulation in (Dr. A. Holub, Z. Forman and D. Jezková), 858
Pigment (Bile) : Sodium Salt of the Directly Reacting (Dr. Ed. Talafant), 1051
Pigment (Fluorescent), produced in *Microsporum*-infected Hair : Chemical Nature of the (Prof. Frederick T. Wolf), 860
Pigment (Visual), of a Decapod Crustacean—the Lobster (Prof. George Wald and Dr. Ruth Hubbard), 278
Pigments : The Visual (Dr. H. J. A. Dartnall), *review* by Dr. Ruth Hubbard, 1258
Pigments and Pterins in the Skin of the Green Mamba, *Dendroaspis viridis* (J. A. Blair), 1371
Pigments (Natural) : Spectroscopy of the (Photoelectric Spectrometry Group and the Photobiology Group Joint Meeting on), 363
Pigments (Visual), and Depths of Habitat of Marine Fishes (Prof. George Wald, Paul K. Brown and Patricia Smith Brown), 969
Pigs (Fossil), of Florisbad, 1393
Pikovski, M., and others : Serological Changes Concomitant with the Growth of Mouse Tumours in Pretreated Rats, 185
Pileri, A., and others : Relation between Ribonuclease Activity and Ribonucleic Acid Content, 1048
Pilocarpine in Pancreatic Research . Use of (Dr. Winfield S. Morgan), 987
Pine (Southern) : Acceleration of Life-cycle of (Earhart Plant Laboratory of the California Institute of Technology), 892
Pink Shrimps and Red Prawns, 892
Pippard, Dr. A. B. : Low-Temperature Physics (Fermi Surface in Copper), 461
Pirenne, M. H., and others: Individual Differencies in Night-Vision Efficiency, 228
Pirie, N. W. : The Origins of Life—Moscow Symposium, 886
Pisano, John J., and others : Biosynthesis of γ-Guanidinobutyric Acid from γ-Aminobutyric Acid and Arginine, 1125
Pisum : Intracellular Incorporation of Iron-59 into the Root Cells of (J. V. Possingham and R. Brown), 653
Pitaevsky, L. P. (Gorkov, L. P., and) : Low-Temperature Physics (Scattering of Light in Helium-3—Helium-4 Solutions), 461
Pitaevsky, L. P. (Lifshitz, E. M., and) : Low-Temperature Physics (Scatter of Rotons on the Vortex Lines in Rotating Helium), 461
Pitkethly, Dr. R. C. : Vapour Detectors for Gas Chromatography (The Low-pressure Electric Discharge), 23
Pitt, G. A. J. (Morton, R. A., and) : Visual Problems of Colour (Visual Pigments), 1395
Pitt, G. J. : At the Second International Conference on Coal Science (Extracting, with Chloroform, Fusible Material developed by Coking Coals on Heating), 419
Pitts, W., and others : Membrane Currents in Clamped Vertebrate Nerve, 1290
Pituitary of *Ophicephalus punctatus* and *Barbus stigma* : Parasitism in relation to the (A. G. Sathyanesan), 98
Pituitary of the Parrot Fish, *Pseudoscarus guacamaia* : Occurrence of Periodic Acid—Schiff Positive Material in the (Dr. A. J. Matty), 1055
Pituitary Gland (Rabbit) : Fixation of the (M. Allanson, Dr. C. L. Foster and G. Menzies), 766
Pituitary Grafts : Resumption of Gonadotrophic Function in, following Retransplantation from Kidney to Median Eminence (M. Nikitovitch-Winer and J. W. Everett), 1434
Place, Dr. I. C. M. : Appointed officer-in-charge of the Petawawa Forest Experiment Station of the Canadian Department of Northern Affairs and National Resources, 270
Place-Name Elements : English (A. H. Smith), Part 1, Introduction Bibliography, the Elements A-IW, Maps ; Part 2, The Elements Jafn-Ytri, Index and Maps, *review* by Prof. H. C. Darby, 106
Places : Times and (the late Harold Peake and Prof. Herbert John Fleure), *review* by M. C. Burkitt, 159
Plackett, R. L. (Hewlett, P. S., and) : Quantal Responses to Mixtures of Drugs, 712
Plague : Lethality for Guinea Pigs of Ultrasonic Extracts of *Pasteurella pestis*—its Relationship to Death of Guinea Pigs from (J. Keppie, H. Smith and E. C. Cocking), 1136
Plain-muscle Stimulant in the Menstruum (Dr. W. R. Pickles), 1198
Plack, Audrey : Sexual Dimorphism in Labiatae, 1218
Planet Jupiter : Sources of Radio Noise on the (C. H. Barrow, T. D. Carr and Prof. A. G. Smith), 381
Planetary Atmospheres and Convection in Rotating Fluids (Royal Meteorological Society and the Royal Astronomical Society Joint Symposium on), 1455
Planets : Radio Noise from (F. Horner), 1253
Planning of Science (World Federation of Scientific Workers Symposium on), 583
Plant (Dairy) Laboratory Control of (Dr. J. G. Davis), *review* by Dr. L. F. L. Clegg, 207
Plant (Glasshouse Tomato) : Boron in the (B. Wilkinson), 666
Plant (Haploid), of the Potato Variety Katahdin (Dr. R. W. Hougas and Dr. S. J. Peloquin), 1209
Plant Breeders' Rights (Committee on Transactions in Seeds Inquiry into), 893
Plant Cell : Ion Permeability of the Plasmalemma of the (N. A. Walker), 94 ; (Prof. G. E. Briggs), 1142
Plant Cells : An Effect of pH on the Uptake of Salt by (R. G. Hurd and Dr. J. F. Sutcliffe), 233
Lethal Effects on, of Fungal and Bacterial Extracts (S. G. Fushtey), 20
Plant Control : Dairy, *review* by Dr. L. F. L. Clegg, 207
Plant Diseases and Human Welfare, *review* by F. C. Bawden, 1260
Plant-Growth Substances : Control of Flowering in Rice by (Dr. G. Misra and G. Sahu), 816
Plant Pathology : Principles of (Prof. E. C. Stakman and J. George Harrar), *review* by F. C. Bawden, 1260
Plant Remains (Ancient) : Difference in the Behaviour of Tissues in, and during Chemical Treatment (K. A. Chowdhury, S. S. Ghosh, R. V. Bhat and G. M. Vyas), 612
Plant Species of Drier Habitats : An Inherent Character of (Dr. M. L. R. Pettersson, S. K. F. Ellis, G. E. J. Gray and R. S. Smith), 698
Plant Tissues : Separation and Identification of Aromatic Acids in, by Paper Chromatography (Dr. L. A. Griffiths), 286
Utilization of 4-Amino 5-Imidazole Carboxamide in (Prof. K. V. Giri and P. R. Krishnaswamy), 1427
Plants : Defence Mechanism of, against Fungi—Fungistatic Properties of Apple Leaf Wax (Dr. J. T. Martin, R. F. Batt and R. T. Burchill), 796 ; Solubilization of Copper by Leaves and Water-soluble Acids from Leaf Wax (Dr. J. T. Martin and E. Somers), 797 ; Sorption of Copper from Burgundy Mixture by Leaves (E. Somers and D. V. Richmond), 798
Rate of Entry of Radioactive Strontium into, from Soil (Dr. R. Scott Russell and G. M. Milbourn), 322
Some Aspects of Micronutrient Element Metabolism in (Dr. E. J. Hewitt), 1020
A Technique for the Measurement of Lead Tolerance in (D. A. Wilkins), 37
Radiosensitivity of Salt Uptake in (D. A. Barber, Dr. G. J. Neary and Dr. R. Scott Russell), 556
Plants (Crop) : Rapid Estimation of the Areas of the Leaves of (Dr. P. C. Owen), 611
Plants (Flowering) : Expression of Sex in (Prof. H. G. Baker), 614
Plants (Green), of a Winter Wheat : Vernalization of (Dr. M. B. Gott), 714
Plants (Pea) : Homoserine in Bleeding Sap of (Dr. Janny A. Bakhuis), 713
Plants, Animals and Man : Polymorphism in (Dr. E. B. Ford), 1315
Plants and Animals (Soils,) Trace Elements in (Agriculture Group and the Bristol Section of the Society of Chemical Industry Symposium on), 23
Plasma Phenols as Inhibitors of the Heparin Co-factor of (Dr. P. Fantl and A. G. M. Marr), 990
Plasma (Platelet-rich) : Evidence for the Formation of a Labile Phospholipoprotein during the Clotting of (Dr. G. V. R. Born), 546
Plasma Pain-producing Substance and Blood Clotting (J. Margolis), 1464
Plasma and Atomic Physics (Physical Society Conference on), 531
Plasma and Cells : Vitamin B_{12} Distribution between (Herman Baker, Inez Pasher, Dr. Harry Sobotka, S. H. Hutner, Sheldon Aaronson and Herman Ziffer), 1043
Plasmalemma of the Plant Cell : Ion Permeability of the (N. A. Walker), 94 ; (Prof. G. E. Briggs), 1142
Plastic Mounts for Biological Display (Dr. Blodwen Lloyd), 737
Plastic Sheet (Transparent) : Detection of Inhomogeneities in, by a simple Schlieren Technique (H. H. Allen), 50
Plastics : The Chemistry of (Symposium at the Bradford Institute of Technology), 1454
The Progress of (Prof. C. E. H. Bawn), 1098
Plastics Institute . Fourth Lecture for Young People (Prof. C. E. H. Bawn), 1098
Platelet-rich Plasma : Evidence for the Formation of a Labile Phospholipoprotein during the Clotting of (Dr. G. V. R. Born), 546
Plates (Flat) : Attractive Forces between (Dr. M. J. Sparnaay), 334
Plates (Perforated) : Aerodynamic Drag of (J. R. D. Francis and P. Minton), 702
Platt, Dr. B. S. : Flour and Bread, 319
Platt, Dr. R. B. : Bioclimatology and Biometeorology (Microclimate and its Effects on Life), 1328
Pleasure : Pain and—a Study of Bodily Feelings (Prof. Thomas S. Szasz), *review* by Dr. Clifford Allen, 936
Pleistocene Geology, *review* by Prof. W. B. R. King, 1261
Glacial and (Prof. Richard Foster Flint), *review* by Prof. W. B. R. King, 1261
Pleistocene Period in Morocco : Correlation between the Marine and Continental Cycles of the (Georges Choubert), 1171
Plesch, Dr. R. H. : Solvent Effects and Reaction Mechanism, 535
Pleuropneumonia-like Organisms : Contamination of Stock Lines of Human Carcinoma Cells by (Dr. L. H. Collier), 757
Plumbochloride (Caesium) : A Phase Transition in (Chr. Kn. Møller), 981
Plummer, Albert J., and others : Antihypertensive Activity of Hexahydro-1-Azepinepropionamidoxime, 1200
PLUTO—Materials Testing Reactor at Harwell, 952
Construction of, 952

Plutonium : Absence of Lethal Radiation Effects following Massive Oral Administration of (Maurice F. Sullivan and Dr. Roy C. Thompson), 651

Pneumoconiosis Field Research : The National Coal Board's (Dr. J. W. J. Fay), 309

Pochon, Dr. J. : Methods of Studying the Microbiology of Soils (Methods of Counting Soil Bacteria), 591

Poddar, R. K., and Chatterjee, Dr. K. R. : Autoradiographic Detection of Sulphone in the Affected Tissues of Leprosy Patients, 854

Poetry : Thought, Life and Time as reflected in Science and (Dr. H. C. Wood), *review* by F I G. Rawlins, 676

Point of Attack in Hydrocarbon Oxidation (R. Burt, F. B. Ebeid and Dr. G. J. Minkoff), 188

Point Defects in Metals and Alloys : Vacancies and other (Metals Physics Committee of the Institute of Metals Symposium on), 893

Poison : An Acetylcholine-like Salivary, in the Marine Gastropod *Neptunea antiqua* (Dr. Ragnar Fange), 196

Polanyi, Prof. M. : University Apartheid in South Africa, 1163

Polarization of Comet Arend-Roland (Dr. M K. Vainu Bappu and Dr. S. D. Sinvhal), 1410

Polarization of Solar Radio Outbursts (Kenji Akabane and Takeo Hatanaka), 1062

Polarization (Longitudinal), of the Positrons from the Decay of Unpolarized Positive Muons (G. Culligan, S. G. F. Frank, J. R. Holt, J. C. Kluyver and T Massam), 751

Polarized Radio Emission from the Galaxy . An Attempt to detect Linearly (J. M. Thomson), 495

Polarizer . The Compound (Prof. M. A. MacConaill), 603

Polarographic Half-Wave Potential of some Polynuclear Hydrocarbons · *Para*-Localization Energy (Free-Electron Molecular-Orbital) and (Dr. Sadhan Basu and Rama Bhattacharya), 143

Polarographic Half-Wave Potentials of Aromatic Nitro Compounds : Group Localization Energy and (Dr Sadhan Basu and Jayanti Nag Chaudhuri), 1473

Polarographic Wave Analysis (Dr. D. C. Munro), 540

Poliomyelitis Virus : Changes in Cellular Nucleic Acids during Infection with, as studied by Fluorescence Microscopy (Dr. Esther Tenenbaum), 1044

Political and Economic Planning : Broadsheet No. 410, Transatlantic Travel, 19
  Broadsheet No 411, Trade Fairs and Exhibitions, 361
  Three Case Studies in Automation, 669
  Report on Graduates in Industry, 871
  Broadsheet No 414, Designs for Europe, 965

Politics in Tribal Societies : Government and (Prof. I Schapera), *review* by Dr A L. Epstein, 1442

Poljakoff-Mayber, A. (Mayer, Dr. A. M , and) : Tactic Movements in *Chlamydomonas moewusii*, 927

Pollak, M. · The Abyssal Circulation of the Ocean, 734

Pollen, Daniel A., and others : Search for a Potassium Compartment in the Human Red Cell Membrane, 993

Pollen in Terrestrial Soils (G. W. Dimbleby), 229

Pollen Grains and Small Fossil Remains from Fibrous Peats and Moss Polsters . A Method for Concentrating (D M. Churchill), 1437

Pollister, Arthur W. (edited by Oster, Gerald, and) · Physical Techniques in Biological Research, Vol. 1, Optical Techniques ; Vol. 2, Physical Chemical Techniques ; Vol. 3, Cells and Tissues, *review* by Prof. J. A V Butler, 1009

Pollution · Air and Water—the Position in Europe and in the United States (European Productivity Agency of the Organization for European Economic Co-operation, Project Nos. 136 and 145), *review* by Dr. A. Parker, 451

Pollution (Air) : The Primary Sources of (Dr. R. Lessing), 637

Pollution (Air), and the Weather (Sir Graham Sutton), 637

Pollution (Water), in the Iron and Steel Industry (Iron and Steel Engineers Group Discussion on), 893

Polonium-210 α-Particles : Luminescence produced in Air by (Prof. R. W. Nicholls and E M. Reeves), 1188

Polsters (Moss) : A Method for Concentrating Pollen Grains and Small Fossil Remains from Fibrous Peats and (D. M. Churchill), 1437

Polya, Prof. J. B. : High Polymer, Colloid and Surface Chemistry (Interaction of Whole Serum with Water-soluble Amides and Triazoles), 961

Polyacene Solid Solutions : Energy Transfer in (F. R. Lipsett), 786

Polycyclic Peptides : An Approach to the Synthesis of (Dr. Dorothy Wrinch), 502

Polyelectrolyte Molecules (Chain-like) : Influence of Ion Exchange on Size and Shape of (R. E. Cooper and Dr. A Wassermann), 1072

Polyesters and their Applications (Bjorksten Research Laboratories, Inc.), *review* by E. W. Russell, 774

Polyethylene : Large Periods in—the Origin of Low-Angle X-Ray Scattering (A. Keller and A. O'Connor), 1289

Polyethylene Terephthalate · Molecular Weight Determination in (I. M. Ward), 141

Polyhedral Shape of Adenovirus Particles as shown by Electron Microscopy (Dr. R. C. Valentine and Dr. P. K. Hopper), 928

Polyhedral Virus of *Heliothis armigera* (Hbn.) (Lepidoptera : Noctuidae), (Dr. G. H. Bergold and Dr W. E. Ripper), 764 : (Dr. Kenneth M. Smith and C. F Rivers), 928

Polyhedral Virus of *Prodenia litura* (Fabr.) (Lepidoptera : Noctuidae), (Dr. G. H. Bergold and Dr. B Flaschentrager), 1046

Polymer Chemistry : Textbook of (Fred. W. Billmeyer, Jr.), *review* by Prof. C. E. H. Bawn, 672

Polymer Corporation of Sarnia, Canada : Research Studentship founded at the University College of North Staffordshire elevated to a postdoctoral Research Fellowship, 688

Polymer Films : Photochemistry of (Dr. G. S. Egerton and A. G. Roach), 189

Polymer Molecules : Making and Breaking (British Association for the Advancement of Science, Section B (Chemistry), Discussion on), 899

Polymer Processes—Chemical Technology of Plastics, Resins, Rubbers, Adhesives and Fibres (edited by Calvin E Schildknecht), *review* by Prof. C. E. H. Bawn, 672

Polymer (High) Degradation Processes : Chemistry of (Dr. Norman Grassie), *review* by Prof. C. E. H. Bawn, 672

Polymer (High) Forum : Eighth Canadian (National Research Council of Canada and the Chemical Institute of Canada), 838

Polymer (High) Physics : Recent Advances in (Dr. A. S Lodge), 75

Polymer (High), Colloid and Surface Chemistry (South Australian Branch of the Royal Australian Chemical Institute Discussion on), 959

Polymerization Reactions : A Dilatometric Method of Following the Non-stationary State of (Dr. W. I Bengough), 1120

Polymers : High, *review* by Prof. C. E. H. Bawn, 672
  Physical Properties of (Plastics and Polymer Group of the Society of Chemical Industry Symposium on), 467

Polymers (High) . International Conference on, at the University of Nottingham, 467

Polymorphism : Selectively Balanced, at a Sex-linked Locus (Prof. J. H. Bennett), 1363

Polymorphism in Human Trypanosomiasis (Dr. D J B. Wijers), 391

Polymorphism in Plants, Animals and Man (Dr. E. B. Ford), 1315

Polymorphism (Chromosome), in the Common Shrew (Dr. C. E. Ford, J. L. Hamerton and G. B Sharman), 392

Polynuclear Hydrocarbons : *Para*-Localization Energy (Free-Electron Molecular-Orbital) and Polarographic Half-Wave Potential of some (Sadhan Basu and Rama Bhattacharya), 143

Polynuclears (Dog's Lymphocytes and) : Cholinesterase Content of the (Dr. A J. Philippu), 438

Polynucleotide Phosphorylase : Activation of, by Salts (Roland F. Beers, jun.), 246

Polypeptide and Protein Films : Optical Rotation and Infra-Red Spectra of some (Dr. A. Elliott, W. E. Hanby and B. R. Malcolm), 1340

Polypeptides : Liquid-Crystalline Structures in (Dr. Conmar Robinson and J. C. Ward), 1183

Polyphenoloxidase (Tyrosinase) : State of Copper in (Prof. Denis Kertész), 506

Polypropylene : Effect of High-Energy Radiation on (Dr. R. M. Black and Dr. B. J. Lyons), 1346

Polyps (Coral) : Co-ordinated Response to Stimuli in (Dr. N. B. Eales), 421
  Co-ordination of the Protective Retraction of (Dr G. A Horridge), 421

Polysaccharides (Type-Specific), containing Aldoheptose Sugars : *Pasteurella septica*—the Occurrence of (A. P. MacLennan and C. J. M. Rondle), 1045

Polystoma integerrimum : Anatomy of (Joan B Williams), 866

Polytene Chromosomes of *Rhynchosciara angelae* : Autoradiography of, at Different Stages of Larval Development (A. Ficq and C. Pavan), 983

Pomey, G., and Gueussier, A : Presented with Rist Prizes of the Société Française de Métallurgie, 219

Pomfret, H. : Awarded the Service Medal of the Textile Institute, 1028

Pond Creatures : Seven (Edna Johnson), *review*, 676

Pond Weed and Fish · Distribution of Strontium-90 in (K. W. E. Bidwell and Eileen E. Foreman), 1195

Ponder, Dr. Eric, and Ponder, Ruth V : Quantity of Radioactive Lecithin and Radioactive Cephalin with Lipositol required to produce Sphering of Mammalian Red Cells, 814

Ponder, Ruth V. (Ponder, Dr. Eric and) : Quantity of Radioactive Lecithin and Radioactive Cephalin with Lipositol required to produce Sphering of Mammalian Red Cells, 814

Ponte, Dr. : Quartz Oscillators and their Limitations, 1178

Pool, R. A. H : Granted the renewal of a British Oxygen Fellowship for Postgraduate Research, 270

Pool, R. A H., and Staveley, L. A. K. : Excess Volumes in Binary Liquid Mixtures of Simple Molecules, 1118

Pope, C. A. : The Defence Research Board, Canada, 782

Pope, Joseph H. : Diurnal Variation in the Occurrence of 'Dawn Chorus', 433

Popjak, Dr. G. J. · Biogenesis of Natural Products (Biochemical Causes of Atherosclerosis—the Mechanisms of the Biosynthesis of Cholesterol), 680

Pople, Dr. J. A : Given an award under the Royal Society and Nuffield Foundation Commonwealth Bursaries Scheme, 119

Popov, Dr Catherine : The Repetitive Property of the Human Brain as studied by the Electroencephalograph and the Method of After-Images, 328

Popper, Prof. Karl R. : The Poverty of Historicism, *review* by Dr. C. K. Grant, 1255

Popularizing the International Geophysical Year, *review* by Dr. M. A. Ellison, 623

Population (Normal) : Algebraic Transformations to a, 219

Population Study of Penguins (L. E. Richdale), *review* by Dr. L. Harrison Matthews, 3

Populations (Laboratory), of *Drosophila* : a New Technique for the Study of (J. A. Thomson), 1495

Porath, J. : Protein Structure and Biological Activity, 835

Pores : Permeability and the Size Distribution of (Dr. T J Marshall), 664

Porous Bodies (Thick) : Mechanism of Drying of, during the Falling-Rate Period (Prof. A H. Nissan and W. G. Kaye), 142

Porous Brittle Materials : Strength of Highly (K. Schiller), 862

Porous Media : The Physics of Flow through (Dr. Adrian E. Scheidegger), *review* by Dr. Paul Eisenklam, 1008

Porphyria (Congenital), in Bovines—First Living Cases in Britain (Prof. E. C. Amoroso, R. M Loosmore, Prof. C. Rimington and B E. Tooth), 230

Porter, G., and others : Use of Wooden Boxes for Breeding Mice, 251

Porter, Prof. G., and Windsor, M W. : Observation of Short-lived Free Radicals in Solution, 187

Porter, Dr Helen K. : Promoted to Senior Principal Scientific Officer by the Agricultural Research Council, 639 ; work of, 639

Porter, Muriel : Excavations at Chupicuaro, Guanajuato, Mexico, 636

Porter, Dr. M. W., and Spiller, R. C. : The Barker Index of Crystals, Vol. 2, Crystals of the Monoclinic System, Parts 1, 2 and 3, *review* by Dr. F. C. Phillips, 821

Porter, R. R. : Protein Structure and Biological Activity, 834

Porterfield, Dr. J. S. : Use of Goose Cells in Haemagglutination Tests with Arthropod-borne Viruses, 1201

Portway, Donald : Appointed to the chair of mechanical engineering in the University of Khartoum, 585

Positive Muons (Unpolarized) : Longitudinal Polarization of the Positrons from the Decay of (G. Culligan, S. G. F. Frank, J. R. Holt, J. C. Kluyver and T. Massam), 751

Positrons from the Decay of Unpolarized Positive Muons : Longitudinal Polarization of the (G. Culligan, S. G. F. Frank, J. R. Holt, J. C. Kluyver and T. Massam), 751

Possibilities in Peptide and Protein Chemistry : Thiols, Disulphides an Thiosulphates—some New Reactions and (Dr. J. M. Swan), 643
Possible Auroral Enhancement of Infra-red Radiation emitted by Atmospheric Ozone (Wallace B. Murcray), 139
Possible Occurrence of Strains in Species of Schistosomes (B. Verdcourt), 865
Possingham, J. V. : Molybdenum Nutrition and Free Amino-Acids in Tomato, 363
Possingham, J. V., and Brown, R. : Intracellular Incorporation of Iron-59 into the Root Cells of *Pisum*, 653
Post, R. F : Ionization Phenomena in Gases (Problems of Research into Controlled Fusion), 793
Post-chromatographic Enzymatic Technique : Detection of the Substrate of Enzymic Browning in Cacao by a (Dr. L. A. Griffiths), 1373
Post-doctorate Fellowship in Physics (Dalhousie University), 1325
Post-irradiation Administration of Methionine : Influence of, on the Levels of Deoxyribonucleic Acid in Bone Marrow, Spleen and Liver of Rats (M. K. Nerurkar, A. J. Baxi, N. S. Ranadive, M. V. Nerurkar and M. B. Sahasrabudhe), 193
Post Office Research Station . Open Day, 1240
Postel, Dr. W. : Vegetable Quality (Effect of Manuring on the Essential Amino-Acid Composition of Potatoes), 174
Postgraduate Research : British Oxygen Fellowships for (Awards), 270
Potassium-40 : Biological Role of (A. V. Vinogradov), 507
Potassium-42 : Demonstration of Early Renal Uptake of, by an Autoradiographic Method for Water-soluble Isotopes of Short Half-life (Dr. V. D. Essen and Dr F. T. C. Harris), 440
Potassium-42 and Rubidium-86 : Transport of, by Kidney Cortex Slices—the Effect of varied Concentration Gradients (A. Kleinzeller and Dr. J. H. Cort), 1124
Potassium Compartment in the Human Red Cell Membrane : Search for a (A. K. Solomon, June Loucks, Daniel A. Pollen, Thomas J. Gill, 3rd., and Elizabeth Wolf), 993
Potassium and Calcium Ions (Sodium,), in the Haemolymph of *Oncopeltus fasciatus* (Dallas), (Prof. James A. Mullen), 813
Potassium and Water in the Rat : Effect of Angiotonin on the Distribution of Sodium, (Prof Sydney M. Friedman, Constance L. Friedman and Miyoshi Nakashima), 194
Potato : Phosphorylase Inhibitor in—Separation from Activator and Possible Relation to Chlorogenic Acid (Dr. Sigmund Schwimmer), 149
Potato Blight and Leaf-Roll Virus (D. E. Richardson and D. A. Doling), 866
Potato Blight Fungus : Infection of Native *Solanum* Species by the (C. M. Driver), 1367
Potato Disks (Aerated) : Respiratory Metabolism of (Nona Calo, Joy Marks and J. E. Varner), 1142
Potato Mashes : Saccharification of, by means of Fungal Preparations (K. Baran, M Burger and S. Zalenka), 362
Potato Root Eelworm, *Heterodera rostochiensis* Woll. : Chromosomes of the (Dr. Ralph Riley and Victor Chapman), 662
    Development of Isolated Female Larvae of the (T. D. Williams), 1000
Potato-Root Eelworm Hatching Factor : Cardiotonic Activity of the (Dr. C. Ellenby and A B Gilbert), 1105
Potato Starch : Micelle Dimension of (Susumu Hizukuri and Ziro Nikuni), 436
Potato Variety Katahdin : A Haploid Plant of the (Dr. R. W. Hougas and Dr S. J. Peloquin), 1209
Potential (Morse) : Classical Motion under a (N. B. Slater), 1352
Potential (Polarographic Half-Wave), of some Polynuclear Hydrocarbons : *Para*-Localization Energy (Free-Electron Molecular-Orbital) and (Dr. Sadhan Basu and Rama Bhattacharya), 143
Potential Barriers : Detection of Particles inside (Rolf G. Winter), 1471
Potentials (Atrial Cellular) : Effect of Acetylcholine and Quinidine on (Dr. Edward A. Johnson and Dr. P. A. Robertson), 1483
Potentials (Local Electrode) : Study of Strain Distribution in Metals by the Determination of (Prof. Hugh O'Neill and Dr. D. Eurof Davies), 498
Potentials (Polarographic Half-Wave), of Aromatic Nitro Compounds : Group Localization Energy and (Dr. Sadhan Basu and Jayanti Nag Chaudhuri), 1473
Potter, D. D. (Furshpan, Dr E. J., and) : Mechanism of Nerve-Impulse Transmission at a Crayfish Synapse, 342
Potter, E. A. : Variation in the Number of Buttercup Petals, 179
Poulik, Dr. M. D : Starch Gel Electrophoresis in a Discontinuous System of Buffers, 1477
Poults (Turkey) : Lack of Growth-promoting Activity of Inactivated Penicillin with (J. R. Jowsey, F. D. Cook, H. I. MacGregor and R. M. Blakely), 923
Pound, Prof. R. V. (Rebka, jun., G. A., and) : Time-correlated Photons, 1035
Pouradier, Dr J : Recent Advances in Gelatin and Glue Research (Soluble Collagens and Molecular Weight, Shape and Structure of Gelatins), 690
Poverty of Historicism (Prof. Karl R. Popper), *review* by Dr. C. K. Grant, 1255
Powdered Dental Enamel : Fluoride Removal by, from Solutions of Stannous or of Sodium Fluoride (Dr. Frank A. Smith, Dwight E. Gardner, Dr. Samuel E. Leach and Dr. Harold C. Hodge), 1421
Powell, A. R : Modern Analytical Chemistry in Industry (Modern Analytical Chemistry and the Rarer Metals), 368
Powell, Prof. C. F. : Elected president of the World Federation of Scientific Workers, 583
Powell, D. B. (Cornford, C. E., and) : Effect of Gamma Rays on the Sprouting of Stored Mangolds, 996
Powell, E. O. (Darlow, H M., and) : An Effect of Hexylresorcinol on Bacterial Aerosols, 1425
Powell, H. T. : Research in Marine Biology (Taxonomic Study of *Fucus distichus*), 745
Powell, K E. C. : Awarded a Clasp to the Polar Medal, 18
Powell, W B. : Appointed staff fellow in the Department of Physics in the University of Birmingham, 122
Power from Nuclear Fusion (J. D. Lawson), 780
Powles, Dr. J. G., and Cutler, D. : Audiofrequency Nuclear-resonance Echoes, 1344
Poynton, F. Y. (Smith, Dr. C. N., and) : Grant of £2,600 from the Paul Instrument Fund Committee, for continuation of the construction of an ultrasonic microscope, 270
Poynton, Valerie B. : Science in Schools (Round Dublin in the Steps of a Marine Biologist), 731
Practical Organic Chemistry : Elementary (Dr. Arthur I. Vogel), Part I, Small Scale Preparations, *review* by G. Fowles, 569
Practice : Code of, for the Protection of Persons exposed to Ionizing Radiations, 578
Prague : Technical Schools in—250th Anniversary (Prof. J. S. Rankin), 639
Prain, Sir David, 1857-1944 (Dr. George Taylor), 162
Pramer, Prof. David, and others : Respiratory Characteristics of Marine Bacteria, 1489
Prasiola stipitata Suhr. : Occurrence of Motile Gametes in (Dr. Kathleen M. Drew and I Friedmann), 557
Prawns (Red) : Pink Shrimps and, 892
Pre-Famine Ireland, a Study in Historical Geography (T. W. Freeman), *review* by J. P. Haughton, 1440
Precision Determination of Cell Dimensions by the Back-Reflexion Weissenberg Method (F. H. Herbstein), 291
Precursors of Melanin in Mammals : Tyrosine Peptides as (Dr. Kerry Yasunobu), 441
Precursors (Labelled) : Lack of Differential Radiation Effect on the Incorporation of, into Deoxyribonucleic Acid (L. G. Lajtha), 1048
Prediction of Critical Temperatures (D. K. H. Briggs and W. D. Drake), 1353
Prediction of a Meteor Orbital Period (E. G. Bowen), 737
Preferential Ionization of Argon in the Presence of Air and its Application to Electric Discharge Devices (D. P. C. Thackeray), 913
Pregnant Mares : Isolation of Uranediol from the Urine of (W. L. Glen, R. Barber and G. A. Grant), 288
Premaswarup, D., and Barrow, Dr. R. F. : Rotational Analysis of the Tantalum Oxide Bands, 602
Premiums for articles on Electronics (Radio Industry Council), 1325
Preputial Gland (Female Rat) . Purification of β-Glucuronidase from (Dr. G A. Levvy and C. A Marsh), 919
Preservation of the Countryside : Eighteenth National Conference for the (Rural Problems of the Moment), (Council for the Preservation of Rural England), 531
Preservation of Rural England, Council for the : Eighteenth National Conference for the Preservation of the Countryside (Rural Problems of the Moment), 531
    Work of the, 636
Preservation (Timber), by Copper Compounds (D. S. Belford and Prof R. D. Preston, and C. D. Cook and E. H. Nevard), 1081
Pressures in Gaseous Detonation Waves : Effect of Tube Diameter on the (Dr. D. H. Edwards and G. T Williams), 1117
Pressures (High) : Flow of Steam—Water Mixtures at (R W. Haywood), 357
Pressures (Low) : A Significant Error in the Determination at, of the Virial Coefficients of Vapours (Prof. R. Whytlaw-Gray and Dr. G. A. Bottomley), 1252
Preston, J. (Hoare, Dr. F. E., and) : Properties of Palladium—Rhodium Alloys, 334
Preston, Prof. R D., and others : A Lattice Distortion of Alkali Chloride Crystals in the presence of Nucleoprotein Microfibrils, 696
Preston, Prof R. D (Belford, D. S , and), and others : Timber Preservation by Copper Compounds, 1081
Preston, Dr. T R. : Nutrition of the Very Young (The Nutrition of Young Animals), 950
Pretreated Rats : Serological Changes Concomitant with the Growth of Mouse Tumours in (M. Pikovski, C. Tal, M. Schlesinger and E. Margolleath), 185
Prevention of Cruelty to Animals, Royal Society for the : Pamphlet on Cleansing of Oil-polluted Birds, 1453
Prevention of Reversal in Mercury-198 Lamps (K. M. Baird and D. S. Smith), 1476
Prévot, A. R : Biologie des Maladies dues aux Anaérobies, *review* by Prof. R. Knox, 1152
Price, Dr. C. A. . A New Thiol in Legumes, 148
Price, E. M. (Buckingham, Dr. H , and) : Electro-Technology for National Certificate Courses, Vol. 2, *review* by Dr. P. F. Soper, 1309
Priestley, Sir Raymond : Sidelight on a Modern Arctic Expedition, *review*, 1258
Primary School : Science in the (B. L. H. Hampson), 1323
Primary Sex Ratio of Fowl (Prof. Walter Landauer), 1139
Primary Sources of Air Pollution (Dr. R. Lessing), 637
Primates—Comparative Anatomy and Taxonomy (Dr. W. C. Osman Hill), 3, Pithecoidea, Platyrrhini (families Hapalidae and Callimiconidae), *review*, 874
Prime Numbers from 1 to 10,006,721 : List of (Derrick Norman Lehmer), *review* by Dr J C. P. Miller, 520
Primes and Factors, *review* by Dr J. C. P. Miller, 520
Prince, A. : The Constitutional Diagrams of Alloys (originally compiled by Dr. J. L. Haughton), second edition, *review* by A. R. Bailey, 352
Principles of Energetics in Biochemical Reactions : Some (Prof. Irving M. Klotz), *review* by Dr. Herbert Gutfreund, 207
Principles of Geochemical Prospecting (Dr. H. E. Hawkes), 1453
Principles of Plant Pathology (Prof. E. C. Stakman and J. George Harrar), *review* by F. C. Bawden, 1260
Principles of Therapeutics (Prof. J. Harold Burn), *review* by Prof. J. H. Gaddum, 109
Principles (General), governing the Use of Food Additives (World Health Organization Technical Report Series No. 129), 1170
Pringle, Dr. J. W. S. : Structure and Functioning of the Nervous System (The Analysis of Nerve Function), 1389
Pringsheim, Prof. E. G. : Two Species of *Trachelomonas* (Euglenineae) without Chlorophyll, 1296
Prior, D. R. O : Awarded the Polar Medal, 18
Probability (M. T. L. Bizley), *review* by Dr. D. J. Finney, 1270
    Subjective, *review* by R. L. Gregory, 158
Probable Evolutionary Relationship of Serotonin and Indoleacetic Acid, and some Practical Consequences Therefrom (Dr. D. W. Woolley), 630
Problem of the 'Amphioxides' Larva (Quentin Bone), 1462
Problem (Inspection) : Vigilance and the (W. P Colquhoun), 1331
Problem (Language) : Scientific and Technical Translating and other Aspects of the (Unesco Report on), 1170

Problems : The Balance-of-Payments, of a European Free-Trade Area (Prof. J. E. Meade), 481
Problems of Conifer Embryology : Aspects and (Prof. J. Doyle), 485
Problems (Endocrinological), in Agriculture (Dr. I. W. Rowlands), 576
Problems (Human), of Industrial Communities within the Commonwealth and Empire . H.R H. the Duke of Edinburgh's Study Conference on the (Oxford, 1956), *review* by Dr. W. H. Scott, 876
Problems (Some Nutritional and Allied), confronting the Food Manufacturers (Nutrition Panel of the Food Group of the Society of Chemical Industry Meetings on), I, Colours and Flavours, 1242
Problems (Physical), of Colour Television : International Symposium on the (Joint publication by *Optica Acta* and *Acta Electronica* of the Proceedings of the), 953
Problems (Rural), of the Moment (Eighteenth National Conference for the Preservation of the Countryside), (Council for the Preservation of Rural England), 531
Problems (Visual), of Colour (Symposium at the National Physical Laboratory), 1395
Procedure (A Rapid), for the Separation of Amino-Acids on Paper Chromatograms (Henry R. Roberts and Michael G. Kolor), 384
Procedures (Staining) : Morphological Changes of Tubercle Bacilli caused by (Prof. T. Ebina, C. Shinohara, H. Saito, K. Fukushi and J. Suzuki), 42
Process for Crease-fixed Wool, 953
Prodenia litura (Fabr.) (Lepidoptera : Noctuidae) . The Polyhedral Virus of (G. H. Bergold and Dr. B. Flaschentrãger), 1046
Product condensed at Low Temperatures from Dissociated Peroxide Vapour : Nature of the (R. L. Allen and Dr. F. S. Stone), 752
Production of Carbon in the Sea (Dr. J. H. Oliver), 617 ; (D. H. Cushing), 617
Production of Experimental Nephrocalcinosis : Sensitization by Œstradiol to the (Prof. H Selye), 1420
Production of Rat Serum Proteins in Irradiated Mice (W. W. H. Weyzen and O. Vos), 288
Production of Sclerotic Granules by *Streptomyces* sp. (Dr. M. L. Gattani), 1293
Production of Tetanus Toxin : A Semi-continuous Method for the Large-scale (Dr. Robert O. Thomson), 1126
Production of Vibrationally Excited Oxygen Molecules in the Flash Photolysis of Ozone (W. D. McGrath and Prof. R G. W. Norrish), 1272
Production (Electronics) : Mechanical Design for (John M. Carroll), *review* by D. L. Johnston, 1154
Production (Speech), and Language Statistics (Dr. F. Goldman-Eisler), 1497
Production Control (Industrial Applications Section of the Royal Statistical Society Conference on), 1239
Productivity (Biological), of Britain (Institute of Biology Symposium on), 531
Profile (Stratigraphic), of Chalk at Flamborough, Yorkshire : Velocity of Compressional Waves for a (A. S. Laughton and A. H. Stride), 977
Progesterone : Secretion of, by the Adrenal Gland (Dr. W E. Balfour, Dr. R S. Comline and R. V Short), 1490
Progress of Applied Chemistry : Reports on the, Vol. 40, 1955 (edited by H. S. Rooke), *review* by Prof. J R. Partington, 59
Progress of Cancer Research, 1312
Progress in the Commercial Use of Atomic Energy, 1096, 1451
Progress in Low Temperature Physics (edited by Prof. C. J. Gorter), Vol. 2, *review* by Dr. R. G. Chambers, 107
Progress in Nuclear Physics (edited by Prof. O. R. Frisch), Vol. 5, *review* by Dr. T. G. Pickavance, 2
Progress of Plastics (Prof. C. E. H. Bawn), 1098
Progress in Technical Education, 1238
Progress in Under-Developed Countries, 447
Progress and Responsibility in Industry, 347
Progress (Technical) : Industry and—Factors Governing the Speed of Application of Science (Prof C F. Carter and Prof. B R. Williams), *review* by Dr. R. Beeching, 301 ; 305
Progress (Technical), in British Industry, *review* by Dr. R Beeching, 301
Progressive *Verticillium* Wilt of Hops at Wye College, 786
Prolonged Administration of Reserpine : Effect of, on the Endocrine Glands of the Rat (Prof. O. Eränkö, V. Hopsu, E. Kivalo and A. Telkkä), 1130
Prolonged Thyroid Administration : Effect of, on Aged Male Rats (Dr. Lloyd Glenn McArthur, Prof. John F. Lhotka and Dr. Arthur A. Hellbaum), 1123
Promotion of Nature Reserves, Society for the : Fortieth Annual Report, 530
Promotion and Pay for Executives (Dr. George Copeman), *review* by E. F. L Brech, 1153
Properties of Bacterial Protoplasts : Growth and (M. H. Jeynes), 867
Properties of Helicorubin and Cytochrome *h* (Dr. Joan Keilin), 427
Properties of Materials at High Rates of Strain (Institution of Mechanical Engineers Conference on), 584
Properties of Palladium—Rhodium Alloys (Dr. F. E. Hoare and J. Preston), 334
Properties (Fungistatic), of Apple Leaf Wax (Defence Mechanism of Plants against Fungi), (Dr. J. T. Martin, R. F. Batt and R. T. Burchill), 796
Properties (Mechanical), of Non-Metallic Brittle Materials (National Coal Board Conference on), 412
Properties (Physical), of Deoxyribonucleic Acid : Molecular Weights and (Prof. J A. V. Butler, D. J. R. Laurence, A. B Robins and Dr. K. V. Shooter), 1340
Properties (Physical), of Polymers (Plastics and Polymer Group of the Society of Chemical Industry Symposium on), 467
Properties (Physiological) : Kopsine and Strychnine—a Comparative Study of their (Dr. S. R. Mukherjee, Ajit Maiti and P. K. Dey), 916
Properties (Some), of Chromium deposited from an Electrolyte containing Fluoride (N. E. Ryan, F. Henderson, S. T. M. Johnstone and H. L. Wain), 1406
Properties (Surface), of Sodium Octyl Sulphate in Saturated Salt Solutions (E. Matijević and J. Rogers), 560
Property (Repetitive) of the Human Brain as studied by the Electroencephalograph and the Method of After-Images (Dr. Catherine Popov), 328
Proskauer, E. S., and others (edited by) : Organic Analysis, Vol 3, *review* by Dr. W. J. Hickinbottom, 567
Prospecting (Geochemichal). The Principles of (Dr. H. E. Hawkes), 1453
Protection of Persons exposed to Ionizing Radiations : Code of Practice for the, 578
Protection against Radiation : A Code for (Prof. F. W Spiers), 578
Protective Retraction of Coral Polyps : Co-ordination of the (Dr. G. A. Horridge), 421
Protein Antigen associated with Smooth Colony Forms of some Species of *Pasteurella* (Dr. M. J. Crumpton and Dr D A. L. Davies), 863
Protein Chemistry (Peptide and) : Thiols, Disulphides and Thiosulphates—some New Reactions and Possibilities in (Dr. J. M. Swan), 643
Protein Films (Polypeptide and) : Optical Rotation and Infra-Red Spectra of some (Dr A. Elliott, W. E Hanby and B R. Malcolm), 1340
Protein Formation (Blood) in the Rat : Effect of Storage of Methylcellulose on (Margaret M. Frohlich, V. Balázs and S. Benko), 1474
Protein Monolayers : Electron Micrographs of Cross-Sections of (E. H. Mercer), 87
Protein Structure and Biological Activity—Paris Symposium (Dr. Kenneth Bailey), 833
Protein (Serum) Differences in Cattle by Starch Gel Electrophoresis (G. C. Ashton), 917
Proteins of *Bacillus megaterium* Sites of the Incorporation of an Amino-acid into (Dr. G. H. Hunter, Dr. A. R. Crathorn and Prof. J. A. V. Butler), 383
Proteins (Fibrous) : Rapid Observation of Phase Transformation in, using an X-Ray Diffractometer (Dr. A. R. B. Skertchly), 802
Proteins (Fish) : Denaturation of (Dr. A. F M. G. Luijpen), 1422
Proteins (Rat Serum) : Production of, in Irradiated Mice (W. W. H. Weyzen and O. Vos), 288
Proteolysis of Collagen (G. H. Green), 93
Proteolytic Enzymes : Coagulant Action of (Dr. Herbert M. Rubinstein), 1202
Proton Linear Accelerator using a Helical Waveguide : An Experimental (D. R. Chick, D. P R. Petrie, D. G. Keith-Walker and H. Longley), 432
Proton Resonance (Electron and), in a Common Magnetic Field : A Frequency Comparator using (O. Nourse), 192
Proton-Synchrotron at Harwell (National Institute for Research in Nuclear Science), 784
Protons : Excited Levels in Arsenic-75 produced by Radiative Capture of, by Germanium-74 (D. R. Chick and S. E. Hunt), 88
Protoplasts of *Escherichia coli* as Sources and Acceptors of Deoxypentose Nucleic Acid—Rehabilitation of a Deficient Mutant (Prof. Erwin Chargaff, Herbert M. Schulman and Dr. Herman S. Shapiro), 851
Protoplasts (Bacterial) : Growth and Properties of (M. H. Jeynes), 867
Protoplasts (Bacterial), from *Bacillus* Species by the Action of Autolytic Enzymes (F. A. Dark and R E. Strange), 759
Protostrongylus brevispiculum in Great Britain : The Sheep Lungworm (Dr. J. H. Rose, J. F Michel and S. T. Harris), 1372
Proudman, Prof. J. : Awarded the Hughes Medal for 1957 of the Royal Society, 1025, 1232 ; work of, 1232
Prozorova, Miss L. A. : Low-Temperature Physics (Superconductivity—Depth of Penetration in Films of Tin and Mercury), 461
Prunus persica : Soil Transmission of Beet Ringspot Virus to Peach (Dr. B. D. Harrison), 1055
Pruvost, Pierre, et autres : Le Ciel et la Terre, *review* by Bernard Pagel, 59
Pryce, Prof. M. H. L. : The New Physics, *review*, 156
  Appointed to the Advisory Council of the Royal Military College of Science, Shrivenham, 1026
Pryde, Dr. A W. H. : Promoted to Senior Principal Scientific Officer in the Scientific Civil Service, 638 ; work of, 638
Pryor, E. J. : *Obituary* of Prof. J. A. S. Ritson, 1094
Pseudo-Enzyme (True- and) : Insensitivity of Chicken Cholinesterase to Specific Inhibitors of (Prof W. Ferrari), 144
Ps. angulata (*Pseudomonas tabaci* and) : Methionine Biosynthesis and Utilization in (Prof. E. D. Garber and Susan G. Shaeffer), 1282
Pseudomonas tabaci and *Ps. angulata* : Methionine Biosynthesis and Utilization in (Prof E D Garber and Susan G. Shaeffer), 1282
Pseudosarcophaga affinis (Fall) : Effects of Nucleic Acids on Larval Growth, Pupation and Adult Emergence of (H. L. House and J. S. Barlow), 44
Pseudoscarus guacamaia : Occurrence of Periodic Acid—Schiff Positive Material in the Pituitary of the Parrot Fish (Dr. A J. Matty), 1055
Psychiatry and related Sciences . Research Fellowships in (Foundations' Fund for Research in Psychiatry), 953
Psychoanalytic Thought : Schools of (Dr. Ruth L. Munroe), *review* by Dr. Clifford Allen, 772
Psychological and Occupational Aspects of Ageing (British Association for the Advancement of Science, Section J (Psychology), Symposium on), 902
Psychology · Fifteenth International Congress of (Belgian Society of Psychology under the auspices of the International Union of Scientific Psychology), 533
  Military (United States National Academy of Sciences and the National Research Council International Symposium on), 534
Psychology (Comparative) : Ethology and (Conference at the Center for Advanced Study in the Behavioral Sciences, Stanford, California), 362
  Instinct in Man in the Light of Recent Work in (Dr. Ronald Fletcher), *review* by Prof. J. Drever, 1257
Psychology (Industrial), National Institute of (Institute of Personnel Management and the) : Course in the Use of Statistics in Personnel Management, 220
Psychology (Scientific), International Union of (Belgian Society of Psychology under the auspices of the) : Fifteenth International Congress of Psychology, 533
Psychopharmacology : Information Service on (Psychopharmacology Service Center of the United States National Institute of Mental Health), 735
Psychotherapeutic Drugs : The Pharmacology of Psychotomimetic and—Conference held by the Section of Biology, New York Academy of Sciences, 1956 (consulting editor, Seymour S. Kety), *review* by Dr. Marthe Vogt, 304
Psychotomimetic and Psychotherapeutic Drugs : The Pharmacology of—Conference held by the Section of Biology, New York Academy of Sciences, 1956 (consulting editor, Seymour S. Kety), *review* by Dr. Marthe Vogt, 304
Pterins in the Skin of the Green Mamba, *Dendroaspis viridis* : Pigments and (J. A. Blair), 1371

Ptolemaic and Copernican Systems : Galileo on the, *review* by Prof. E. J. Dijksterhuis, 450 ; 1374
Ptukha, Miss T. P. : Low-Temperature Physics (Measurements of the Density of Mixtures of Liquid Helium-3 and Helium-4), 460
Public Accounts, Committee of : Third Report, Session 1956-57, 695
Public Administration, Royal Institute of : Vitality in Administration (Herbert Morrison, Basil Smallpiece, Sir Alexander Fleck, Sir Wilfrid Neden, A. D. Bonham-Carter and Major-General G. N. Russell), 153
  The Making of an Administrator (edited by A. Dunsire), 153
Public Analysts of Great Britain, Association of, and the Food Group of the Society of Chemical Industry : Joint Discussion on Quality Control of Food, 1326
Public Analysts of Great Britain, Association of, and others : Joint Discussion on the Control of Chemical Additives in Food, 692
Public Confidence and Scientific Development, 1439
Public Expenditure on Scientific Projects : Control of, 695
Public Health Hazards . Nuclear Power Stations and, 1096
Public Schools (British), and the Future, 515
Public Works Department, Jamaica : Appointment of D. C. Hendriks as senior surveyor, 688
Publications : Nigerian (1956), 786
Puck, T. T. : Latency and Masking in Viral and Rickettsial Infections (Cells chronically carrying Newcastle Disease Virus), 788
'Puffs' : Incorporation of Phosphorus-32 into Salivary-type Chromosomes which exhibit (Julian D. Gross), 440
Pugh, Dr L. G. C. E. : Physiological Expedition to the Antarctic, 683
Pugh, Sir William : Geological Resources of Britain, 71
Pullularia : Nitrogen Fixation by a Species of (Dr. Margaret E. Brown and Dr. George Metcalfe), 282
Pulse Circuits : Elements of (Dr. F. J. M. Farley), *review* by Dr. R L Smith-Rose, 401
Pulse Circuits and Multivibrators, *review* by Dr R L. Smith-Rose, 401
Pulse Height Analysers : Multichannel—Proceedings of an Informal Conference, Gatlinburg, Tennessee, 1956 (edited by H. W. Koch and R. W. Johnston), *review* by Dr. Denis Taylor, 1381
Pulverized Fuel (Institute of Fuel Conference on), 270, 531
Pulvertaft, R. J. F. : Behaviour and Fate of Lymphocytes (Appearance of Living Human Lymphocytes *in vitro*), 1016
Puparium . A Method of Marking Calliphoridae (Diptera) during Emergence from the (K. R. Norris), 1002
Pupation and Adult Emergence of *Pseudosarcophaga affinis* (Fall.) : Effects of Nucleic Acids on Larval Growth, (H. L. House and J. S. Barlow), 44
Purdom, C. E. : Autonomous Action of Lethal Mutations induced in the Germ Cells of *Drosophila melanogaster* by 2-Chloroethyl Methanesulphonate, 81
Pure and Applied Chemistry, International Union of : Symposium on Geochemistry, 583
Pure and Applied Chemistry, International Union of (Macromolecular Commission) : Tenth International Symposium on Macromolecular Chemistry, 841
Pure and Applied Physics, International Union of : Ninth General Assembly, 1324
  Election of the Executive Committee for 1957-60, 1324
Purification of β-Glucuronidase from Female Rat Preputial Gland (Dr. G. A. Levvy and C. A Marsh), 919
Purified Nucleic Acid Preparations : Induction of Mouse Leukaemia with (Dr. Esther F. Hays, Norman S. Simmons and William S. Beck), 1419
Purine Compounds (Additional), in the Venom of the Tiger Snake (*Notechis scutatus*), (Hazel M. Doery), 799
Purseglove, J. W : Report on work done at the Botanic Gardens, Singapore, during 1956, 1238
Pursell, R. T. : Treatment of Cancer in Dogs by Intravenous Methylene Blue, 1300
Purser, Prof. John : Retirement from the chair of civil engineering in Trinity College, Dublin, 464 ; work of, 464
Putman, J L. : Radiation and Biology (The Physical Basis of Radioactivity), 628
Putnam (Helen) Fellowship for Advanced Research (Harvard University), 738
Putorius furo : Chromosome Number in the Ferret (O. Lande), 1213
Pye, R. W. : Promoted deputy chief scientific officer as head of the Trials Department of the Royal Aircraft Establishment, 1095 ; work of, 1095
Pyke, Dr. Magnus : Modern Analytical Chemistry in Industry, 366
Pyramids (Medullary) : Intracellular Recording from Spinal Motoneurones following Stimulation of (Dr. Roger Merritt Morrell), 709
Pyridine Nucleotide : Structure of a New, isolated from *Penicillium chrysogenum* (Giovanni Serlupi-Crescenzi and Alessandro Ballio), 1203
Pyridine Nucleotides : Vitamin B_{12} and the Metabolism of (Dr. G B. Nadkarni, D S. Wagle and Prof. A Sreenivasan), 659
Pyridine-N-Oxide-2-Thiol : Effect of Copper and Chelating Agents on Growth Inhibition of *Aspergillus niger* by 8-Hydroxyquinoline and (Dr. A. Kaars Sijpesteijn, M. J Janssen and (in part) H. M. Dekhuyzen), 505
Pyrimidine-deficient Fungus . *Fomes lignosus*, a (A. Ruggenbach), 43
Pyruvate and α-Ketoglutarate in Virus-Infected Mouse Brain : Metabolism of (P. L Bradley), 1418
Pyruvic Acid . Conversion of, to Alanine in the Silkworm Larva (T. Fukuda), 245
Pythium mamillatum : Germination of Oospores of, in Response to Exudates from Living Seedlings (Richard Barton), 613

QUADRATIC Relation in Differential Growth (Dr. A. E. Needham), 1293
Qualitative Organic Analysis . Semimicro (Prof Nicholas D. Cheronis and Prof John B. Entrikin), second edition, *review* by Dr. W. J. Hickinbottom, 567
Qualitative Organic Chemical Analysis : A Guide to (Prof. R. P. Linstead and Dr. B. C. L. Weedon), *review* by Dr. W. J. Hickinbottom, 567
Quality Control of Food (Association of Public Analysts of Great Britain and the Food Group of the Society of Chemical Industry Joint Discussion on), 1326
Quantal Responses to Mixtures of Drugs (P. S Hewlett and R. L. Plackett), 712
Quantitative Chemical Analysis (Cumming and Kay), eleventh edition revised by Dr. Robert Alexander Chalmers, *review* by Dr. K. Field, 109
Quantitative Chemical Analysis (Prof. Robert B. Fischer), *review* by G. Fowles, 676
Quantitative Comparison of Sulphydryl Content and Formazan in the Tissues of the Pea Radicle (B. Jámbor, M. Dévay and Dr. L. W. Roberts), 997
Quantitative Estimation of Graphite in Refractory Carbon Deposits by X-Ray Technique (Prof. William A. Fred and Dr. Paul G. Herold), 1273
Quantitative Neuroanatomy, *review* by Prof. B. Delisle Burns, 106
Quantities (Small), of Fluoride · Measurement of, with the Help of Fluorine-18 (Dr. J H Fremlin, Dr. J L. Hardwick and J. Suthers), 1179
Quantity of Radioactive Lecithin and Radioactive Cephalin with Lipositol required to produce Sphering of Mammalian Red Cells (Dr. Eric Ponder and Ruth V. Ponder), 814
Quantum Chemistry (Walter Kauzmann), *review* by Prof. C A. Coulson, 1262
Quarterman, Dr. J., and others : A Difference in the Physiology of the Large Intestine between European and Indigenous Cattle in the Tropics, 552
Quartz Oscillators and their Limitations (Dr. Ponte), 1178
Quastel, Prof. J. H , and others : Effects of Sarcomycin on the Metabolism of Ehrlich Ascites Carcinoma Cells, 1109
Queen Mary College, London : Symposium on Solvent Effects and Reaction Mechanism, 534
Queen's University, Belfast . Appointment of Dr. H. B. Henbest to the chair of organic chemistry, 893, 1025
  Appointment of Dr. J. C. West to the chair of electrical engineering, 953, 1168
  Appointment of Dr. J. Pemberton to the chair of social and preventive medicine, 953
  Appointment of Dr. L. W Kerr as lecturer in physics, 953
  Appointment of Dr. I. C. Roddie and E. W Clarke as lecturers in physiology, 953
  Appointment of Dr. J W. Dundee as lecturer in anaesthetics, 953
  Retirement of Prof. P. L. Burns from the chair of electrical engineering, 1168
Quennell, A. M. : Appointed director of Geological Survey, Tanganyika, 220
Quest for Materials : Technology and the (J. Gray), 735
Quinidine : Effect of Acetylcholine and, on Atrial Cellular Potentials (Dr. Edward A. Johnson and Dr. P. A. Robertson), 1483

RABBIT : Ineffectiveness of Selenium in the Treatment of Nutritional Muscular Dystrophy in the (Prof. H. H. Draper), 1419
Rabbit (Domestic) (*Oryctolagus cuniculus*) and Hare (*Lepus europaeus*) : An Attempt to Cross the (Dr. C. E. Adams), 853
Rabbit Ductus Arteriosus (R. L Holmes), 1058
Rabbit Neutrophils : The Sex-Linked Difference in (P. J. Carpentier, L. A. M Stolte and M. J. Dobbelaar), 554
Rabbit Pituitary Gland : Fixation of the (M. Allanson, Dr. C. L. Foster and G. Menzies), 766
Rabbits : Latent Infection of, by Adenovirus Type 5 (Dr. H. G. Pereira and Barbara Kelly), 615
Radar : Determination of Auroral Height by (R. S. Unwin and Dr. M. Gadsden), 1469
Radar Establishment (Royal), Malvern : International Symposium on Electronic Components, 531
Radar Establishment (Royal), Malvern : Further Radio Observations of the First Satellite, 944
Radar Establishment (Royal), Malvern (Staff of the) : The 45-ft. Radio Telescope at the Royal Radar Establishment, Malvern, 1225
Radar Observations of the First Russian Earth Satellite and Carrier Rocket (Staff of the Jodrell Bank Experimental Station, University of Manchester), 941
Radar Technique (Lunar) : Ionospheric Studies by the (B. C. Blevis), 138
Radars (Centimetric) : 'Angels' on, caused by Birds (W. G. Harper), 847
Radiation : Biological Effects of (Proceedings of the International Conference on the Peaceful Uses of Atomic Energy, Geneva, 1955, Vol. 11), *review* by Dr. T. E. Allibone, 771
  A Code for Protection against (Prof. F. W. Spiers), 578
  Effect of, on Human Heredity (Chronicle of the World Health Organization, Vol. 11, No. 8, Report on), 1178
  Intestinal Damage by, and its Chemical Modification (R. H. Mole and Diana M Temple), 1278
  Uses of Isotopes and, in Agricultural Research (Report of the First Meeting of the European Contact Group, Wageningen, 1956), (Food and Agriculture Organization of the United Nations), 275
Radiation-Induced Chemical Reactions : Dose-Rate Effects in (Dr H. C. Sutton and Prof. J. Rotblat), 1332
Radiation (Adaptive), of Trapdoor Spiders (Barbara Main), 277
Radiation (High-Energy) : Effect of, on Polypropylene (Dr. R. M. Black and Dr. B. J. Lyons), 1346
Radiation (Infra-red) · A Possible Auroral Enhancement of, emitted by Atmospheric Ozone (Wallace B. Murcray), 139
Radiation (Ionizing) : Effect of, on Solid Catalysts (R. W. Clarke and E. J. Gibson), 140
  Effects of, *review* by Dr. T. E. Allibone, 771
Radiation (Multipole), from High-Current Gas Discharges (Dr. S. Kaufman), 1345
Radiation (Red and Far-Red) : Effects of, on Seed Germination (Avishag Kadman-Zahavi), 996
Radiation (Ultra-Violet) : Effect of, on the Respiration-Rates of Tobacco Leaves, and its Reversal by Visible Light (Dr. P. C. Owen), 610
γ-Radiation : Dependence on Oxygen and Temperature of the Sensitivity of Broad Bean Roots to (G. J. Neary), 248
Radiation Biology (edited by Alexander Hollaender, with the co-operation of Sterling B. Hendricks), Vol. 3, Visible and Near-Visible Light, *review* by Dr. Robert Hill, 108
Radiation Effect (Differential) : Lack of, on the Incorporation of Labelled Precursors into Deoxyribonucleic Acid (L. G. Lajtha), 1048
Radiation Effects (Lethal) : Absence of, following Massive Oral Administration of Plutonium (Maurice P. Sullivan and Dr. Roy C. Thompson), 651

Radiation Hazard (X-Ray), using Vacuum Deposition Plant (L Holland), 89
Radiation Lethality and Local Tissue Damage in Histamine-depleted Rats (H. A S. van den Brenk), 1467
Radiation Measurements (Nuclear), during the International Geophysical Year (Dr. Bert Bolin), 311
Radiation Research Visiting Club, 411
Radiation Society of Australia : Formation of a, 120
Radiation Syndrome : The General—Initial Reaction in the Monkey (Prof C. G. Hunter, R. J Munson, W. M. Court Brown and J. D. Abbatt), 1466
Radiation and Biology (British Association for the Advancement of Science (Sections D (Zoology), I (Physiology and Biochemistry), K (Botany) and M (Agriculture), Joint Discussion on), 628
Radiations : Genetical Hazards of (Dr. C Auerbach), 489
Radiations and the Genetic Threat (Dr. Warren Weaver), 489
Radiations (Ionizing) : Code of Practice for the Protection of Persons exposed to, 578
Radiative Capture of Protons by Germanium-74 ; Excited Levels in Arsenic-75 produced by (D. R. Chick and S. E. Hunt), 88
Radicals (Short-lived Free), in Solution : Observation of (Prof G Porter and M. W. Windsor), 187
Radicle (Pea) : A Quantitative Comparison of Sulphydryl Content and Formazan in the Tissues of the (B Jámbor, M. Dévay and Dr. L. W. Roberts), 997
Radio : Frequency Modulation in, *review* by Dr. R. L. Smith-Rose, 206
Radio Astronomy Observatory The Mullard, Cambridge (M. Ryle), 110
Radio Corporation of America : Transistors, Vol 1, 1323
Radio Emission (Linearly Polarized), from the Galaxy An Attempt to detect (J M Thomson), 495
Radio Engineers, British Institution of · Convention on Electronics in Automation, 369
  Clerk Maxwell Premium awarded to Dr. K D. Froome, 529
  Heinrich Hertz Premium awarded to Dr. A. G. Edwards, 529
  Brabazon Premium awarded to K. E. Harris, 529
  Louis Sterling Premium awarded to Dr A. van Weel, 529
  Marconi Premium awarded to Prof. P. M. Honnell, 530
  Dr. Norman Partridge Memorial Award awarded to H. J. Leak, 530
Radio Industry Council Premiums for articles on Electronics, 1325
Radio Noise : Sources of, on the Planet Jupiter (C. H Barrow, T. D Carr and Prof. A. G. Smith), 381
Radio Noise from Planets (F. Horner), 1253
Radio Noise (Solar) · Duration of Transients in (Ö Elgaroy), 808
  Frequency Drift of Short-Time Transients in (Ö Elgaroy), 862
Radio Observations . The 'Dawn Chorus' in (G A. Isted and G. Millington), 716
Radio Observations of the Comet Arend-Roland (G. R Whitfield and J Hogbom), 602
Radio Observations of the First Satellite : Further (Ivan R. King, Prof G. C. McVittie, George W Swenson, jun., and Stanley P. Wyatt, jun.), 943 ; (Norman Lea), 943, *erratum*, 1172 ; (Royal Radar Establishment, Malvern), 944
Radio Observations of the Russian Earth Satellite (Staff of the Mullard Radio Astronomy Observatory, Cambridge), 879
Radio Observations on the Russian Satellite (Radio and Telecommunication Section of the Institution of Electrical Engineers Discussion on), 953
Radio Outbursts (Solar) : Polarization of (Kenji Akabane and Takeo Hatanaka), 1062
Radio Pictures of the Sun (W. N. Christiansen, D. S. Mathewson and J. L. Pawsey), 944
Radio Research 1956—the Report of the Radio Research Board and the Report of the Director of Radio Research, 642
Radio Research Board · Report of the, and the Report of the Director of Radio Research (1956), 642
Radio Research Station, Ditton Park, Slough : The New (Dr R. L. Smith-Rose), 163
Radio Telescope : The Jodrell Bank (Prof A. C B. Lovell), 60
Radio Telescope (The 45-ft) at the Royal Radar Establishment, Malvern (Staff of the Royal Radar Establishment), 1225
Radio Transmission (Transatlantic) : Comparison of Caesium Resonators by (Dr. L. Essen and J. V. L Parry, and J. A. Pierce), 526
Radioactive Carbon Compounds, 636
Radioactive Cephalin with Lipositol . Quantity of Radioactive Lecithin and, required to produce Sphering of Mammalian Red Cells (Dr. Eric Ponder and Ruth V. Ponder), 814
Radioactive Fall-out : Monitoring, 952
Radioactive Lecithin and Radioactive Cephalin with Lipositol . Quantity of, required to produce Sphering of Mammalian Red Cells (Dr Eric Ponder and Ruth V. Ponder), 814
Radioactive Strontium . Rate of Entry of, into Plants from Soil (Dr. R. Scott Russell and G. M. Milbourn), 322
Radioactive and Stable Heavy Nuclides in Ocean Sediments : Localization of (G Arrhenius, M. N. Bramlette and E Picciotto), 85
Radioactivity of Blood Carbon Dioxide in Animals oxidizing Glucose labelled with Carbon-14 and other Labelled Substances (R. J. Robinson and Dr R. V Coxon), 1279
Radioactivity (Body) : Measurement of—Papers given at a Conference on (*British Journal of Radiology*, Supp No. 7), 219
Radiocerium : Removal of Internally Deposited, by the Use of Chelating Agents (Dr. A. Catsch and Du Khuong Lê), 609
Radiochemical Centre, Amersham (Dr W P. Grove), 1228
Radio-frequency Field (Non-uniform) : Charged Particles in a (Dr H. A. H. Boot and R. B. R.-S. Harvie), 1187
Radioisotopes in Scientific Research—Unesco Conference (Dr. H. Seligman), 1029 ; Biological Sciences Sessions (Dr. R. Scott Russell), 1030
Radioisotopes and Glass (Society of Glass Technology Symposium on), 1098
Radiology, British Institute of : Nineteenth Annual Congress, 1028
Radiology, British Journal of · Supp No 7, Papers given at a Conference on the Measurement of Body Radioactivity, 219
Radiosensitivity of Bacteria : Effect of Nitric Oxide on the (P. Howard-Flanders), 1191
Radiosensitivity of Salt Uptake in Plants (D. A. Barber, Dr. G. J Neary and Dr. R. Scott Russell), 556
Radnor, Earl of · *Obituary* of Lord Clinton, 312
Radon and Thoron in Air : Determination of (G. B Courtier), 382
Raether, H. : Ionization Phenomena in Gases (Townsend and Streamer Mechanisms), 791
Railston, Dr. William · Seconded as scientific and technical adviser to the Commonwealth Relations Office, with special responsibility for the scientific problems of the Colombo Plan, 172
Raimes, Dr S : A New Cosmology, *review*, 302
Raine, Dr. Laureen (Latner, Dr. A. L , and) : Effect of Analogues on the Uptake of Vitamin B_{12} by the Intact Rat, 1197
Rainey, Dr. R. C. · Bioclimatology and Biometeorology (Microclimate and its Effects on Life), 1328
Rainfall : Meteor Orbits and, 737
Rainfall Organization, British : Memorial to G. J Symons, 313
Rakestraw, N. W., and others (edited by) : Oceanic Observations of the Pacific, 1949, *review* by Dr. G. E. R. Deacon, 877
Ramachandra Rao, Dr. B. (Subbarao, K., and) : A Simple Method of Determining Ultrasonic Velocities in Rocks, 978
Ramachandran, G. N. : Recent Advances in Gelatin and Glue Research (Modification of Collagen and Gelatin by Chemical Means), 691
Ramanathan, K. (Bright, Dr. A. W , and) : Discharges in Hydrogen at the Ion Cyclotron Frequency, 1468
Rams and Wethers (Romney) : Photoperiodicity and Wool Growth in (Dr A. B. Wildman), 296, *erratum*, 1098
Ramsay Memorial Trust : Fellowship Awards for 1957-58, 316
Ramsbottom, Dr. J. Linnean Anniversary Celebrations, 739
  Forest Fungi, *review*, 1155

Ranby, Dr. B. : Fundamental Aspects of Fibres and their Treatment for Papermaking (Morphology of Pulp Fibres—Fine Structure of the Cellulose Fibrils), 1175
Rance, Dr H. F : Fundamental Aspects of Fibres and their Treatment for Papermaking (Bonded-Fibre Assemblages), 1177
Randle, Dr Philip J Annual Review of Biochemistry—a Perennial Problem, *review*, 1307
Random, Moving Surfaces : The Statistical Analysis of a (Dr M S. Longuet-Higgins), 228
Rankin, Prof. J. S. : Technical Schools in Prague—250th Anniversary, 639
Ranque Vortex-Tube Combustion Chamber (Prof. J. M. F. Vickers), 1271
Raphael, Prof. R. A : Heterocyclic Compounds, *review*, 352
  Recent Advances in the Chemistry of Terpenoid Compounds (Total Synthesis of Iridodial and related Substances), 471
  Appointed to the regius chair of chemistry in the University of Glasgow, 1025 ; work of, 1025
Rapid Estimation of the Areas of the Leaves of Crop Plants (Dr. P. C. Owen), 611
Rapid Extraction with Ethyl Acetate of Free Fluorescein Derivatives from Fluorescein *iso*Cyanate-Globulin Conjugates (Dr. J. K. Dineen and G. L Ada), 1284
Rapid Procedure for the Separation of Amino-Acids on Paper Chromatograms (Henry R Roberts and Michael G. Kolor), 384
Rarer Metals · Extraction and Refining of the (Proceedings of a Symposium on Extraction Metallurgy of some of the Less Common Metals arranged by the Institution of Mining and Metallurgy, London, 1956), *review* by A. R. Bailey, 258
Rasmussen, Howard, and Westall, Roland : Chemical Nature of Parathyroid Hormone, 1429
Raspberry Mosaic Viruses : Transmission of, to the Strawberry (R. Stace-Smith and F. C. Mellor), 172
Rastrelliger kanagurta (Cuv) : Differences in the Food of the Young and the Adult Indian Mackerel (K. V. Narayana Rao and Dr. K. Pampapathi Rao), 711
Rat : Effect of Angiotonin on the Distribution of Sodium, Potassium and Water in the (Prof. Sydney M Friedman, Constance L. Friedman and Miyoshi Nakashima), 194
  Effect of Prolonged Administration of Reserpine on the Endocrine Glands of the (Prof O. Eränkö, V. Hopsu, E. Kivalo and A Telkkä), 1130
  Effect of Storage of Methylcellulose on Blood Protein Formation in the (Margaret M. Frohlich, V. Balázs and S. Benko), 1474
  Influence of Hexanitrodiphenylamine on the Incidence of Neoplasms in the Mammary Tissue of the (G J. van Esch, H H Vink and H. van Genderen), 509
Rat (Albino) : A Route for Intravenous Injection in the (Kenneth A. Pearce), 709
Rat (Intact) : Effect of Analogues on the Uptake of Vitamin B_{12} by the (Dr. A. L Latner and Dr. Laureen Raine), 1197
Rat Breeding and Ringtail : Effect of Relative Humidity on (Leif Rein Njaa, Finn Utne and Olaf R Braekkan), 290
Rat Liver : Role of Organ-Specific Antigen during 4-Dimethylaminoazobenzene Carcinogenesis in the (P E Hughes, C J Louis, J K. Dineen and W. G Spector), 289
Rat Preputial Gland (Female) · Purification of β-Glucuronidase from (Dr. G. A Levvy and C A Marsh), 919
Rat Serum Proteins · Production of, in Irradiated Mice (W. W H Weyzen and O Vos), 288
Rat Skin Grafts in Mice : Surviving (O. Brocades Zaalberg, O Vos and D W. van Bekkum), 238
Rat Tissue : Carnosine and Carnosinase in (T. Wood), 39
Rat Tissues · Catechol Compounds in, and in Brains of Different Animals (Dr K A. Montagu), 244
Rate of Entry of Radioactive Strontium into Plants from Soil (Dr. R Scott Russell and G. M. Milbourn), 322
Rates (High), of Strain : Properties of Materials at (Institution of Mechanical Engineers Conference on), 584
Rats · Attempt to Transplant the Œdema Fluid of Experimental Inflammatory Œdema in (Dr E Kelemen), 710
  Induction of Immunological Tolerance in, to Foreign Erythrocytes (Dr. G. J V. Nossal), 1427
  Influence of Post-Irradiation Administration of Methionine on the Levels of Deoxyribonucleic Acid in Bone Marrow, Spleen and Liver of (M K. Nerurkar, A. J Baxi, N. S Ranadive, M. V. Nerurkar and M. B Sahasrabudhe), 193
  An Unsuspected Factor which influences Consumption of Alcohol by (R. J G. Gillespie and Prof. C C Lucas), 1292

Rats (Aged Male) : Effect of Prolonged Thyroid Administration on (Dr. Lloyd Glenn McArthur, Prof. John F. Lhotka and Dr. Arthur A. Hellbaum), 1123
Rats (Albino), treated during the Embryonic or New-born Period with Rous Sarcoma Virus : Development of Multiple Cysts and of Haemorrhagic Affections of Internal Organs in (G. J. Švec-Moldavsky), 1299
Rats (Growing Diabetic) : Action of Glucose-1-Phosphate on the Deposition of Phosphate in the Bones of (Dr. N. Siliprandi, G. De Bastiani, F. Petrelli and B. Fischetti), 1357
Rats (Histamine-depleted) : Radiation Lethality and Local Tissue Damage in (H. A. S. van den Brenk), 1467
Rats (Normal and Adrenalectomized) : Influence of Starvation and Glucose Load on the Activity of Liver Phosphorylase in (Dr. N. Schwartz Sorensen), 857
Rats (Pretreated) : Serological Changes Concomitant with the Growth of Mouse Tumours in (M. Pikovski, C. Tal, M. Schlesinger and E. Margoliash), 185
Rattle-snake Venom : Phosphodiesterase from (Prof. M. Laskowski, Gloria Hagerty and Ulla-Riita Laurila), 1181 ; (Dr. Hans G. Boman), 1182
Rau, R R., and others (compiled and edited by) : High Energy Nuclear Physics—Proceedings of the Sixth Annual Rochester Conference (1956), *review* by Sir John Cockcroft, 303
Raven, Rev C E. : Retirement as president of the Field Studies Council, 1028
Raw Wool : Actinomycete Disintegration of (Melva E. Philipson), 1205
Rawlins, F. I. G : Wittgenstein's Accomplishment, *review*, 399
  Thought, Life and Time as reflected in Science and Poetry, *review*, 676
  Art and Analysis, *review*, 1267
Rawson-Bottom, W. E , and Cooper, B. S. : Natural and Artificial Lighting in Museums, 1323
Ray, N. H. : Gas Chromatography, 403
Raymond, J. E. : Awarded the Polar Medal, 18
γ-Rays : Effect of, on the Sprouting of Stored Mangolds (C. E. Cornford and D. B. Powell), 996
  Effect of Exposure to, on the Hygroscopicity of Sitka Spruce Wood (J. M. Paton and R. F S. Hearmon), 651
  Role of Structural Degradation in the Loss of Serological Activity of Ovalbumin Irradiated with (Hugo Fricke, Charles A. Leone and Wendell Landmann), 1423
γ-Rays (Cobalt-60) : Response of the Ceric-Cerous System at High Dose-Levels of (B. Whittaker), 1302
Reacting Bile Pigment : Sodium Salt of the Directly (Dr. Ed. Talafant), 1051
Reaction : Experimental Thermochemistry—Measurement of Heats of (edited by Frederick D Rossini), *review* by Dr. E. F. G. Herington, 57
  Oxidation of Pentane in Mixtures with Air and the Negative Temperature Coefficient of (R O. King, S. Sandler and R. Strom), 335
Reaction of Bromine with Uracils (Dr. Shih Yi Wang), 91
Reaction of Carbon Monoxide with Evaporated Barium Films (R. N. Bloomer), 249
Reaction of Globin with Haemin in Interfacial Films (F. Haurowitz, M. Dicks and D. G. Therriault), 437
Reaction of Nitrates with Liquid Sulphur Dioxide (Dr. K. J. Ivin), 90
Reaction (Biological) : Chemical Model of a (Prof. Alexander Gero and Curtis L. Withrow), 1354
Reaction (Density-governing), in *Sminthurus viridis* (L.) : Field Evidence of (M. M. H. Wallace), 388
Reaction (Initial), in the Monkey : The General Radiation Syndrome—(Prof. C. G. Hunter, R. J. Munson, W. M. Court Brown and J. D Abbatt), 1466
Reaction Mechanism : Solvent Effects and (Queen Mary College, London, Symposium on, under the auspices of the Chemical Society), 534
Reactions : ZETA Apparatus for Controlled Thermonuclear (Atomic Energy Research Establishment), 1097, 1451
Reactions (Biochemical) : Some Principles of Energetics in (Prof. Irving M. Klotz), *review* by Dr. Herbert Gutfreund, 207
Reactions (Chemical) : Encyclopedia of (compiled by Prof. C. A. Jacobson), edited by Clifford A. Hampel, Vol 6, Samarium, Scandium, Selenium, Silicon, Silver, Sodium, *review* by Prof. W. Wardlaw, 6
  Some Observations on the Mechanism of (Sir Cyril Hinshelwood), 1233
Reactions (Polymerization) : A Dilatometric Method of Following the Non-stationary State of (Dr. W. I. Bengough), 1120
Reactions (Radiation-induced Chemical) : Dose-Rate Effects in (Dr. H. C. Sutton and Prof. J. Rotblat), 1332
Reactions (Serological) : Use of Logarithms to the Base 2 in Recording (John W. Vennes, Russell E. MacDonald and Philipp Gerhardt), 363
Reactions (Some New), and Possibilities in Peptide and Protein Chemistry : Thiols, Disulphides and Thiosulphates— (Dr. J M. Swan), 643
Reactions (Thermonuclear) : Industrial Applications of (British Association for the Advancement of Science, Section A (Mathematics and Physics), Discussion on), 780
Reactive Intermediates of Organic Chemistry (John E. Leffler), *review* by H. S. Turner, 1269
Reactor : PLUTO—Materials Testing, at Harwell, 952 ; Construction of, 952
Reactors (Gas-cooled) : Creep Tests on Materials for (New research equipment in the Materials Research Laboratory of the General Electric Company's Atomic Energy Division), 1392
Read, B. E., and others : Rheology of Elastomers (Elastic Recovery, Flow and Stress Relaxation), 76
Read, Prof. John : Development of Industrial Chemistry, *review*, 723
Realities of Space Travel—Selected Papers of the British Interplanetary Society (edited by L. J. Carter), *review* by Prof. D. R. Bates, 453
Réaumur, R. A. F. de : Memoirs on Steel and Iron (a translation from the original printed in 1722, by Anneliese Grunhaldt Sisco), *review* by Prof. F C. Thompson, 1263
Réaumur on Steel, *review* by Prof. F. C. Thompson, 1263
Rearing of *Simulium damnosum* Theobald (Diptera, Simuliidae) in the Laboratory (F. N. Wright), 1059
Rebka, jun., G. A., and Pound, Prof. R. V : Time-correlated Photons, 1035
Recent Man (Fossil and) : Tooth Eruption Sequence in (Dr. Stanley M. Garn and Dr. Kalevi Koski), 442
Recherche scientifique, Centre National de la : Colloque sur la Biochimie du Soufre, Roscoff (1956), 466
  International Colloquium on Interference Spectroscopy, 955
Recherche scientifique en Afrique Centrale, Institut pour la : Seventh Annual Report (1954), 837
Recombinations in *Streptomyces rimosus* : (S. I. Alikhanian and S. Z. Mindlin), 1208
Reconsideration of Affect, *review* by Dr. Clifford Allen, 936
Recording Serological Reactions : Use of Logarithms to the Base 2 in (John W. Vennes, Russell E MacDonald and Philipp Gerhardt), 1363
Recording (Intracellular), from Spinal Motoneurones following Stimulation of Medullary Pyramids (Dr. Roger Merritt Morrell), 709
Recording (Seismic), of Atomic Explosions in Australia (H. A Doyle), 132
Records and Research in Engineering and Industrial Science (Dr. J Edwin Holmstrom), third edition, *review* by R. Brightman, 453
Recrystallization Phosphors · Thallium-activated Sodium Chloride (Z. Morlin), 89
Recrystallization and the Ductility of Chromium (S T. M. Johnstone, F. Henderson and H. L Wain), 806
Rectifying Semi-Conductor Contacts (H. K. Henisch), *review* by Dr. A. A. Shepherd, 566
Red Algae (1906-56 and After), (Dr. Kathleen M. Drew) 112
Red Cell Membrane (Human) : Search for a Potassium Compartment in the (A. K. Solomon, June Loucks, Daniel A. Pollen, Thomas J. Gill, 3rd., and Elizabeth Wolf), 993
Red-Cell Survival in Familial Haemolytic Anaemias (Dr. Robert L Evans), 1435
Red Cells : Surface Alteration and the Agglutinability of (Prof. Merwin Moskowitz and Saul Carb), 1049
Red Cells (Mammalian) : Quantity of Radioactive Lecithin and Radioactive Cephalin with Lipositol required to produce Sphering of (Dr. Eric Ponder and Ruth V. Ponder), 814
Red Prawns : Pink Shrimps and, 892
Red and Far-Red Radiation : Effects of, on Seed Germination (Avishag Kadman-Zahavi), 996
Red-legged Partridge, *Alectoris rufa*, and the Pheasant, *Phasianus colchicus* : *Sarcocystis* sp. in the (P. A. Clapham), 1294
Reddi, Dr. K. K., and Knight, Dr. C A. . Terminal Groups of Tobacco Mosaic Virus Nucleic Acid, 374
Reddick, Prof. Harry W., and Kibbey, Prof. Donald E. : Differential Equations, third edition, *review* by Dr. L. S. Goddard, 58
Redding, T. H. : Flow Coefficients, 1393
Redfield, A. C · The Abyssal Circulation of the Ocean, 733
Redman, Prof. R. O. . International Astronomy, *review*, 824
Reduction of Nitrofurazone by Bacteria : Site of (Dr. A H Beckett and Ann E. Robinson), 1206
Reece, M. P. : The Tanberg Effect, 1347
Reed, Dr. George W , and Turkevich, Prof. Anthony · Uranium, Helium and the Ages of Meteorites, 594
Reed, Dr. R. (Hall, Dr. D. A., and) : Hydroxyproline and Thermal Stability of Collagen, 243
Rèekie, Dr. James : Appointed chief engineer to Semiconductors, Ltd., Ilford, 787 ; work of, 787
Rees, Dr. H. : Distribution of Chiasmata in an 'Asynaptic' Locust, 559
Rees, W. ap , and others : Genetically-controlled Differences in Catalase Activity of Dog Erythrocytes, 649
Rees, Dr. William J. : Evolutionary Trends in the Classification of Capitate Hydroids and Medusae, 130
  Status of *Moerisia lyonsi* Boulenger and related Hydroids, 445
Reeves, E. M. (Nicholls, Prof. R. W., and) : Luminescence produced in Air by Polonium-210 α-Particles, 1188
Refinery Production, 1955 and 1956 : United Kingdom Petroleum Industry Statistics relating to Consumption and (Petroleum Information Bureau), 361
Refining of the Rarer Metals : Extraction and (Proceedings of a Symposium on Extraction Metallurgy of some of the Less Common Metals, arranged by the Institution of Mining and Metallurgy, London, 1956), *review* by A. R. Bailey, 258
Reflections on International Administration (A. Loveday), 933
Refractory Carbon Deposits : Quantitative Estimation of Graphite in, by X-Ray Technique (Prof. William A Fred and Dr. Paul G. Herold), 1273
Refrigerants (Boiling) : Suppression of Bubbling in (Dr. G. J. Minkoff, Floyd I Scherber and Alfred K. Stober), 1413
Refrigerating Machine, *P. W. 7000* : Philips Gas, 892
Regard the Earth (Dr. R. Fraser), 269
Regional Advisory Council for Higher Technological Education, London and Home Counties : Bulletin of Special Courses in Advanced Technology, 635
  Research for Industry, 785
Regional Museum Service, 836
Regnault, R. H. : Appointed deputy director, Lands, Mines and Surveys, Fiji, 220
Regular Patterned Stimulation : Some Further Visual Phenomena associated with (Dr D. M. MacKay), 1145
Regular Stationary Patterns : Moving Visual Images produced by (Dr. D. M. MacKay), 849
Rehabilitation of a Deficient Mutant : Protoplasts of *Escherichia coli* as Sources and Acceptors of Deoxypentose Nucleic Acid— (Prof. Erwin Chargaff, Herbert M. Schulman and Dr Herman S. Shapiro), 851
Reid, Prof. C., and Connor, T. M. : Delocalization in Hydrogen Bonds, 1192
Reid, K. J. : Awarded a Research Scholarship by the Gas Council, 530
Reid, P. R. : Appointed assistant conservator of forests, Federation of Nigeria, 688
Reineckate (Ammonium) : Determination of Papaverine and Narcotine by using (Dr. Lee Kum Tatt and Dr. Charles G Farmilo), 1288
Reinterpretation of some Basal Structures in the Insect Ovipositor (G. G. E. Scudder), 340
Reissner, Eric (Martin, William Ted, and) : Elementary Differential Equations, *review* by Dr. L. S. Goddard, 58
Reith, J. W S. : Trace Elements in Soils, Plants and Animals (Copper Nutrition in Ruminants), 25
Reith, J W. S., and others · Trace Elements in Soils, Plants and Animals (Composition of Grass), 24
Reith Lectures for 1957 (Prof. George F. Kennan), 893
Relation of Colchicine to Chromosome Breakage (Douglas Davidson), 1059

Relation between Ribonuclease Activity and Ribonucleic Acid Content (L Ledoux, A Pileri, F. Vanderhaeghe and S. Brandli), 1048
Relation of Size of Electroretinogram to Rhodopsin Concentration in Normal Human Beings and one Totally Colour Blind (Dr. V. Elenius and Dr J. Heck), 810
Relation of Structure of 2,4-Dichlorophenoxyacetate to its Mode of Action as an Auxin (Emmett J Johnson and Prof. Arthur R. Colmer), 1365
Relation between the Ultimate Upper Lethal Temperature and the Temperature-range for Good Health in the Roach (*Rutilus rutilus*), (Dr. A W. Cocking), 661
Relationship to Chelation of Zinc : Dwarf *Drosophila* produced by Ethylene Diamine Tetra-acetic Acid—a (Dale Steffensen), 390
Relationship between the Concentration of Anionic Surface-active Agents and the Electrophoretic Mobility and Viability of *Aerobacter aerogenes* (Dr D E E. Loveday and Dr A. M. James), 1121
Relationship to Death of Guinea Pigs from Plague . Lethality for Guinea Pigs of Ultrasonic Extracts of *Pasteurella pestis*—its (J. Keppie, H. Smith and E. C. Cocking), 1136
Relationship between the Hydrolysis of Adenosine Triphosphate and Oxidative Phosphorylation (W C. Hülsmann and Prof. E. C. Slater), 372
Relationship between Shoot Apex and Effect of Gibberellic Acid on Elongation of Pea Stems (A. J. Vlitos and W. Meudt), 284
Relationship of the Strength of High Solids Pectin Gels to the Concentration and Jelly-forming Capacity of the Pectin Present (Dr. Peter Wade), 1067
Relationship (Probable Evolutionary), of Serotonin and Indoleacetic Acid, and some Practical Consequences Therefrom (Dr. D. W. Woolley), 630
Relative Humidity : Effect of, on Rat Breeding and Ringtail (Leif Rein Njaa, Finn Utne and Olaf R. Braekkan), 290
Relativity · The Clock Paradox in (Sir Charles Darwin), 976 ; (Dr. L. Essen), 1061 , (Prof. Herbert Dingle), 1275
Relativity and Space Travel (J. H. Fremlin), 499 ; (Prof Herbert Dingle), 500
Relaxation Spectrometry (Prof. E. G Richardson), *review* by Dr. P. Feltham, 1269
Release of the Ovarian Development Hormone in *Aedes aegypti* . Variation in the Time of (Dr. J. D. Gillett), 656
Religion and Humanism, *review* by Dr A Macbeath, 565
Religion without Revelation (Dr. Julian Huxley), new edition, *review* by Dr. A. Macbeath, 565
Removal of Internally Deposited Radiocerium by the Use of Chelating Agents (Dr. A. Catsch and Du Khuong Lê), 609
Renal Uptake (Early), of Potassium-42 : Demonstration of, by an Autoradiographic Method for Water-soluble Isotopes of Short Half-life (Dr V. D. Essen and Dr F. T. C. Harris), 440
Rennie, C A. : Economics of Nuclear Energy, *review*, 673
Rennie, Dr. P. J : Effect of the Afforestation of Catchment Areas upon Water Yield, 663
Rennin : Activity and Specificity of (J. C Fish), 345
Rensch, B. · Systematics of To-day (Die Ideale Artbeschreibung), 740
Renton, C. A (Fuschillo, Prof N , and) : Nuclear Magnetic Resonance of Methane adsorbed on Titanium Dioxide, 1063
Repetitive Property of the Human Brain as studied by the Electroencephalograph and the Method of After-Images (Dr. Catherine Popov), 328
Reproduction in Trilobites · Supposed Asexual (Dr. Henning Lemche), 801
Reptiles (Sauropsid) : On *Millerosaurus* and the Early History of the (Prof. D. M S Watson), 128
Republic of Ireland, *review*, 489
Research—a Signpost to Better Management (Twelfth National Conference of the British Institute of Management), 270
Research in Central Africa, 827
Research : Building (1956)—Report of the Building Research Board with the Report of the Director of Building Research, 1032
  Chemistry (1956)—the Report of the Chemistry Research Board with the Report of the Director of the Chemical Research Laboratory, 80
  Forest, in Britain (Dr. E. W. Jones), 967
  Hydraulics (1956)—Report of the Hydraulics Research Board with the Report of the Director of Hydraulics Research, 171
  The Microscope in Industry and (W. Watson and Sons Ltd , Exhibition on), 787
  Operational (Operational Research Society (United Kingdom), the Operations Research Society of America, and the Institute of Management Sciences (New York), Conferences on), 363, 1087
  Radio (1956)—the Report of the Radio Research Board and the Report of the Director of Radio Research, 642
  Road (1956)—the Report of the Road Research Board with the Report of the Director of Road Research, 588
  Scientific and Industrial, in Britain, 1237
  The Strategy of (Sir George Thomson), 1223
  Sugar, in Mauritius, 218
  Water Pollution (Dr T T. Macan), 273
Research and the Research Worker, 1223
Research Guide, 1323
Research on Ageing, British Society for . Symposium on the Biology of Hair Growth, 592
Research in the Biosciences, a Mid-Century Perspective (W H Cook), 267
Research in Dairying, National Institute for . Report for 1956, 965
Research in Engineering and Industrial Science : Records and (Dr. J. Edwin Holmstrom), third edition, *review* by R. Brightman, 453
Research in Experimental Leukaemia · Silvina Estrada de Acevedo Fellowship for, 530
Research for Industry (London and Home Counties Regional Advisory Council for Higher Technological Education), 785
Research on Metal Coatings—British Iron and Steel Research Association, South Wales Laboratories, 123
Research in Nuclear Science, National Institute for : Work on the, 315
  Proton-Synchrotron at Harwell, 784
  New Laboratory to be called the Rutherford High Energy Laboratory, 1391
  Appointment of Dr T. G Pickavance as first director of the Rutherford High Energy Laboratory, 1391
Research on Roads in Britain (T. M. Charlton), 588
Research on Wool : Finance for, 170
Research (Advanced) : Helen Putnam Fellowship for (Harvard University), 738
Research (Agricultural) Uses of Isotopes and Radiation in (Report of the First Meeting of the European Contact Group, Wageningen, 1956), (Food and Agriculture Organization of the United Nations), 275
Research (Agricultural and Forestry), in East Africa, 786
Research (Biological) Physical Techniques in (edited by Gerald Oster and Arthur W Pollister), Vol I, Optical Techniques ; Vol. 2, Physical Chemical Techniques ; Vol. 3, Cells and Tissues, *review* by Prof. J A. V Butler, 1009
Research (Biophysics), at King's College, London, 891
Research (Cancer) . Progress of, 1312
Research (Enzyme) Some Modern Aspects of, *review* by Prof. D D Woods, 1379
Research (Fundamental), on Paper-making Fibres (Dr Julius Grant), 1175
Research (Gelatin and Glue) Recent Advances in (British Gelatine and Glue Research Association Conference on), 690
Research (Government Scientific) The Balance of, in Britain, 720
Research (Marine) : International Co-operation in (Dr. G. E R Deacon), 894
Research (Mental Deficiency), Journal of, Vol. 1, No. 1, 1322
Research (Nuclear Energy), Dutch—Norwegian Joint Establishment for . Fifth Annual Report (1955-1956), 794
Research (Operational), and Cybernetics in Industry (Lectures arranged by the Department of Operational Research and Cybernetics of the United Steel Companies, Ltd , in co-operation with the Sheffield College of Commerce and Technology), 72, 531
Research (Pancreatic) Use of Pilocarpine in (Dr. Winifred S. Morgan), 987
Research (Pneumoconiosis Field) The National Coal Board's (Dr. J. W. J. Fay), 309
Research (Postgraduate) . British Oxygen Fellowships for (Awards), 270
Research (Scientific) . Radioisotopes in (Unesco International Conference on), 1029
Research (Scientific), in British Universities (1956-57), 1323
Research (Scientific), in Schools (Joint Committee of the Royal Society and the Science Masters' Association to consider), 1393
Research (Ultra-structure), Journal of, No. 1, 1452
Research Biochemicals : Catalogue of (Nutritional Biochemicals Corporation, Cleveland), 1098
Research Council of Alberta : Thirty-seventh Annual Report (1956), 176
Research Fellowship (Alan Johnston, Lawrence and Moseley), of the Royal Society awarded to Dr. P. C. Caldwell, 119
Research Fellowship (Stothert), of the Royal Society awarded to Dr. M. J. R. Dawkins, 119
Research Fellowship in Tuberculosis : Dorothy Temple Cross (Medical Research Council Award for 1957-58), 315
Research Fellowships in Psychiatry and related Sciences (Foundations' Fund for Research in Psychiatry), 953
Research Headquarters of Thomas Hedley and Co., Ltd. : New (Dr. E. R. Wilson), 364
Research Institute (Animal Virus Diseases) : Open Days (Dr. Ian A. Galloway), 210
Research Laboratories (Physics) : The Design of (London and Home Counties Branch of the Institute of Physics Symposium on), 838
Research Medal of the Royal Agricultural Society of England, 1171
Research Scholarships (Gas Council Awards), 530
  B.B C. Awards, 787
Research Studentships for Postgraduate Training in Ecology (Nature Conservancy Awards for 1957), 467
Research Training Scholarships for 1957-58 awarded by the Animal Health Trust to F. A. Harrison, D F Kelly and D. B. Ross, 412
Research Worker : Research and the, 1223
Research and Development in Nuclear Energy, 397
Research and Development (Aeronautical), Advisory Group for : Seventh General Assembly, 737
Research and Teaching : Agricultural, at Cambridge, Vol I (University of Cambridge School of Agriculture), 227
Researches in Marine Biology (John S. Colman), 745
Reserpine : Effect of Prolonged Administration of, on the Endocrine Glands of the Rat (Prof. O. Eränkö, V Hopsu, E. Kivalo and A Telkkä), 1130
Reserpine Antagonists : 3,4-Dihydroxyphenylalanine and 5-Hydroxytryptophan as (Prof. Arvid Carlsson, Margit Lindqvist and Tor Magnusson), 1200
Residence · Halls of (Report of the University Grants Committee Sub-Committee on), 1005
Residential Course on Tensors in Electrical Engineering (Extra-Mural Department of the University of Liverpool), 369
Resins (Phenolic) : The Chemistry of (Robert W. Martin), *review* by Prof. C. E H. Bawn, 672
Resistance to Altitude Anoxia : Alimentary Lipaemia and (Bedřich Mosinger and Eduard Kuhn), 1140
Resistance of 9-α-Fluoro-11-β-Hydroxyprogesterone to Inactivation in the Liver of the Guinea Pig (Prof. A Lipschutz, Dusan Jadrejevic, Santiago Figueroa and Silvia Girardi), 508
Resistance (Insecticide), in *Anopheles sundaicus* (G Davidson), 1333
Resolution (Extreme) : Microphotography—Photography at (Dr. G. W. W. Stevens), *review* by Dr R. Barer, 622
Resonance . Ion Cyclotron (Dr. R. F. Saxe), 87
Resonance (Electron) · Binding in Haemoglobin Azide as determined by—Electron Resonance Studies of Haemoglobin Azide and Hydroxide Derivatives (J F Gibson and Dr D J E. Ingram), 29 ; Theory of Electron Resonance in Ferrihaemoglobin Azide (J. S Griffith), 30
  Theory of, in Ferrihaemoglobin Azide (Binding in Haemoglobin Azide as determined by Electron Resonance), (J S Griffith), 30
Resonance (Electron and Proton), in a Common Magnetic Field : A Frequency Comparator using (O Nourse), 192
Resonance (Nuclear Magnetic), of Methane adsorbed on Titanium Dioxide (Prof. N Fuschillo and C A. Renton), 1063
Resonance Studies (Electron) of Haemoglobin Azide and Hydroxide Derivatives (Binding in Haemoglobin Azide as determined by Electron Resonance), (J F. Gibson and Dr D J. E. Ingram), 29
Resonance Studies (Nuclear Magnetic), of Boron Trifluoride Complex Formation (P Diehl and R A. Ogg, Jun.), 1114
Resonators (Caesium) · Comparison of, by Transatlantic Radio Transmission (Dr L Essen and J. V L. Parry, and J A Pierce), 526

Respiration-Rates of Tobacco Leaves : Effect of Ultra-Violet Radiation on the, and its Reversal by Visible Light (Dr. P. C. Owen), 610
Respiratory Characteristics of Marine Bacteria (Joseph R. Merkel, Angelo F Carlucci and Prof. David Pramer), 1489
Respiratory Metabolism of Aerated Potato Disks (Nona Calo, Joy Marks and J. E. Varner), 1142
Response of the Ceric-Cerous System at High Dose-Levels of Cobalt-60 γ-Rays (B. Whittaker), 1302
Response to Light Stimuli : Changes in, of the Larvae of *Culicoides circumscriptus* (Dr. P. Becker), 559
Response (Co-ordinated), to Stimuli in Coral Polyps (Dr. N B. Eales), 421
Responses of *Cerianthus* to Stimulation (Dr. D. M. Ross), 1368 ; (Dr. G. A. Horridge), 1369
Responses (Quantal), to Mixtures of Drugs (P S. Hewlett and R. L. Plackett), 712
Responsibility for Atomic Energy Developments, 1097
Responsibility in Industry : Progress and, 347
Resumption of Gonadotrophic Function in Pituitary Grafts following Retransplantation from Kidney to Median Eminence (M. Nikitovitch-Winer and J. W. Everett), 1434
Retention of Marine Phytoplankton by Membrane Filters : Variability in (Dr. Reuben Lasker and Robert W. Holmes), 1295
Reticulo-Endothelial System : Effect of Experimental Biliary Obstruction on the Phagocytic Activity of the (B. N Halpern, G. Biozzi, Prof. T. Nicol and D. L. J. Bilbey), 503
  Physiopathology of the—a Symposium organized by the Council for International Organizations of Medical Sciences (edited under the direction of B. N. Halpern by B. Benacerraf and J. F. Delafresnaye), *review* by Prof T. Nicol and D. L. J. Bilbey, 1155
Retinal Chemistry and the Physiology of Vision (Prof. G. Wald), 1395
Retraction (Protective), of Coral Polyps : Co-ordination of the (Dr. G. A. Horridge), 421
Retransplantation from Kidney to Median Eminence : Resumption of Gonadotrophic Function in Pituitary Grafts following (M. Nikitovitch-Winer and J W. Everett), 1434
Retzius Gold Medal of the Swedish Society of Physicians awarded to Prof. Ragnar Granit, 738
Revelation : Religion without (Dr. Julian Huxley), new edition, *review* by Dr. A. Macbeath, 565
Reversal of Boric Acid Inhibition of Growth in certain Soil Micro-organisms (Alan M. Shefner and Betty J. Burkhardt), 1207
Reversal in Mercury-198 Lamps : Prevention of (K. M. Baird and D. S. Smith), 1476
Reversal by Visible Light : Effect of Ultra-Violet Radiation on the Respiration-Rates of Tobacco Leaves, and its (Dr P C. Owen), 610
Reverse : Microscopy in, *review* by Dr. R. Barer, 622
Reversible Inhibitor of Spermatozoan Metabolism : Carbon Dioxide as a (Prof. G. W. Salisbury and N. L. VanDemark), 989
Reynaud, J. : Protein Structure and Biological Activity, 834
Reynolds, P., and Allen, J E : Ionization Phenomena in Gases (Measurements of Electron- and Ion-Temperature), 793
Rhees, R , and others (edited by) : Remarks on the Foundations of Mathematics (Ludwig Wittgenstein), translated by G. E. M. Anscombe, *review* by F. I. G. Rawlins, 399
Rheology : Third International Congress on, 1172
Rheology of Disperse Systems (British Society of Rheology Conference on), 363, 957
Rheology of Elastomers (British Society of Rheology Conference on), 75
Rheology, British Society of : Conference on Rheology of Elastomers, 75
  Conference on the Rheology of Disperse Systems, 363, 957
  Election of Officers for 1957-58, 838
Rhizosphere Phenomenon : Fungistasis as a Factor in the (R. M. Jackson), 96
Rhodophyceen : Die Gattungen der (H. Kylin), 112
Rhodopsin Concentration in Normal Human Beings and one Totally Colour Blind : Relation of Size of Electroretinogram to (Dr. V. Elenius and Dr J. Heck), 810
Rhynchosciara angelae : Autoradiography of Polytene Chromosomes of, at Different Stages of Larval Development (A. Ficq and C. Pavan), 983
Rhynie Chert : Germinating Spores in the (Dr. A. G Lyon), 1219
Rhythms : Biological (Society for Biological Rhythms Conference on), 1100
Rhythms (Biological), Society for : Conference on Biological Rhythms, 1100
Ribonuclease Activity and Ribonucleic Acid Content : Relation between (L. Ledoux, A. Pileri, F. Vanderhaeghe and S. Brändli), 1048
Ribonucleic Acid Content : Relation between Ribonuclease Activity and (L. Ledoux, A. Pileri, F Vanderhaeghe and S. Brändli), 1048
Ribonucleic Acid in Tumour Cells : Distribution of, during Mitosis (Dr. Robert Love), 1338
Rice, Edward G., and others : Enhancement of Vitamin B_{12} Absorption by Substances other than Intrinsic Factor, 1401
Rice, Dr. F A. H., and Levine, Dr. D. : Initiation and Growth of Explosion in Solids (Studies on the Oxidation induced by Ultrasonic Radiation on a Solid System of Lauryl Aldehyde and Potassium Chlorate), 74
Rice, Tamara Talbot : The Scythians, *review* by M. C. Burkitt, 1310
Rice : Control of Flowering in, by Plant-Growth Substances (Dr. G. Misra and G. Sahu), 816
Rice Fields (Flooded) : Chemical Examination of the Water of (R. Vámos), 1484
Richards, R. E , and others : At the Second International Conference on Coal Science (Interpretation of Nuclear Magnetic Resonance Measurements), 418
Richardson, D. E., and Doling, D. A. : Potato Blight and Leaf-Roll Virus, 866
Richardson, Prof. E. G. : Elected president for 1957-58 of the British Society of Rheology, 838
  Relaxation Spectrometry, *review* by Dr. P. Feltham, 1269
Richardson, Dr. F. D. : Appointed to the chair of extraction metallurgy in the Imperial College of Science and Technology, 18 ; work of, 18
Richardson, J. E. : Appointed superintendent of Crown Lands and Surveys, Hong Kong, 1454
Richardson, Dr. S. D. : Tree Physiology (Root-Growth), 77
Richdale, L. E. : A Population Study of Penguins, *review* by Dr. L. Harrison Matthews, 3
Richmond, A. : Awarded a Research Scholarship by the Gas Council, 530
Richmond, D. V. (Somers, E , and) : Defence Mechanism of Plants against Fungi—Sorption of Copper from Burgundy Mixture by Leaves, 798
Richter, C.-P., et autres : l'Instinct dans le Comportement des Animaux et de l'Homme, *review* by Dr. P. T. Haskell, 518
Rickaby, H. C. : Elected president for 1957-58 of Section IV (Geological Sciences) of the Royal Society of Canada, 267
Ricketts, T S., and Elgin, D.C. : Natural Gas in Scotland, 1444
Rickettsial Infections : Latency and Masking in Viral and (University of Wisconsin, the Rockefeller Foundation and the Wisconsin Alumni Research Foundation Symposium on), 788
Rideal, Sir Eric : *Obituary* of Dr. Irving Langmuir, 581
Rider, N. E. : Evaporation from Grass and Vegetables, 20
Riemann, Dr. H : Quality Control of Food (Practical Application of Statistics to the Bacteriological Control of Canned Meats), 1326
Riggenbach, A. : *Fomes lignosus*, a Pyrimidine-deficient Fungus, 43
Right-Ventricle Pressures and Heart-Rate in Diving Birds (Einar Eliassen), 512
Rights of the Individual and the Needs of Development : Amenities, 819
Rigour in Greek Science : The Striving for (Prof. C. Lanczos), 843
Riley, G. A. : The Abyssal Circulation of the Ocean, 733
Riley, Dr. Ralph, and Chapman, Victor : Chromosomes of the Potato Root Eelworm, 662
Riley, R. F., and others : Bibliography for 1953 and 1954 of Syntheses of Compounds containing Carbon Isotopes, 636
Rimington, Prof. C., and others : Congenital Porphyria in Bovines—First Living Cases in Britain, 230
Ring, J. : Interference Spectroscopy, 956
Rings and Satellites of Saturn, 837
Ringspot Virus (Beet) : Soil Transmission of, to Peach (*Prunus persica*), (Dr B. D. Harrison), 1055
Ringtail : Effect of Relative Humidity on Rat Breeding and (Leif Rein Njaa, Finn Utne and Olaf R Braekkan), 290
Ripley, G. W , and others : A Lattice Distortion of Alkali Chloride Crystals in the presence of Nucleoprotein Microfibrils, 696
Ripper, Dr. W. E. (Bergold, Dr G H., and) : The Polyhedral Virus of *Heliothis armigera* (Hbn) (Lepidoptera : Noctuidae), 764
Rippere, R. E : Gas Chromatography (Use in the Study of the Hydrogenation Products of Benzene), 841
Risk and Gambling, the Study of Subjective Probability (Prof. John Cohen and Mark Hansel), *review* by R. L. Gregory, 158
Rissa tridactyla tridactyla (L.) : A New Species of Coccidium (*Eimeria rissae* n. sp. Eimeriidae, *Sporozoa*) from the Kittiwake (Dr. E. J. L. Soulsby and A. R. Jennings), 1057
Rist Prizes of the Société Française de Métallurgie presented to G. Pomey and A. Gueussier, 219
Ritchie, Prof. James : Elected president for 1957-58 of the Royal Society of Edinburgh, 1025
Ritson, Prof. J. A. S. : *Obituary* by E. J Pryor, 1094
Rivers, C. F. (Smith, Dr. Kenneth M., and) : The Polyhedral Virus of *Heliothis armigera* (Hbn.), 928
Rivers : Lamprey Distribution in Streams and (Dr. E. W. Baxter), 1145
Rix, P. : Appointed geologist, Kenya, 1098
Rizza, Dr. C., and Walker, Dr. W. : Inactivation of Antihaemophilic Globulin by Thrombin, 143
Roach, A. G. (Egerton, Dr. G. S., and) : Photochemistry of Polymer Films, 189
  Photochemical Stability of Dyes in the Solid State, 1349
Roach (*Rutilus rutilus*) : Relation between the Ultimate Upper Lethal Temperature and the Temperature-range for Good Health in the (Dr. A. W. Cocking), 661
Road Research 1956—the Report of the Road Research Board with the Report of the Director of Road Research, 588
Road Research Board : Report for 1956, with the Report of the Director of Road Research, 588
Roads in Britain : Research on (T. M Charlton), 588
Roads (Roman), in Britain (Ivan D. Margary), Vol. 2, North of the Fosse Way—Bristol Channel (including Wales and Scotland), *review* by C. W. Phillips, 1256
Roberts, D. B. : Appointed irrigation engineer, Agricultural Department, Northern Nigeria, 1454
Roberts, D. H., and others : Effect of Oxygen on the Carrier Life-time in Silicon, 665
Roberts, Henry R., and Kolar, Michael G : A Rapid Procedure for the Separation of Amino-Acids on Paper Chromatograms, 384
Roberts, Henry R , and others : Degradation of Biologically Synthesized Lactose labelled with Carbon-14, 915
Roberts, J A., and others . Occurrence of the Meta-stable Omega Phase in Zirconium Alloys, 1406
Roberts, J E. : Rheology of Disperse Systems (Dilatant and Thixotropic Pastes), 958
Roberts, J. P. (Allsopp, H. J., and) : Excess Zinc in Zinc Oxide, 603
Roberts, Dr. L. W , and others : A Quantitative Comparison of Sulphydryl Content and Formazan in the Tissues of the Pea Radicle, 997
Robertson, Prof. A., and others : Recent Advances in the Chemistry of Terpenoid Compounds (Structure of Rosono—and Rosenono—Lactones), 471
Robertson, A. A , and others : Fundamental Aspects of Fibres and their Treatment for Papermaking (Hydrodynamic Behaviour of Papermaking Fibres), 1177
Robertson, H. A. : Trace Elements in Soils, Plants and Animals (Copper Nutrition in Ruminants), 25
Robertson, H. A., and Broome, A. W. J. : Trace Elements in Soils, Plants and Animals (Results of Injections of Thyroxine and Thiouracil in Sheep), 24
Robertson, I. A. D. : Appointed entomologist, Tanganyika, 688
Robertson, J. B. : Appointed fisheries officer, Tanganyika, 1098
Robertson, Dr. P. A., and Hawker, Dr. R. W. : A Second Oxytocin in the Hypothalamus, 343
Robertson, Dr. P. A. (Johnson, Dr. Edward A., and) : Effect of Acetylcholine and Quinidine on Atrial Cellular Potentials, 1483
Robertson, Dr. W. G. P., and Hammond, J M. : High Polymer, Colloid and Surface Chemistry (Synthesis of Polymers consisting of a Polyisobutene backbone bearing branches of a Polymethyl Acrylate), 960
Robertson, Dr. W. G. P., and Shepherd, D. J. : High Polymer, Colloid and Surface Chemistry (Cross-linking Efficiency of Monomers in Polyester Resins), 960
Robertson, Dr. W. G. P., and Urwin, Dr. J. R. : High Polymer, Colloid and Surface Chemistry, 959
Robins, A. B., and others : Molecular Weights and Physical Properties of Deoxyribonucleic Acid, 1340

Robinson, Ann E (Beckett, Dr. A H., and) : Site of Reduction of Nitrofurazone by Bacteria, 1206
Robinson, Dr Conmar, and Ward, J. G : Liquid-Crystalline Structures in Polypeptides, 1183
Robinson, Dr J. T. : Occurrence of Stone Artefacts with *Australopithecus* at Sterkfontein, Part I, 521
Robinson, Sir Robert Biogenesis of Natural Products (Biogenesis of Structural Relations—the Organic Chemist's Contribution), 679
Robinson, Roy : Partial Albinism in the Syrian Hamster, 443
Robinson, R. J., and Coxon, Dr. R V. : Radioactivity of Blood Carbon Dioxide in Animals oxidizing Glucose labelled with Carbon-14 and other Labelled Substances, 1279
Robson, A. E : Ionization Phenomena in Gases (The Evaporating Cathode and the Tanberg Effect), 792
Robson, J. M., and Jackson, D. Studies on Fertility (Effects on Pregnancy of certain Antimetabolites and Nucleotoxic Compounds), 227
Roche, M., and others : Isotopic Tracer Method for Measurement of Iron Lost into and Re-absorbed from Gastro-intestinal Bleeding Lesions, 1278
Rochester Conference : Proceedings of the Sixth Annual (1956)—High Energy Nuclear Physics (compiled and edited by J Ballam, V. L. Fitch, T Fulton, K Huang, R R. Rau and S B. Treiman), *review* by Sir John Cockcroft, 303
Rockefeller Foundation, New York : Grant of 121,000 dollars to King's College, London, for biophysics research, 891
  Grant of 9,500 dollars to the Macaulay Institute for Soil Research, for the development of spectrochemical methods of analysis, 1098
  Annual Report for 1956, 1103
Rockefeller Foundation, New York, and others : Symposium on Latency and Masking in Viral and Rickettsial Infections, 788
Rockefeller Institute for Medical Research, New York : Appointment of Dr. Fritz A. Lippmann as a member and professor, 270
  Publication of the *Rockefeller Institute Quarterly*, 735
Rockefeller Travelling Fellowships in Medicine (Medical Research Council Awards for 1957-58), 315
Rocket of the First Artificial Earth Satellite : End of the, 1392
Rocket of the First Earth Satellite, 944
Rocket Experiment : High-Altitude, 951
Rocket Observation of X-Ray Emission in a Solar Flare (Dr. J. W Warwick and Dr. H. Zirin), 500 ; (Dr. T A Chubb, Dr. H. Friedman, R. A. Kreplin and J. E. Kupperian, Jun.), 501
Rocket Testing Ranges, 1392
Rocket (Carrier) : Radar Observations of the First Russian Earth Satellite and (Staff of the Jodrell Bank Experimental Station, University of Manchester), 941
Rockets (British 'Skylark') : Instrumentation of, 1097
Rocking Microtomes : Ultra-thin Serial Sectioning with (Arwyn Charles), 1302
Rocks A Simple Method of Determining Ultrasonic Velocities in (K. Subbarao and Dr B Ramachandra Rao), 978
Roddie, Dr. I. C. : Appointed lecturer in physiology at Queen's University, Belfast, 953
Rodney Stoke Woods Nature Reserve, 78
Rodriguez, D. : Awarded a Spanish Fellowship for 1957-58 by the Ramsay Memorial Trust, 316
Rogers, Dr G. T. Initiation and Growth of Explosion in Solids, 73
Rogers, Dr G. T (McLaren, Dr. A. C., and) Initiation and Growth of Explosion in Solids (Initiation by Light), 74
Rogers, J. (Matijević, E., and) : Surface Properties of Sodium Octyl Sulphate in Saturated Salt Solutions, 560
Rogerson, A : Appointed senior scientific officer, East African Veterinary Research Organization, 21
Roig, J. : Interference Spectroscopy, 955
Role of Agriculture in the British Economy (Sir James Turner), 486
Role of Cations in Phage Adsorption to Sensitive Bacteria (J. Beumer, J Dirkx and M P. Beumer-Jochmans), 83
Role of Damaged Starch in the Evaluation of Wheat Quality (L. H. Bird), 815
Role of Structural Degradation in the Loss of Serological Activity of Ovalbumin Irradiated with Gamma-Rays (Hugo Fricke, Charles A. Leone and Wendell Landmann), 1423
Rollason, Prof E. C. : Wetting and Spreading of Liquid Metals on Solid Metal Surfaces, 1156
Roman Roads in Britain (Ivan D. Margary), Vol. 2, North of the Fosse Way—Bristol Channel (including Wales and Scotland), *review* by C. W. Phillips, 1256
Romney, D. H. : Appointed senior scientific officer, British Honduras, 220
Romney Rams and Wethers : Photoperiodicity and Wool Growth in (Dr. A B Wildman), 296, *erratum*, 1098
Rondle, C. J. M (MacLennan, A P, and) : *Pasteurella septica*—the Occurrence of Type-Specific Polysaccharides containing Aldoheptose Sugars, 1045
Rooke, H S. : Reports on the Progress of Applied Chemistry, Vol. 40, 1955 (Society of Chemical Industry), *review* by Prof. J. R. Partington, 59
Root Cells of *Pisum* : Intracellular Incorporation of Iron-59 into the (J. V. Possingham and R. Brown), 653
Root Nodules of *Casuarina* (G. Bond), 1238
Roots (Broad Bean) : Dependence on Oxygen and Temperature of the Sensitivity of, to γ-Radiation (G. J Neary), 248
Rose, D. J. : Ionization Phenomena in Gases (Secondary Mechanisms of the Glow Discharge), 792
Rose, Dr. J H, and others : The Sheep Lungworm *Protostrongylus brevispiculum* in Great Britain, 1372
Rosenberg, Ellis E. : Teratogenic Effects of Beta-Amino-Propionitrile in the Chick Embryo, 706
Rosenbluth, M. : Ionization Phenomena in Gases (Stability of the Pinched Discharge), 794
Rosoff, Dr. Betty, and others : Excretion of Yttrium and Lanthanum Chelates of *Cyclohexane* 1,2-*Trans* Diamine Tetraacetic Acid and Diethylenetriamine Pentaacetic Acid in Man, 919
Rosoff, Morton, and others : Anion Exchange Chromatography and Molecular Size of Deoxyribonucleic Acid, 1355
Ross, Prof. Alan S. C (Allanson, J. T., and) : Communication Theory, *review*, 255
Ross, D. B. : Awarded a Research Training Scholarship for 1957-58 by the Animal Health Trust, 412
Ross, Dr. D. M. : Responses of *Cerianthus* to Stimulation, 1368
Ross, Dr. D. M., and others : Identification and Distribution of 5-Hydroxytryptamine in a Sea Anemone, 658
Ross, K. B. : Some Reflexions on the Atomic Energy Industry (Anniversary Lecture of the Society of Leather Trades' Chemists), 270
Rossby, Prof. Carl Gustaf : Awarded posthumously the Annual Prize of the World Meteorological Organization, 787
  Obituary by Prof P. A Sheppard, 1166
Rossi, Prof. Bruno : Optics, *review*, 1269
Rossi, Dr. B, and others An Experiment on Air Showers produced by High-Energy Cosmic Rays, 353, 406
Rossini, Frederick D. (edited by) : Experimental Thermochemistry—Measurement of Heats of Reaction, *review* by Dr. E. F. G Herington, 57
Rotating Fluids : Planetary Atmospheres and Convection in (Royal Meteorological Society and the Royal Astronomical Society Joint Symposium on), 1455
Rotation (Optical), and Infra-Red Spectra of some Polypeptide and Protein Films (Dr A. Elliott, W E. Hanby and B R. Malcolm), 1340
Rotational Analysis of the Tantalum Oxide Bands (D. Premaswarup and Dr. R. F. Barrow), 602
Rotblat, Prof. J (Sutton, Dr. H. C., and) : Dose-Rate Effects in Radiation-induced Chemical Reactions, 1332
Rothamsted Experimental Station : Retirement of Dr. H. G Thornton as head of the Soil Microbiology Department, 634
  Appointment of Dr. P. S. Nutman as head of the Soil Microbiology Department, 634
Rotherham, L. : *Obituary* of James Kendall, 684
Rothlin, Prof. E. : Elected president of the International Collegium for Neuro-Psycho-Pharmacology, 1324
Rothman, Prof. S. : Biology of Hair Growth, 592
Roughton, Prof. F. J. W. : Recent Advances in Gelatin and Glue Research, 690
Roulston, W. J., and others : Specific DDT-Resistance in Houseflies, 1132
Rous Sarcoma : Internal Structure of the Virus-like Particles associated with the, and their Presence in other Neoplastic and Normal Chicken Tissues (Prof. Ch. Oberling, W. Bernhard and Ph. Vigier), 386
Rous Sarcoma Virus : Development of Multiple Cysts and of Haemorrhagic Affections of Internal Organs in Albino Rats treated during the Embryonic or New-born Period with (G. J. Svey-Moldavsky), 1299
Route for Intravenous Injection in the Albino Rat (Kenneth A Pearce), 709
Routine Toxoiding with Formalin : Loss of Immunizing Power of Staphylococcal Toxin during (Dr Stephen Fisher), 1479
Roux, Dr David G. : Some Recent Advances in the Identification of Leuco-Anthocyanins and the Chemistry of Condensed Tannins, 973
Rowan, Prof. William : *Obituary* by Prof W. Ray Salt, 463
Rowe, Dr J S. : Appointed to co-ordinate all ecological studies carried out by the forest research division of the Forestry Branch of the Canadian Department of Northern Affairs and National Resources, 270
Rowe, R D H : Appointed assistant conservator of forests, Kenya, 21
Rowlands, Dr I. W Endocrinological Problems in Agriculture, 576
Rowley, Dr D. : Non-specific Immunity (Immunity produced in Mice by Injection of Cell Walls of Gram-negative Bacteria against subsequent Infections by other Gram-negative Organisms), 641
Roy, A. B. : Biochemistry of Sulphur (Metabolism of Steroid Sulphates), 466
Roy, A. B, and Mukherjee, M K : A New Type of Nitrogen-fixing Bacterium, 236
Roy, Dr J H. B. : The Infant Animal (The Nutrition of the Early Weaned Calf), 682
Royal Academy of Belgium : Paul Fourmarier Prize for 1947-56 awarded to Prof. Arthur Holmes, 316
Royal Aeronautical Society and the United States Institute of the Aeronautical Sciences : Sixth Anglo-American Aeronautical Conference, 413
Royal Agricultural Society of England : Research Medal, 1171
Royal Aircraft Establishment, Bedford (L H. G Sterne), 775
Royal Aircraft Establishment : Appointment of P A Hufton as head of the Bedford Divisions, Aerodynamics Department, 787, 1095
  Promotion of Dr. D Kuchemann to deputy chief scientific officer and appointment as head of the Supersonics Division of the Aerodynamics Department, 787, 1096
  Promotion of R. W. Pye to deputy chief scientific officer as head of the Trials Department, 1095
Royal Aircraft Establishment (Staff of the) : Observations on the Orbit of the First Russian Earth Satellite, 937, *erratum*, 1028
Royal Astronomical Society (Royal Meteorological Society and the) : Joint Symposium on Planetary Atmospheres and Convection in Rotating Fluids, 1455
Royal Australian Chemical Institute : Election of Dr. I. W. Wark as president for 1957-58, 836
  H. G. Smith Memorial Medal awarded to Dr K. L Sutherland, 1394
Royal Australian Chemical Institute (South Australian Branch) : Discussion on High Polymer, Colloid and Surface Chemistry, 959
Royal Botanic Gardens, Kew : Report for 1956 (Prof C W. Wardlaw), 370
Royal College of Physicians of London : Movement of the Heart and Blood in Animals (William Harvey), translated from the original Latin by Prof. Kenneth J. Franklin, *review* by Prof. F J. Cole, 449
Royal College of Surgeons of England : Golden Jubilee Celebration, 893
Royal Commission on the Law relating to Mental Illness and Mental Deficiency : Report of the (1954-57), 253
Royal Greenwich Observatory : Report of the Astronomer Royal for 1956-57, 586
Royal Institute of Chemistry : Dalton Lecture (Dr. J Bronowski), 636
  Dalton Exhibition, 637
Royal Institute of Chemistry, and others : Joint Symposium on the Newer Metals, 637
Royal Institute of Public Administration : Vitality in Administration (Herbert Morrison, Basil Smallpeice, Sir Alexander Fleck, Sir Wilfred Neden, A. D Bonham-Carter and Major-General G N. Russell), 153
  The Making of an Administrator (edited by A. Dunsire), 153
Royal Institution : Christmas Lectures, 1239
Royal Medals for 1957 of the Royal Society awarded to Prof. W. V. D. Hodge and Prof. F. G. Gregory, 1095, 1231

Royal Meteorological Society : Election of Officers for 1957-58, 21
  Memorial to G. J. Symons, 313
  Climatological Station at Camden Square, London, opened by Dr. R. C. Sutcliffe, 314
  Discussion on Cloud Physics, 573
  Discussion on Hill Climate, 574
Royal Meteorological Society and the Royal Astronomical Society : Joint Symposium on Planetary Atmospheres and Convection in Rotating Fluids, 1453
Royal Military College of Science, Shrivenham : Dr. William Ralston seconded as scientific and technical adviser to the Commonwealth Relations Office, with special responsibility for the scientific problems of the Colombo Plan, 172
  Appointment of Dr. Arthur Charlesby as professor of physics, 1026
  Appointment of Prof. A. D. S. Carter as professor of mechanical engineering, 1026
  Appointment of Prof. Alan Lee as professor of electrical engineering (radar and telecommunications), 1026
  Appointment of Prof. J. Diamond, Prof. M. H. L. Pryce and R. P. Bell to the Advisory Council, 1026
Royal Photographic Society · Exhibition of Nature Photography, 892
Royal Photographic Society (Scientific and Technical Group), in collaboration with the Department of Scientific and Industrial Research : Conference on Industrial High-Speed Photography, 1394
Royal Radar Establishment, Malvern : International Symposium on Electronic Components, 531
  Further Radio Observations of the First Satellite, 944
Royal Radar Establishment, Malvern (Staff of the) : The 45-ft. Radio Telescope at the Royal Radar Establishment, Malvern, 1225
Royal Society of Arts : Conference on Capital for Scientific Development, 307
  Awards of Endowed Prizes for 1957, 891
Royal Society of Canada : Seventy-fifth Anniversary Meeting (Prof. W. H. Watson), 259
  Symposium on Our Debt to the Future, 259
  Honorary membership accepted by Prince Philip, 260
  Section III (Mathematical, Chemical and Physical Sciences) : Symposium on Symmetry, 267
  Section IV (Geological Sciences) : Symposium on Hydrology, 267
  Section V (Biological Sciences) : Presidential Address, Research in the Biosciences, a Mid-Century Perspective (W. H. Cook), 267
  Election of Officers for 1957-58, 267
Royal Society of Edinburgh : Election of Honorary Fellows, 69
  Award of a Robert Cormack Bequest Fellowship in Astronomy to Miss Patricia R. R. Leslie, 122
  Election of Officers for 1957-58, 1025
Royal Society of London : Discussion on Geophysical Investigations made in the Atlantic from R. R. S. *Discovery II* in 1956, 10
  Discussion on Initiation and Growth of Explosion in Solids, 73
  Appointment of Prof. E. N. da C. Andrade to deliver the Rutherford Memorial Lecture for 1957, 119
  Appointment of Prof. P. M. S. Blackett to deliver the Rutherford Memorial Lecture for 1958, 119
  Appointment of S. L. Surange as Rutherford Scholar at the Royal Society Mond Laboratory, Cambridge, 119
  Appointment of Dr. P. C. Caldwell to an Alan Johnston, Lawrence and Moseley Research Fellowship, 119
  Appointment of Dr. M. J. R. Dawkins to the Stothert Research Fellowship, 119
  Philosophical Transactions of the, Series A, Mathematical and Physical Sciences, No. 966, The Statistical Analysis of a Random, Moving Surface (Dr. M. S. Longuet-Higgins), 228
  The United Kingdom Contribution to the International Geophysical Year, 1957-58, *review* by G. A. Bull, 569
  Discussion on Observations of the Russian Artificial Earth Satellite and their Analysis, 953
  Medal Awards, 1025, 1095, 1231
  Royal Medals for 1957 awarded to Prof. W. V. D. Hodge and Prof. F. G. Gregory, 1095, 1231
  Award of Medals for 1957, 1231
  Anniversary Address (Sir Cyril Hinshelwood), 1233
  Grants for Travelling Expenses, 1172
  Election of Officers, 1237
Royal Society Antarctic Expedition for the International Geophysical Year : Awards of the Polar Medal to members of the, 18
  Appointment of Joseph MacDowall as leader at Royal Society Base, Halley Bay, 1026
Royal Society and Nuffield Foundation : Awards under the Commonwealth Bursaries Scheme, 119
  Appointment of Dr. F. V. Morley as liaison officer to the joint committee administering grants to assist learned scientific journals, 465
Royal Society and the Science Masters' Association : Formation of a Joint Committee to consider Scientific Research in Schools, 1393
Royal Society of Medicine : First Sherrington Memorial Lecture (Lord Adrian), 1028
Royal Society for the Prevention of Cruelty to Animals : Pamphlet on Cleansing of Oil-polluted Birds, 1453
Royal Society of South Africa : Elections, 1025
Royal Statistical Society (Industrial Applications Section) : Conference on Production Control, 1239
Rubber : Visual Deficiency Symptoms in, 362
Rubber (Soft Vulcanized), subjected to Tensile Loads : Internal Flaws in Bonded Cylinders of (A. N. Gent and P. B. Lindley), 912
Rubber Industry : Natural—Research and Development (Prof. G. Gee), 743
Rubber Producers' Council of the Federation of Malaya : Report of the Advisory Committee enquiring into Production, Development and Consumption Research in the Natural Rubber Industry, 743
Rubber Producers' Research Association, British : Nineteenth Annual Report (1956), 962
Rubidium-86 : Transport of Potassium-42 and, by Kidney Cortex Slices—the Effect of varied Concentration Gradients (A. Kleinzeller and Dr. J. H. Cort), 1124
Rubinowicz, Prof. A. : Thomas Young and the Theory of Diffraction, 160
Rubinstein, Dr. Herbert M. : Coagulant Action of Proteolytic Enzymes, 1202
Rudebeck, Gustaf, and others (edited by) : South African Animal Life—Results of the Lund University Expedition in 1950-1951, Vols. 1-3, *review* by Prof. O. Lowenstein, 56
Ruegg, J. C., and others : Structure of Molluscan Tropomyosin, 1134
Rugby School Natural History Society : Report, 276
Ruiz, J. J., and others : Combined Light and Velocity Measurements of the Variable Star 12 Lacertae, 1112
Rumen Micro-organisms : Utilization of Carbohydrate Metabolites by (the late Dr. A. John G. Barnett and M. G. C. Dow), 548
Rumford, Dr. F. : Chemical Engineering Education (New Trends in Teaching), 126
Runcorn, Prof. S. K., and others : The Geomagnetic Field in Upper Triassic Times in the United States, 1186
Rural England, Council for the Preservation of : Eighteenth National Conference for the Preservation of the Countryside (Rural Problems of the Moment), 531
  Work of the, 636
Rural Problems of the Moment (Eighteenth National Conference for the Preservation of the Countryside), (Council for the Preservation of Rural England), 531
Rushton, W. A. H. · Visual Problems of Colour, 1395
Russell, Earl : Awarded the Kalinga Prize for 1957, 1454
Russell, E. W. : Polyesters and their Applications, *review*, 774
Russell, F. S. : Research in Marine Biology (New Species of Deep-water Scyphomedusan, *Atolla vanhoeffeni*), 746
Russell, Dr. G. A. : Solvent Effects and Reaction Mechanism, 535
Russell, Major-General G. N., and others : Vitality in Administration, 153
Russell, Sir John : The Essayist of the British Countryside, *review*, 1257
Russell, Dr. R. Scott : Radioisotopes in Scientific Research—Unesco Conference (Biological Sciences Sessions), 1030
Russell, Dr. R. Scott, and Milbourn, G. M. : Rate of Entry of Radioactive Strontium into Plants from Soil, 322
Russell, Dr. R. Scott, and others : Radiosensitivity of Salt Uptake in Plants, 556
Russia, the Atom and the West (Prof. George F. Kennan), 893
Russian Artificial Earth Satellite : Observations of the, and their Analysis (Royal Society Discussion on), 953
  Orbit of the Second, 1026
Russian Conference on Low-Temperature Physics, 460, *erratum*, 893
Russian Earth Satellite : Observations on the Orbit of the First (Staff of the Royal Aircraft Establishment, Farnborough), 937, *erratum*, 1028
  Radio Observations of the (Staff of the Mullard Radio Astronomy Observatory, Cambridge), 879
Russian Earth Satellite and Carrier Rocket : Radar Observations of the First (Staff of the Jodrell Bank Experimental Station, University of Manchester), 941
Russian Earth Satellites and the International Geophysical Year, 1027
Russian Medical and Biological Journals : Publication of English Translations of (Pergamon Institute), 466
Russian Satellite : Radio Observations on the (Radio and Telecommunication Section of the Institution of Electrical Engineers Discussion on), 953
Russian Scientific Literature : Availability of, 1451
Russian Scientific and Technological Literature (Department of Scientific and Industrial Research Lending Library Unit collection of), 1169
Russian—English Glossary of Nuclear Physics and Engineering (Consultants Bureau, Inc.), *review* by J. B. Sykes, 569
Rust-resistance : Transference of, to Bread Wheats (—. Elliott), 736
Rust (Leaf) : Effect of, on Cereal Forage (A. F. Greenall), 1000
Rusting Iron : Degradation of Cellulosic Fibres in Contact with (W. A. Bell and Jean M. Gibson), 1065
Rutherford, P. P. : Appointed Polymer Corporation Research Fellow at the University College of North Staffordshire, 688
Rutherford High Energy Laboratory of the National Institute for Research in Nuclear Science, 1391
  Appointment of Dr. T. G. Pickavance as first director, 1391
Rutherford Memorial Appointments, 119
Rutilus rutilus : Relation between the Ultimate Upper Lethal Temperature and the Temperature-range for Good Health in the Roach (Dr. A. W. Cocking), 661
Ruyer, R., et autres : l'Instinct dans le Comportement des Animaux et de l'Homme, *review* by Dr. P. T. Haskell, 518
Ryan, N. E., and others : Some Properties of Chromium deposited from an Electrolyte containing Fluoride, 1406
Rybalkina, Dr. A. V., and Kononenko, Dr. E. V. : Methods of Studying the Microbiology of Soils (A Method to Assess the Total Activity of the Soil Microflora), 591
Ryder, Dr. M. L. : Biology of Hair Growth (Nutritional Problems of the Growing Hair), 594
Ryle, M. The Mullard Radio Astronomy Observatory, Cambridge, 110

SACCHARIFICATION of Potato Mashes by means of Fungal Preparations (K. Beran, M. Burger and S. Zelenka), 362
Saddle Oyster : *Enigmonia aenigmatica* Sowerby, a Motile Anomiid (Prof. C. M. Yonge), 765
Safety in the Chemical Industry (Chemical Engineering Group and the London Section of the Society of Chemical Industry Symposium on), 220, 1397
Safety and Health in Welding . Course on (Institute of Welding), 172
Saade, J., and others : Combined Light and Velocity Measurements of the Variable Star 12 Lacertae, 1112
Sahasrabudhe, M. B., and others : Influence of Post-Irradiation Administration of Methionine on the Levels of Deoxyribonucleic Acid in Bone Marrow, Spleen and Liver of Rats, 193
  Choline-Oxidase Activity of Host-Livers of Tumour-bearing Animals, 1128
Sahu, G. (Misra, Dr. G., and) : Control of Flowering in Rice by Plant-Growth Substances, 816
Saad, Anwar (Newton, Dr. J. D., and) : Molybdenum Deficiency in Latosols of Java, 1485
Saint-Guily, B. : The Abyssal Circulation of the Ocean, 734
Saito, H., and others : Morphological Changes of Tubercle Bacilli caused by Staining Procedures, 42

Saito, Prof. Nobufusa, and Sekine, Tatsuya : Anion Exchange Behaviour of Yttrium, 753
Salaman, Dr. M. H., and others : The Non-Toxicity of Maleic Hydrazide for Mammalian Tissues, 62
Salary Policy in Britain : National Wage and (Dr. Elliott Jaques), 525
Salisbury, Prof. G. W., and VanDemark, N. L. : Carbon Dioxide as a Reversible Inhibitor of Spermatozoan Metabolism, 989
Salivary Poison in the Marine Gastropod *Neptunea antiqua* : An Acetylcholine-like (Dr. Ragnar Fange), 196
Salivary-type Chromosomes which exhibit 'Puffs' : Incorporation of Phosphorus-32 into (Julian D. Gross), 440
Salmon : Biology of the (British Association for the Advancement of Science, Section D (Zoology), Symposium on), 789
Salt, Prof. W. Ray : *Obituary* of Prof. William Rowan, 463
Salt : An Effect of *p*H on the Uptake of, by Plant Cells (R. G. Hurd and Dr. J. F. Sutcliffe), 233
Salt (Sodium), of the Directly Reacting Bile Pigment (Dr. Ed. Talafant), 1051
Salt Solutions (Saturated) : Surface Properties of Sodium Octyl Sulphate in (E. Matijević and J. Rogers), 560
Salt Uptake in Plants : Radiosensitivity of (D. A. Barber, Dr. G. J. Neary and Dr. R. Scott Russell), 556
Salt Water : Fresh Water from (D. Neville-Jones), 171
Salter, J. M., and others : Calorigenic Action of Glucagon, 1124
Salter, Dr. P. J. : Blindness in Early Summer Cauliflower, 1056
Salters' Company : Election of Officers for 1957-58, 21
Salton, Dr. M. R. J. : Cell-Wall Amino-Acids and Amino-Sugars 338
Salts : Activation of Polynucleotide Phosphorylase by (Roland F. Beers, jun.), 246
Salts (Lithium) : Toxicity of, to Keratin-digesting Insect Larvae (Dr. J. R. McPhee), 1001
Salvini, Prof. Giorgio : *Obituary* of Prof. Antonino Mura, 1167
Samborski, Dr. D. J., and others : Effect of Benzimidazole on Detached Wheat Leaves, 1294
Sampler : A Scientific (edited by Raymond Stevens, Howard F. Hamacher and Alan A. Smith), *review* by T. H. Hawkins, 209
Sanatorium of Azounieh, Lebanon : Grant of £20,000 from the Calouste Gulbenkian Foundation, Lisbon, for building a Calouste Gulbenkian Research Centre for Chest Diseases, to serve the Middle East, £10,000 for laboratory equipment, and £6,000 towards the running expenses, 1027
Sanders, Dr. J. V., and Sherwood, R. G. : High Polymer, Colloid and Surface Chemistry (Thermodynamics of Mixtures of Silicones and Benzene), 960
Sandler, S., and others : Oxidation of Pentane in Mixtures with Air and the Negative Temperature Coefficient of Reaction, 335
Sankey, John : The European Badger, 421
Sanyal, Dr. R. K., and West, Dr. G. B. : 5-Hydroxytryptamine and Anaphylactic Shock, 1417
Sap (Bleeding), of Pea Plants : Homoserine in (Dr. Janny A. Bakhuis), 713
Saponins (Triterpenoidal) : Fractionation of Isolated Lucerne and other (Dr. C. B. Coulson), 1297
Sarawak Museum : Grant of £5,000 from the Calouste Gulbenkian Foundation, Lisbon, for the excavation of the great cave of Niah in Subis Mountain, 1027
Sarcocystis sp. in the Red-legged Partridge, *Alectoris rufa*, and the Pheasant, *Phasianus colchicus* (P. A. Clapham), 1294
Sarcoma (Rous) : Internal Structure of the Virus-like Particles associated with the, and their Presence in other Neoplastic and Normal Chicken Tissues (Prof. Ch. Oberling, W. Bernhard and Ph. Vigier), 386
Sarcoma Cells (Yoshida) : Effects of Kinetin on Division of (Yoshito Ogawa, Yukihide Abe and Kenjiroo Fujioka), 985
Sarcoma Virus (Rous) : Development of Multiple Cysts and of Haemorrhagic Affections of Internal Organs in Albino Rats treated during the Embryonic or New-born Period with (G. J. Svet-Moldavsky), 1299
Sarcomycin : Effects of, on the Metabolism of Ehrlich Ascites Sarcinoma Cells (I. J. Bickis, Dr. E. H. Creaser, Prof. J. H. Quastel and Dr. P. G. Scholefield), 1109
Sarma, Prof. P. S. (Viswanathan, L., and) : A Growth Inhibitor of *L. bulgaricus* 09, 1370
Sarma, Y. S. R. K. : Chromosome Numbers in some Members of the Ulotrichales, 46
Satellite : The Artificial Earth, 719, 734
  End of the Rocket of the First Artificial Earth, 1392
  Estimating the Life of a (J. M. C. Scott), 1467
  Life-time of an Artificial Earth (J. A. Fejer), 1413
  Observations at Jodrell Bank of the Artificial Earth, 890
  Observations on the Orbit of the First Russian Earth (Staff of the Royal Aircraft Establishment, Farnborough), 937, *erratum*, 1028
  Observations of the Russian Artificial Earth, and their Analysis (Royal Society Discussion on), 953
  Orbit of the Artificial Earth, 784
  Orbit of the Second Russian Artificial Earth, 1026
  Photograph of the Track of the Artificial Earth, 835
  Radio Observations on the Russian (Radio and Telecommunication Section of the Institution of Electrical Engineers Discussion on), 953
  Radio Observations of the Russian Earth (Staff of the Mullard Radio Astronomy Observatory, Cambridge), 879
  Further Radio Observations of the First (Ivan R. King, Prof. G. C. McVittie, George W. Swenson, jun., and Stanley P. Wyatt, jun.), 943 ; (Norman Lea), 943, *erratum*, 1172 ; (Royal Radar Establishment, Malvern), 944
  Rocket of the First Earth, 944
  The Second Artificial Earth, 931
Satellite and Carrier Rocket : Radar Observations of the First Russian Earth (Staff of the Jodrell Bank Experimental Station, University of Manchester), 941
Satellites : The Effect of the Saturnian Ring upon the Motion of the (Yoshihide Kozai), 837
Satellites (Russian Earth), and the International Geophysical Year, 1027
Satellites of Saturn : The Rings and, 837
Sathyanesan, A. G. : Parasitism in relation to the Pituitary of *Ophicephalus punctatus* and *Barbus stigma*, 98
Sato, Prof. A., and Aso, K. : Kojibiose (2-0-α-D-Glucopyranosyl-D-Glucose)—Isolation and Structure, 984
Saturated Salt Solutions : Surface Properties of Sodium Octyl Sulphate in (E. Matijević and J. Rogers), 560
Saturn : The Rings and Satellites of, 837
Saturnian Ring : The Effect of the, upon the Motion of the Satellites (Yoshihide Kozai), 837
Saturniid Moths infected by a Microsporidian : Abnormal Metamorphosis in (Dr. L. H. Finlayson and W. Ann Walters), 713
Saunders, Dr. D. W. : Rheology of Elastomers (Equilibrium Properties of Rubberlike Materials), 75
Saunders, L. W. (Cosh, T. A., and) : The Application of the Graphite-rod Resistor Furnace to Steel Foundry Practice, 218
Saunders, P. R., and Ward, A. G. : Rheology of Elastomers (Equilibrium Properties of Rubberlike Materials), 75
  Recent Advances in Gelatin and Glue Research (Gel Rigidity), 691
Saunders, Prof. R. L. de C. H. : X-Ray Microscopy of Human Dental Pulp Vessels, 1353
Sauropsid Reptiles : On *Millerosaurus* and the Early History of the (Prof. D. M. S. Watson), 128
Sawkill, Dr. J. : Initiation and Growth of Explosion in Solids, 73
Sawyer, J. S. : Planetary Atmospheres and Convection in Rotating Fluids (Jet Streams in the Earth's Atmosphere), 1454
Sax, Dr. K. : Tree Physiology (Physiology of Reproduction), 78
Saxe, Dr. R. F. : Ion Cyclotron Resonance, 87
Sayce, R. U. : Retirement from the keepership of the Manchester Museum in the University of Manchester, 411 ; work of, 411
Sayers, J. : Ionization Phenomena in Gases (Ionic Reactions in Gases), 791
Scanlan, Dr. J. : Rheology of Elastomers (Equilibrium Properties of Rubber-like Materials), 75
Scarbroite : X-Ray Study of (Dr. W. J. Duffin and Dr. J. Goodyear), 977
Schachter, Dr. M., and others : Identification and Distribution of 5-Hydroxytryptamine in a Sea Anemone, 658
Schapera, Prof. I. : Government and Politics in Tribal Societies, *review* by Dr. A. L. Epstein, 1442
Scheer, Bradley T. (edited by) : Recent Advances in Invertebrate Physiology—a Symposium sponsored by the National Science Foundation, the Tektronix Foundation and the University of Oregon, *review* by Prof. V. B. Wigglesworth, 1309
Scheidegger, Dr. Adrian E. : The Physics of Flow through Porous Media, *review* by Dr. Paul Eisenklam, 1008
Scherb, Dr. F., and others : An Experiment on Air Showers produced by High-Energy Cosmic Rays, 353, 406
Scherber, Floyd I., and others : Suppression of Bubbling in Boiling Refrigerants, 1413
Schevill, William E. (Worthington, L. V., and) : Underwater Sounds heard from Sperm Whales, 291
Schild, Dr. H. O. (Evans, Dr. D. H. L., and) : Mechanism of Contraction of Smooth Muscle by Drugs, 341
Schilder, F. A. : Systematics of Today (Versuch einer genetischen Klassifikation der Varianten bei Bänderschnecken), 741
Schildknecht, Calvin E. (edited by) : Polymer Processes—Chemical Technology of Plastics, Resins, Rubbers, Adhesives and Fibres, *review* by Prof. C. E. H. Bawn, 672
Schuller, K. : Strength of Highly Porous Brittle Materials, 862
Schirmer, H. : Ionization Phenomena in Gases (Calculation of the Electrical Conductivity of a partially Ionized Gas, with special reference to a High-pressure Xenon Discharge), 793
Schistosomes : Possible Occurrence of Strains in Species of (B. Verdcourt), 865
Schlieren Technique : Detection of Inhomogeneities in Transparent Plastic Sheet by a simple (H. H. Allen), 50
Schlesinger, M., and others : Serological Changes Concomitant with the Growth of Mouse Tumours in Pretreated Rats, 185
Schlüter, A., and others : Ionization Phenomena in Gases (Problems of Hydromagnetic Stability), 794
Schmid, Dr. Rudi, and others : A Biochemical Lesion in Congenital, Non-obstructive, Non-haemolytic Jaundice, 1426
Schmiedeberg Award of the German Pharmacological Society given to Dr. E. P. Pick, 890
Schmitz, G. : Ionization Phenomena in Gases (Method of Solving the Energy-balance Equation for a Cylindrical Plasma Channel), 793
Schneider, Rose G., and Haggard, Mary Ellen : A New Haemoglobin Variant exhibiting Anomalous Electrophoretic Behaviour, 1486
Schneirla, T.-C., et autres : l'Instinct dans le Comportement des Animaux et de l'Homme, *review* by Dr. P. T. Haskell, 518
Schnitzerling, H. J., and others : Specific DDT-Resistance in Houseflies, 1132
Schoental, Dr. R. : Isolation of 3·4-9:10-Dibenzopyrene from Coal-Tar, 606
Scholander, Prof. P. F. : Tree Physiology (Cohesion Theory of the Ascent of Sap), 77
Scholarship : Frank Wright (Textile Institute), 738
Scholarship Fund : Dr. Macalister Brew (To be established by the National Association of Mixed Clubs and Girls' Clubs), 314
Scholarship Scheme : Overseas (Federation of British Industries), 635
Scholarships : Perkin Centenary, 787
  Research (Gas Council Awards), 530
  Research (B.B.C. Awards), 787
  Research Training (Animal Health Trust Awards for 1957-58), 412
  Trevelyan, 1394
Scholarships in Engineering (Hoover, Ltd.), 738
Scholarships in Glass Technology (Company of Glass Sellers), 1098
Scholarships in Medical Science : French Exchange (Medical Research Council Awards for 1957-58), 315
Scholarships for Study Abroad (British Council), 1325
Scholefield, Dr. P. G., and others : Effects of Sarcomycin on the Metabolism of Ehrlich Ascites Carcinoma Cells, 1109
School (Primary) : Science in the (B. L. H. Hampson), 1323
School (Summer), for undergraduates of all faculties (Universities Federation for Animal Welfare), 172
School of Tropical Medicine in London : History of the, 1899-1949 (Sir Philip Manson-Bahr), *review* by Prof. T. H. Davey, 205
School of Welding Technology (Established by the Institute of Welding), 413
School Natural History Societies, 276
School Natural History Societies, Association of : Ninth Annual Exhibition (O. N. Bishop), 1399
School Teachers and Industrialists : Mathematical Conference for, 467

- Schools : Report on the Industrial Fund for the Advancement of Scientific Education in, 103
  - Science in (British Association for the Advancement of Science, Section X (Assembly of Corresponding Societies), Discussion on), 730
  - Science Buildings for, 103
  - Scientific Research in (Joint Committee of the Royal Society and the Science Masters' Association to consider), 1393
- Schools (British Public), and the Future, 515
- Schools (Technical), in Prague—250th Anniversary (Prof J. S Rankin), 639
- Schools of Psychoanalytic Thought (Dr. Ruth L. Munroe), *review* by Dr. Clifford Allen, 772
- Schools and Colleges (American) : Physics taught in (American Institute of Physics, in collaboration with the American Association of Physics Teachers, the American Physical Society, the Fund for the Advancement of Education, and the National Science Foundation, Programme to improve the quality of), 1452
- Schramm, G : Protein Structure and Biological Activity, 835
- Schulman, Herbert M , and others : Protoplasts of *Escherichia coli* as Sources and Acceptors of Deoxypentose Nucleic Acid—Rehabilitation of a Deficient Mutant, 851
- Schulman, Dr. J. H. : Surface Activity, 225
- Schulz, Prof. G V. : Macromolecular Chemistry (Use of Polymerization as a Test Reaction for Investigating the Kinetics of Radical Reactions), 842
- Schulz, P. : Ionization Phenomena in Gases (High-pressure Discharges in Gas Mixtures), 792
- Schuphan, Prof W . Vegetable Quality, 174
- Schwartz, Heinz G , and Litwack, Prof Gerald : A Photometric Method for Avian Liver Xanthine Dehydrogenase, 761
- Schwimmer, Dr Sigmund : Phosphorylase Inhibitor in Potato—Separation from Activator and Possible Relation to Chlorogenic Acid, 149
- Sciatic Nerve (Normal) : Histochemical Appearances of Cholinesterase in the, and the Changes which occur after Nerve Section (Dr. R. S. Snell), 378
- Science in Burma, 269
- Science : Archaeology as—Purposes and Pitfalls (Prof C F C. Hawkes), 483
  - Christian Faith and the Freedom of (Dr. R. Hooykaas), 71
  - Electrical, *review* by H. Kayser, 875
  - History and Philosophy of, at University College, London, 267
  - Industry and Technical Progress—Factors Governing the Speed of Application of (Prof C F. Carter and Prof. B. R. Williams), *review* by Dr R Beeching, 301 , 305
  - Planning of (World Federation of Scientific Workers Symposium on), 583
  - Recent Advances in—Physics and Applied Mathematics (edited by Prof Morris H Shamos and Prof. George M. Murphy), *review* by G R. Noakes, 206
  - University Course in Arts and (Report of the General Board of the Faculties of the University of Cambridge), 173
- Science and its Background (Dr H. D. Anthony), third edition, *review* by W L. Sumner, 1267
- Science in the Federal Government, a History of Policies and Activities to 1940 (A Hunter Dupree), *review* by R Brightman, 568
- Science in the Primary School (B L. H. Hampson), 1323
- Science in Schools (British Association for the Advancement of Science, Section X (Assembly of Corresponding Societies), Discussion on), 730
- Science in the Use of Coal (Institute of Fuel Conference on), 531, 893
- Science of Metals at Oxford, 1319
- Science and Freedom, International Committee on : Bulletin No 9, *Apartheid* and its threat to South Africa's Universities, 686
- Science and Freedom, International Committee on, in co-operation with the Association of University Teachers . Meeting in London in support of the South African Universities against *apartheid*, 686, 1163
- Science and Poetry : Thought, Life and Time as reflected in (Dr. H C. Wood), *review* by F I. G. Rawlins, 676
- Science and Society, *review* by Dr C. K Grant, 1255
- Science and Technology Opportunities for Girls and Women in (British Federation of University Women Report on), 127
- Science, Technology and Industry in the Western World : Co-operation in, 1377
- Science and the United States Government, *review* by R Brightman, 568
- Science and Values, *review* by Prof J. D Bernal, 104
- Science (Coal) : Second International Conference on (Dr. I G C. Dryden), 417
- Science (Greek) : The Striving for Rigour in (Prof. C. Lanczos), 843
- Science (Industrial) : Records and Research in Engineering and (Dr. J. Edwin Holmstrom), third edition, *review* by R Brightman, 453
- Science (Medical) . French Exchange Scholarships in (Medical Research Council Awards for 1957-58), 315
- Science (Modern), and Human Values (Prof Everett W Hall), *review* by Prof J D. Bernal, 104
- Science (Nuclear), National Institute for Research in : Work on the, 315
  - New Laboratory to be called the Rutherford High Energy Laboratory, 1391
  - Appointment of Dr. T. G Pickavance as first director of the Rutherford High Energy Laboratory, 1391
- Science Buildings for Schools, 103
- Science Grants : The Case for, 1
- Science Masters' Association Annual Meeting, 1098
- Science Masters' Association (Royal Society and the) : Formation of a Joint Committee to consider Scientific Research in Schools, 1393
- Science Museum, London : The First Hundred Years, 121
  - The International Geophysical Year (J. Wartnaby), *review* by G A Bull, 519
- Science Teaching at King's College, Taunton, 472
- Sciences (Aeronautical), United States Institute of the (Royal Aeronautical Society and the) . Sixth Anglo-American Aeronautical Conference, 413
- Sciences (Behavioral), Center for Advanced Study in the (Stanford, California) : Conference on Ethology and Comparative Psychology, 362
- *Sciences (Biological), International Abstracts of*, 268
- Sciences (Medical), International Organizations of : Symposium on the Physiopathology of the Reticulo-Endothelial System (edited under the direction of B. N. Halpern by B. Benacerraf and J. F Delafresnaye), *review* by Prof. T. Nicol and D. L. J. Bilbey, 1155
- Sciences (Physical) : Ordinary Non-Linear Differential Equations in Engineering and (Prof N. W. McLachlan), second edition, *review* by Dr. L S. Goddard, 58
- Sciences (Social) : The Canada Council for the Encouragement of the Arts, Humanities and, 356
- *Scientific American* : Twentieth-Century Bestiary, *review*, 1268

Scientists and Technologists for Industry : Supply of (Dr. P. F. R. Venables), 305
Sclerotic Granules : Production of, by *Streptomyces* sp. (Dr. M. L. Gattani), 1293
Sclerotinites : Anisotropy of (D. Chandra), 297
Sclerotium Germination : Stimulation of, in *Sclerotium cepivorum* Berk. (J. R. Coley-Smith and Dr. C. J. Hickman), 445
Sclerotium cepivorum Berk. : Stimulation of Sclerotium Germination in (J. R. Coley-Smith and Dr. C. J. Hickman), 445
Sclerotium rolfsii (Sacc.) : A Physiological Effect of Triethanolamine on the Development of (S. Lavee), 1494
Sclerotization and Melanization—Two Independent Processes in the Cuticle of the Desert Locust (Dr. S. R. A. Malek), 237
Scotland : Natural Gas in (T. S. Ricketts and D. C. Elgin), 1444
Scott, Dr. A. I. : Appointed a lecturer in chemistry at the University of Glasgow, 1172
Scott, G. A. M. : Awarded a Nature Conservancy Research Studentship for Postgraduate Training in Ecology (Botany), 467
Scott, J. M. C. : Estimating the Life of a Satellite, 1467
Scott, Rev. Michael : University Apartheid in South Africa, 1164
Scott, M. G., and Scott, Patricia P. : Studies on Fertility (Effects on the Reproductive Organs of Cats of Chronic Infections, Dietary Inadequacies and Ligation of the Pancreatic Duct), 227
Scott, Patricia P. (Scott, M. G., and) : Studies on Fertility (Effects on the Reproductive Organs of Cats of Chronic Infections, Dietary Inadequacies and Ligation of the Pancreatic Duct), 227
Scott, Dr. R. A. : Quality Control of Food (Automatic Control of Proportioning and Mixing), 1327
Scott, R. P. W. : Vapour Detectors for Gas Chromatography (The Hydrogen Flame Detector), 23
Scott, R. P. W., and Cheshire, J. D. : High-Efficiency Columns for the Analysis of Hydrocarbons by Gas-Liquid Chromatography, 702
Scott, Dr. W. H. : Commonwealth Industrial Conference, *review*, 876
Scott, W. N. : Appointed deputy director, East African Trypanosomiasis Research Organization, East Africa High Commission, 413
Scott Microflame Detector for Gas Chromatography (Shandon Scientific Co., Ltd.), 530
Scottish Home Department (Ministry of Agriculture, Fisheries and Food and the) : Formation of a Committee of Inquiry into the Fishing Industry, 1171
Scottish Office (Ministry of Housing and Local Government and) : The Surface Water Year-Book of Great Britain (1954-55), 223
Scrapie : Significance of Vacuolated Neurones in the Medulla of Sheep affected with (I. Zlotnik), 393
Scratch Effect : The Glass, and Molecular Structure (Dr. J. Bourdillon), 1475
Scudder, G. G. E. : Reinterpretation of some Basal Structures in the Insect Ovipositor, 340
Scurvy (Severe) : Ultrastructure of Erythrocytes in (Prof. Bruno Kisch and Gustav J. Martin), 812
Scythians : The (Tamara Talbot Rice), *review* by M. C. Burkitt, 1310
Sea : Production of Carbon in the (Dr. J. H. Oliver), 617 ; (D. H. Cushing), 617
Sea (Eastern Mediterranean) : Structure of the Crust under the (J. Cl. De Bremaecker), 755
Sea (Southern North) : On the Herring of the (D. H. Cushing and A. C. Burd), 1330
Sea and in the Air : Avoidance of Collision at—Collisions at Sea (Capt. F. J. Wylie), 213 ; Collisions in the Air (D. O. Fraser), 214
Sea Anemone : Identification and Distribution of 5-Hydroxytryptamine in a (A. P. Mathias, D. M. Ross and Dr. M. Schachter), 658
Sea Urchins : The American Arbacia and other (Ethel Browne Harvey), *review* by Dr. D. B. Carlisle, 1268
Sea Water : Nature of the Bactericidal Agent in (J. K. Johannesson), 285
  State of Iodine in (T. I. Shaw and L. H. N. Cooper), 250
Sea-Water (Trapped) : A Lake with (Prof. Kaare Strøm), 982
Seals (Elephant), on the Antarctic Continent (Susan E. Ingham), 1215
Search for a Potassium Compartment in the Human Red Cell Membrane (A. K. Solomon, June Loucks, Daniel A. Pollen, Thomas J. Gill, 3rd., and Elizabeth Wolf), 993
Search for and Use of Natural Resources, 735
Searching the Literature (M. A. Short), 736
Sebruyns, Prof. M., and others : Subendothelial Space between the Ovarian Interstitial Cell and the Endothelial Lining of the Blood Sinusoids, 1431
Second Foetal Haemoglobin in the Newborn Goat : Evidence of a (Dr. T. H. J. Huisman, H. K. A. Visser and H. J. van der Helm), 758
Second Lesson : The—Seven Years at the United Nations (Bernard Moore), 933
Second Oxytocin in the Hypothalamus (P. A. Robertson and Dr. R. W. Harker), 343
Secretion of Heparin by Mast Cells (Dr. M. Hill), 654
Secretion of Progesterone by the Adrenal Gland (Dr. W. E. Balfour, Dr. R. S. Comline and R. V. Short), 1480
Sectioning with Rocking Microtomes : Ultra-thin Serial (Arwyn Charles), 1302
Secular Changes of the Units and Constants of Physics (A. H. Cook), 1194
Sediments (Ocean) : Localization of Radioactive and Stable Heavy Nuclides in (G. Arrhenius, M. N. Bramlette and E. Picciotto), 85
Seed Germination : Effects of Red and Far-Red Radiation on (Avishag Kadman-Zahavi), 996
Seedlings (Apple) : Vesicular-Arbuscular Mycorrhizas in (Dr. Lilian E. Hawker and Angela M. Ham), 998
Seedlings (Cacao), in Nigeria : A Die-back of, caused by a Species of *Phytophthora* (S. R. Chant), 1494
Seedlings (Living) : Germination of Oospores of *Pythium mamillatum* in Response to Exudates from (Richard Barton), 613
Seeds : Action of Blue Light on the Germination of (Prof. Michael Evenari, Dr. Gert Neumann and Dr. Gabriel Stein), 609
Seeds, Committee on Transactions in : Inquiry into Plant Breeders' Rights, 893
Seeds (Light-inhibited) : Sensitivity of, to certain Spectral Regions (M. Black and Dr. P. F. Wareing), 395
Seeds of Life—the Story of Sex in Nature from the Amoeba to Man (John Langdon-Davies), *review* by T. H. Hawkins, 159
Seeley, J. S., and others : Some Observations of the Infra-red Solar Spectrum from a High-flying Aircraft, 1187
Seismic Recordings of Atomic Explosions in Australia (H. A. Doyle), 132
Seismic Waves *Lg* and *Rg* across Australia : Velocity of the (B. A. Bolt), 495
Seitz, Frederick, and Turnbull, David (edited by) : Solid State Physics, Vol. 1 and Vol. 3, *review* by Dr. R. O. Davies, 770
Sekine, Tatsuya (Saito, Prof. Nobufusa, and) : Anion Exchange Behaviour of Yttrium, 753
Sekla, Dr. B. (Holečková, E., and) : Antitumour Effect of Culture Media from Tumour-Immune Spleens, 1298
Selection of University Entrants, 299
Selectively Balanced Polymorphism at a Sex-linked Locus (Prof. J. H. Bennett), 1363
Selenium : Ineffectiveness of, in the Treatment of Nutritional Muscular Dystrophy in the Rabbit (Prof. H. H. Draper), 1419
Selenomethionine in Enzymatic Transmethylations (Dr. S. Harvey Mudd and Dr. G. L. Cantoni), 1052
Self-Fertilization : Hermaphroditism with, and the Monthly Extrusion of Unfertilized Eggs, in the Viviparous Fish *Lebistes reticulatus* (Dr. H. Spurway), 1248

Selye, Prof. H. : Sensitization by Œstradiol to the Production of Experimental Nephrocalcinosis, 1420
Semenov, Prof. N. V. : Macromolecular Chemistry, 842
Semi-Conductor Contacts : Rectifying (H. K. Henisch), *review* by Dr. A. A. Shepherd, 566
Semiconductor Physics, *review* by Prof. R. E. Burgess, 1265
Semiconductor Surface Physics—Proceedings of the Conference on the Physics of Semiconductor Surfaces, Philadelphia, 1956 (edited by R. H. Kingston, with the assistance of E. Burstein, A. L. McWhorter, P. H. Miller, Jr., D. T. Stevenson and P. B. Weisz), *review* by Dr. J. R. Tillman, 675
Semiconductors (Physical Society, in collaboration with British Thomson-Houston, Ltd., Spring (1956) Meeting on), 25
Semiconductors, their Theory and Practice (Prof. G. Goudet and C. Meuleau), translated by G. King, *review* by Dr. A. A. Shepherd, 566
  Theory and Technology of, *review* by Dr. A. A. Shepherd, 566
Semiconductors, Ltd., Ilford : Appointment of Dr. James Reekie as chief engineer, 787
Semi-continuous Method for the Large-scale Production of Tetanus Toxin (Dr. Robert O. Thomson), 1126
Semimicro Qualitative Organic Analysis (Prof. Nicholas D. Cheronis and Prof. John B. Entrikin), second edition, *review* by Dr. W. J. Hickinbottom, 567
Semi-Microchemical Methods : Micro- and (Norwood Technical College Course on), 1171
Sen Gupta, A. B., and others : Examination of the Oligosaccharides isolated from Jute α-Cellulose, 1041
Sensitive Bacteria : Role of Cations in Phage Adsorption to (J. Beumer, J. Dirkx and M. P. Beumer-Jochmans), 83
Sensitivity of Broad Bean Roots to γ-Radiation : Dependence on Oxygen and Temperature of the (G. J. Neary), 248
Sensitivity of Light-inhibited Seeds to certain Spectral Regions (M. Black and Dr. P. F. Wareing), 395
Sensitivity of Pancreas Hexokinase towards Alloxan and its Modification by Glucose (Dr. C. Villar-Palasi, Dr. A. Carballido, Dr. A. Sols and Dr. J. L. Arteta), 387
Sensitization by Œstradiol to the Production of Experimental Nephrocalcinosis (Prof. H. Selye), 1420
Separation of Amino-Acids on Paper Chromatograms : A Rapid Procedure for the (Henry R. Roberts and Michael G. Kolor), 384
Separation of Talosamine from other 2-Amino Hexoses (Dr. M. J. Crumpton), 605
Separation and Identification of Aromatic Acids in Plant Tissues by Paper Chromatography (Dr. L. A. Griffiths), 286
Sera (Animal) : Starch-gel Electrophoresis of (Dr. A. L. Latner and Angel Habib Zaki), 1366
Serengeti National Park, Tanganyika, 584
Sergeev, I. V., and Udintsev, G. B. : A New Submarine Mountain in the Pacific Ocean, 530
Serial Sectioning with Rocking Microtomes : Ultra-thin (Arwyn Charles), 1302
Serlupi-Crescenzi, Giovanni, and Ballio, Alessandro : Structure of a New Pyridine Nucleotide isolated from *Penicillium chrysogenum*, 1203
Serological Activity of Ovalbumin irradiated with Gamma-Rays : Role of Structural Degradation in the Loss of (Hugo Fricke, Charles A. Leone and Wendell Landmann), 1423
Serological Changes Concomitant with the Growth of Mouse Tumours in Pretreated Rats (M. Pikovski, C. Tal, M. Schlesinger and E. Margoliash), 185
Serological Reactions : Use of Logarithms to the Base 2 in Recording (John W. Vennes, Russell E. MacDonald and Philipp Gerhardt), 1363
Serological Studies on *Fusarium oxysporum* Schl. emend Sn. et H. (A. Tempel), 1463
Serology : Immunology and (Prof. Philip L. Carpenter), *review* by Prof. J. R. Marrack, 257
Serology (Blood Group) : An Introduction to (Kathleen E. Boorman and Dr. Barbara E. Dodd), *review* by Dr. F. Stratton, 675
Serotonin and Indoleacetic Acid : Probable Evolutionary Relationship of, and some Practical Consequences Therefrom (Dr. D. W. Woolley), 630
Serum (Horse) : Occurrence of an Amine Oxidase in (Bernadette Bergeret, Dr. Hermann Blaschko and Rosemary Hawes), 1127
Serum Albumin (Bovine), and Ovalbumin : Liberation of Tyrosine Hydroxyl Groups in Urea Solutions of (A. N. Glazer, Dr. H. A. McKenzie and R. G. Wake), 1286
Serum β-Globulins (Human) : Variations in (Dr. O. Smithies), 1482
Serum Protein Differences in Cattle by Starch Gel Electrophoresis (G. C. Ashton), 917

Serum Proteins (Rat) : Production of, in Irradiated Mice (W. W. H. Weyzen and O. Vos), 288
Service of Industry, Festival of Films in the : Premier Award in the Films for Use in Schools Section won by 'Mirror in the Sky,' 891
Service of Man : Chemistry in the (Prof. Alexander Findlay), eighth edition, *review*, 774
Service Medal of the Textile Institute awarded to H. Pomfret and to Dr. P. P. Townsend, 1028
Seshadri, Prof. T. R. : Biogenesis of Natural Products (Part played by C_6-units in Natural Products), 680
Set (Permanent) : Chemical Mechanism of (R. S. Asquith, Prof. J. B. Speakman and E. Telgved), 502
Seven Animals (Edna Johnson), *review*, 676
Seven Birds (Edna Johnson), *review*, 676
Seven Pond Creatures (Edna Johnson), *review*, 676
Seven Trees (Edna Johnson), *review*, 676
Severe Scurvy : Ultrastructure of Erythrocytes in (Prof. Bruno Kisch and Gustav J. Martin), 812
Sewage Effluent Channel : Vernal Sloughing of Sludge Deposits in a (R. W. Edwards), 100
Sex in Flowering Plants : Expression of (Prof. H. G. Baker), 614
Sex of Human Abortions : Determination of the, by Nuclear Sexing the Cells of the Chorionic Villi (Prof. A. C. Stevenson and R. H. McClarin), 198
Sex in Nature from the Amoeba to Man : Seeds of Life—the Story of (John Langdon-Davies), *review* by T. H. Hawkins, 159
Sex Ratio of Fowl : Primary (Prof. Walter Landauer), 1139
Sex-linked Difference in Rabbit Neutrophils (P. J. Carpentier, L. A. M. Stolte and M. J. Dobbelaar), 554
Sex-linked Locus : Selectively Balanced Polymorphism at a (Prof. J. H. Bennett), 1363
Sexing (Nuclear), the Cells of the Chorionic Villi : Determination of the Sex of Human Abortions by (Prof. A. C. Stevenson and R. H. McClarin), 198
Sexual Dimorphism in Labiatae (Audrey Plack), 1218
Schaeffer, Susan G. (Garber, Prof. E. D., and) : Methionine Biosynthesis and Utilization in *Pseudomonas tabaci* and *Ps. angulata*, 1282
Shalgosky, H. I. : Modern Analytical Chemistry in Industry (Polarography), 368
Shamos, Prof. Morris H., and Murphy, Prof. George M. (edited by) : Recent Advances in Science—Physics and Applied Mathematics, *review* by G. R. Noakes, 206
Shandon Scientific Co., Ltd. : Scott Microflame Detector for Gas Chromatography, 530
Shape of Cartilage Mucoprotein : Size and (Dr Giorgio Bernardi), 93
Shape of Chain-like Polyelectrolyte Molecules : Influence of Ion Exchange on Size and (R. E. Cooper and Dr. A. Wassermann), 1072
Shape (Polyhedral), of Adenovirus Particles as shown by Electron Microscopy (Dr. R. C. Valentine and Dr. P. K Hopper), 928
Shapiro, B. (Epstein, B., and) : Intestinal Lecithinase, 387
Shapiro, Dr. Herman S., and others : Protoplasts of *Escherichia coli* as Sources and Acceptors of Deoxypentose Nucleic Acid—Rehabilitation of a Deficient Mutant, 851
Shapiro, Dr. S. : Tree Physiology (Root-Growth), 78
Sharma, Dr. Arun Kumar, and Talukdar, Miss Chitra : Structural Heterozygosity of *Cipura paludosa*, Aubl., 662
Sharma, Dr. G. P., and Parshad, Ram Lampbrush Chromosomes in Insects, 147
Sharman, G. B., and others : Chromosome Polymorphism in the Common Shrew, 392
Sharvin, Y. V : Low-Temperature Physics (Surface Tension between the Superconductive and the Normal State in Very Pure Tin Single Crystals), 461
Shaw, Dr. B. : Appointed lecturer in medical biochemistry and pharmacology at the University of Birmingham, 738
Shaw, J. : Given an award under the Royal Society and Nuffield Foundation Commonwealth Bursaries Scheme, 119
Shaw, Prof. T. H. : Occurrence of the Muskrat in Hu Ma District, North-eastern China, 1215
Shaw, T. I., and Cooper, L. H. N. : State of Iodine in Sea Water, 250
Sheep : Changes in the Intestinal Mucosa of the, following Death by Humane Killer (A. M. Badawy, R. M. Campbell, Dr. D. P. Cuthbertson and B. F. Fell), 756
  Classification of Wool Follicles in (Dr. A. B. Wildman), 99
  Water Metabolism in the (J. V. Evans), 756
Sheep affected with Scrapie : Significance of Vacuolated Neurones in the Medulla of (I. Zlotnik), 393
Sheep Homozygous for Different Haemoglobin Types : Myoglobins from (H. J van der Helm, R. Timmer and Dr. T. H. J. Huisman), 240
Sheep Lungworm *Protostrongylus brevispiculum* in Great Britain (Dr. J. H. Rose, J F. Michel and S. T. Harris), 1372
Sheffield College of Commerce and Technology (Department of Operational Research and Cybernetics of the United Steel Companies, Ltd., in co-operation with the) · Lectures on Operational Research and Cybernetics in Industry, 72, 531
Sheffield Interchange Organization, 269
Shefner, Alan, M., and Burkhardt, Betty J · Reversal of Boric Acid Inhibition of Growth in certain Soil Micro-organisms, 1207
Shelbourne, J E. : Site of Chloride Regulation in Marine Fish Larvae, 920
Shelford, Capt W O. : Underwater Swimming and Diving, 885
Shelley, Dr. Walter B., and Hurley, Dr Harry J. : Experimental Evidence for an Allergic Basis for Granuloma Formation in Man, 1060
Shells (Snail) : Interference in Soil Phosphorus Analyses by (P. M. McDonnell), 90
Shemin, Dr David, and others : The Harvey Lectures, Series 50 (1954–1955), *review* by Prof. W Burns, 157
Shepherd, Dr A A : Theory and Technology of Semiconductors, *review*, 566
Shepherd, Audrey M. : Development of Beet Eelworm, *Heterodera schachtii* Schmidt, in the Wild Beet, *Beta patellaris*, 341
Shepherd, D. J (Robertson, Dr. W. G. P , and) · High Polymer, Colloid and Surface Chemistry (Cross-linking Efficiency of Monomers in Polyester Resins), 960
Sheppard, Prof. P. A. : Elected president of the Royal Meteorological Society, 21
  Obituary of Prof. C.-G. Rossby, 1166
  Planetary Atmospheres and Convection in Rotating Fluids (The General Circulation of the Earth's Atmosphere), 1456
Shera, Jesse H., and others : Documentation in Action, *review* by Prof. S. I. Tomkeieff, 674
Sherrington Memorial Lecture of the Royal Society of Medicine (Lord Adrian), 1028
Sherwood, J. N. : Awarded a Research Scholarship by the Gas Council, 530
Sherwood, R. G. (Sanders, Dr. J. V., and) : High Polymer, Colloid and Surface Chemistry (Thermodynamics of Mixtures of Silicones and Benzene), 960
Sherwood, R. J. : Safety in the Chemical Industry (Manufacture and Handling of Radioactive Substances), 1399
Shibuya, Shin'ichi, and Ouchi, Shunji : Isolation of 2-Aminoethanesulphinic Acid from a Mollusc, 549

  Frequency Modulation in Radio, *review*, 206
  Pulse Circuits and Multivibrators, *review*, 401
Smithies, Dr O. : Variations in Human Serum β-Globulins, 1482
Smithsonian Institution, Washington · Report for 1955-56, 21
  Appointment of Dr. Martin H. Moynihan as resident naturalist of the Panama Canal Zone Biological Area on Barro Colorado Island, 413
  Appointment of Prof. P. S Hopkins as director of the National Air Museum, 1098
Smoke Abatement Society : Annual Conference, 637
  Presidential Address · The Primary Sources of Air Pollution (Dr. R. Lessing), 637
  Des Voeux Memorial Lecture (Sir Graham Sutton), 637
Smoke Products (Fresh Cigarette) : Decrease in Fluorescence Intensity of a Solution of, on Exposure to Light (Hilda Johnston), 1350

Smoking and Lung Cancer—Report of the Tobacco Manufacturers' Standing Committee (Dr. I. Heiger), 308
Smollett, Dr. M.: Transistors (Germanium Photo-transistors), 1330
Smooth Colony Forms of some Species of *Pasteurella*: A Protein Antigen associated with (Dr. M. J. Crumpton and Dr. D. A. L. Davies), 863
Smooth Muscle: Mechanism of Contraction of, by Drugs (Dr. D. H. L. Evans and Dr. H. O. Schild), 341
Smooth Muscles: Structure of (Dr. Jean Hanson and Dr. J. Lowy), 906
Smyth, Christabel: Science in Schools (A Geological Tour in the Neighbourhood of Dublin), 732
Smyth, Dr. C. N., and Poynton, F. Y.: Grant of £2,600 from the Paul Instrument Fund Committee, for continuation of the construction of an ultrasonic microscope, 270
Smyth, M. J., and others: Combined Light and Velocity Measurements of the Variable Star 12 Lacertae, 1112
Snail Shells: Interference in Soil Phosphorus Analyses by (P. M. McDonnell), 90
Snake (Rattle-) Venom: Phosphodiesterase from (Prof. M. Laskowski, Gloria Hagerty and Ulla-Riitta Laurila), 1181; (Dr. Hans G. Boman), 1182
Snake (Tiger), *Notechis scutatus*: Additional Purine Compounds in the Venom of the (Hazel M. Doery), 799
Snell, Prof. Esmond E. (Kalyankar, Dr. G. D., and): Differentiation of α-Amino-Acids and Amines by Non-Enzymatic Transamination on Paper Chromatograms, 1069
Snell, Dr. R. S.: Histochemical Appearances of Cholinesterase in the Normal Sciatic Nerve and the Changes which occur after Nerve Section, 378
Snell, R. W.: Appointed lecturer in petroleum production engineering at the University of Birmingham, 738
Soap (Middle), and Neat Soap: Structure of the Liquid-Crystal Phases of the Soap—Water System— (Dr. V. Luzzati, H. Mustacchi and A. Skoulios), 600
Soap (Middle Soap and Neat): Structure of the Liquid-Crystal Phases of the Soap—Water System— (Dr. V. Luzzati, H. Mustacchi and A. Skoulios), 600
Soap—Water System: Structure of the Liquid-Crystal Phases of the—Middle Soap and Neat Soap (Dr. V. Luzzati, H. Mustacchi and A. Skoulios), 600
Sobotka, Dr. Harry, and others: Vitamin B_{12} Distribution between Plasma and Cells, 1043
Social Implications of Automation, 669
Social Sciences: The Canada Council for the Encouragement of the Arts, Humanities and, 356
Società Italiana di Fisica: Third International Conference on Ionization Phenomena in Gases, 790
Société Chimique de France: Centenary of the, 1165
Société Française de Métallurgie: Autumn Meeting, 219
  Grand Medal presented to Prof. G. Chaudron, 219
  Rist Prizes presented to G. Pomey and A. Gueussier, 219
Societies (Tribal): Government and Politics in (Prof. I. Schapera), *review* by Dr. A. L. Epstein, 1442
Society: Love and, *review* by Prof. T. S. Simey, 157
  Science and, *review* by Dr. C. K. Grant, 1255
Society Today: Scientists in (Viscount Hailsham), 1311
Soddy, Frederick: A Tribute to (Prof. F. A. Paneth), 1085
Sodium Chloride Recrystallization Phosphors: Thallium-activated (Z. Morlin), 89
Sodium Fluoride (Stannous or of): Fluoride Removal by Powdered Dental Enamel from Solutions of (Dr. Frank A. Smith, Dwight E. Gardner, Dr. Samuel E. Leach and Dr. Harold C. Hodge), 1421
Sodium Ions and Tissue Metabolism—some Metabolic Peculiarities of Brain Tissue (Genkichiro Takagaki and Yasuzo Tsukada), 707
Sodium Octyl Sulphate in Saturated Salt Solutions: Surface Properties of (E. Matijević and J. Rogers), 560
Sodium Salt of the Directly Reacting Bile Pigment (Dr. Ed. Talafant), 1051
Sodium, Potassium and Calcium Ions in the Haemolymph of *Oncopeltus fasciatus* (Dallas), (Prof. James A. Mullen), 813
Sodium, Potassium and Water in the Rat: Effect of Angiotonin on the Distribution of (Prof. Sydney M. Friedman, Constance L. Friedman and Miyoshi Nakashima), 194
Softening of Steels by Cold-Working (P. Chollet and H. P. Tardif), 754
Soil: International Group for the Study of the Fauna of the, 218
  Rate of Entry of Radioactive Strontium into Plants from (Dr. R. Scott Russell and G. M. Milbourn), 322
Soil Amoebae in Sterile Liquid Medium: A Technique for Obtaining Clone Cultures of (D. Harrison), 1301
Soil Bacteria: Solution of Mineral Phosphates by (Joan I. Sperber), 994, *errata*, 1454
Soil Fertility and Fertilizers (Samuel L. Tisdale and Werner L. Nelson), *review* by Dr. A. M. Smith, 3
Soil Improvement and Better Crops, *review* by Dr. A. M. Smith, 3
Soil Mechanics and Foundation Engineering—Fourth International Conference (D. J. Maclean), 839
Soil Mechanics and Foundation Engineering, International Society of: Fourth Conference, 270, 839
  Election of Prof. A. W. Skempton as president, 840
Soil Microbiology (J. S. Waid and D. Parkinson), 591
Soil Microbiology at Rothamsted, 634
Soil Micro-organisms: Reversal of Boric Acid Inhibition of Growth in certain (Alan M. Shefner and Betty J. Burkhardt), 1207
Soil Phosphorus Analyses: Interference in, by Snail Shells (P. M. McDonnell), 90
Soil Physics (Dr. L. D. Baver), third edition, *review*, 774
Soil Transmission of Beet Ringspot Virus to Peach (*Prunus persica*), (Dr. B. D. Harrison), 1055
Soils: Farm (Prof. Edmund L. Worthen and Prof. Samuel R. Aldrich), fifth edition, *review* by Dr. A. M. Smith, 3
  Methods of Studying the Microbiology of (Symposium at the University Institute of Agronomy, Louvain), 591
  Nucleic Acid Derivatives in (G. Anderson), 287
Soils (Terrestrial): Pollen in (G. W. Dimbleby), 229
Soils, Plants and Animals: Trace Elements in (Agriculture Group and the Bristol Section of the Society of Chemical Industry Symposium on), 23
Solanum Species (Native): Infection of, by the Potato Blight Fungus (C. M. Driver), 1367
Solar Activity: Recent (Dr. M. A. Ellison), 1173
Solar 'Blow-Off' Prominence (Dr. M. A. Ellison), 589
Solar Energy—a Challenge to the Future (Dr. Harold Heywood), 115
Solar Energy and the Depth of the Earth (N. V. Belov and V. I. Lebedev), 1324
Solar Energy Science and Engineering, Journal of, 268
Solar Flare: Rocket Observation of X-Ray Emission in a (Dr. J. W. Warwick and Dr. H. Zirin), 500; (Dr. T. A. Chubb, Dr. H. Friedman, R. A. Kreplin and J. E. Kupperian, jun.), 501
Solar Granulation and its Observation from a Free Balloon (Dr. D. E. Blackwell, Dr. D. W. Dewhirst and Dr. A. Dollfus), 211
Solar Noise: Short Time Transients in (T. de Groot), 382
Solar Radio Noise: Duration of Transients in (O. Elgaroy), 808
  Frequency Drift of Short-Time Transients in (O. Elgaroy), 862
Solar Radio Outbursts: Polarization of (Kenji Akabane and Takeo Hatanaka), 1062
Solar Summary for 1956 (United States Naval Observatory, Circular 77), 687
Solar Spectrum (Infra-red): Some Observations of the, from a High-flying Aircraft (J. T. Houghton, Dr. T. S. Moss, J. S. Seeley and T. D. F. Hawkins), 1187
Solid Catalysts: Effect of Ionizing Radiation on (R. W. Clarke and E. J. Gibson), 140
Solid Metal Surfaces: Wetting and Spreading of Liquid Metals on (Department of Industrial Metallurgy, University of Birmingham, Joining of Metals Conference on), 72, 1156
Solid Solutions (Polyacene): Energy Transfer in (F. R. Lipsett), 786
Solid State: Photochemical Stability of Dyes in the (Dr. G. S. Egerton and A. G. Roach), 1349
  Physics of the, *review* by Dr. R. O. Davies, 770
Solid State Physics (edited by Frederick Seitz and David Turnbull), Vol. 1 and Vol. 3, *review* by Dr. R. O. Davies, 770
Solid Systems in Chemical Engineering, *review* by Prof. J. M. Coulson, 823
Solids: Initiation and Growth of Explosion in (Royal Society Discussion on), 73
Solids (High) Pectin Gels: Relationship of the Strength of, to the Concentration and Jelly-forming Capacity of the Pectin Present (Dr. Peter Wade), 1067
Solomon, A. K., and others: Search for a Potassium Compartment in the Human Red Cell Membrane, 993
Solomon, D. H.: High Polymer, Colloid and Surface Chemistry (Polymeric Structures of Block or Graft Type), 960
Sols, Dr. A., and others: Sensitivity of Pancreas Hexokinase towards Alloxan and its Modification by Glucose, 387
Solubilization of Copper by Leaves and Water-soluble Acids from Leaf Wax (Defence Mechanism of Plants against Fungi), (Dr. J. T. Martin and E. Somers), 797
Soluble Deoxypolynucleotides released in Mouse Spleen by X-Irradiation: Chromatographic Characterization of (Dr. R. K. Main, L. J. Cole and M. E. Ellis), 1285
Solution: Observation of Short-lived Free Radicals in (Prof. G. Porter and M. W. Windsor), 187
Solution of Fresh Cigarette Smoke Products: Decrease in Fluorescence Intensity of a, on Exposure to Light (Hilda Johnston), 1350
Solution of Mineral Phosphates by Soil Bacteria (Joan I. Sperber), 994, *errata*, 1454
Solution Concentration-gradients: A Simple Device for Forming (Donald B. Wetlaufer), 1122
Solutions of Stannous or of Sodium Fluoride: Fluoride Removal by Powdered Dental Enamel from (Dr. Frank A. Smith, Dwight E. Gardner, Dr. Samuel E. Leach and Dr. Harold C. Hodge), 1421
Solutions (Aqueous): Interaction between Organic Hydroxy Acids and Silicic and Germanic Acids in (E. R. Clark and J. A. Waddams), 904
  Ultra-Violet Absorption Spectra of L-Ascorbic Acid in (Dr. J. S. Lawendel), 434
Solutions (Chromate): Passivation of Iron by (Miss D. M. Brasher, A. H. Kingsbury and A. D. Mercer), 27; (Miss D. M. Brasher and C. P. De), 28
Solutions (Ionic): Interaction in (Faraday Society Discussion on), 172
Solutions (Polyacene Solid): Energy Transfer in (F. R. Lipsett), 786
Solutions (Saturated Salt): Surface Properties of Sodium Octyl Sulphate in (E. Matijević and J. Rogers), 560
Solutions (Urea), of Bovine Serum Albumin and Ovalbumin: Liberation of Tyrosine Hydroxyl Groups in (A. N. Glazer, Dr. H. A. McKenzie and R. G. Wake), 1286
Solvent Effects and Reaction Mechanism (Queen Mary College, London, Symposium on, under the auspices of the Chemical Society), 534
Solvents (Dr. Thomas H. Durrans), seventh edition, *review* by E. H. Nurse, 258
Somatic and Autonomic Nerve Fibres in Tissue Sections: Differentiation of (A. D. Dixon), 709
Somers, E., and Richmond, D. V.: Defence Mechanism of Plants against Fungi—Sorption of Copper from Burgundy Mixture by Leaves, 798
Somers, E. (Martin, Dr. J. T., and): Defence Mechanism of Plants against Fungi—Solubilization of Copper by Leaves and Water-soluble Acids from Leaf Wax, 797
Soper, Dr. P. F.: Electro-Technology, *review*, 1309
Sorbitol: The Vitamin-sparing Action of (T. B. Morgan and Prof. John Yudkin), 543
Sorbitol and Glycerol: Conversion of Glycogen to, in the Diapause Egg of the *Bombyx* Silkworm (Haruo Chino), 606
Sørensen, Dr. N. Schwartz: Influence of Starvation and Glucose Load on the Activity of Liver Phosphorylase in Normal and Adrenalectomized Rats, 857
Sorm, Prof. F.: Recent Advances in the Chemistry of Terpenoid Compounds (Structure of Acorone and Laserpitine), 470
  Protein Structure and Biological Activity, 835
Sorption of Copper from Burgundy Mixture by Leaves (Defence Mechanism of Plants against Fungi), (E. Somers and D. V. Richmond), 798
Sorptive Mud Surface: Improved Persistence of Dieldrin Deposits on (Ph. Gerolt), 394
Soufre: Colloque sur la Biochimie du (Roscoff, 1956), 466
Soulet, M. (Chabbal, R., and): Interference Spectroscopy, 955
Soulsby, Dr. E. J. L., and Jennings, A. R.: A New Species of Coccidium (*Eimeria rissae* n. sp. Eimeriidae, *Sporozoa*) from the Kittiwake, *Rissa tridactyla tridactyla* (L.), 1057

Sound Localization : An Unexpected Effect in (D. H. Holding and J. P. Dennis), 1471
Sounds (Underwater), heard from Sperm Whales (L. V. Worthington and William E. Schevill), 291
Sources of Radio Noise on the Planet Jupiter (C. H. Barrow, T. D. Carr and Prof. A. G. Smith), 381
Sources and Acceptors of Deoxypentose Nucleic Acid : Protoplasts of *Escherichia coli* as—Rehabilitation of a Deficient Mutant (Prof. Erwin Chargaff, Herbert M. Schulman and Dr. Herman S. Shapiro), 851
Sources (Primary), of Air Pollution (Dr. R. Lessing), 637
South Africa : Academic Freedom in, 686
  Swedish Exploration in, *review* by Prof. O. Lowenstein, 56
  University Apartheid in (International Committee on Science and Freedom in co-operation with the Association of University Teachers Meeting on), 686, 1163
South African Animal Life—Results of the Lund University Expedition in 1950-1951 (edited by Bertil Hanstrom, P. Brinck and Gustaf Rudebeck), Vols. 1-3, *review* by Prof. O. Lowenstein, 56
South America : Travels in, *review* by Dr. G. H. S Bushnell, 1443
South Pacific · Sugar Industry in the, *review* by Sir Harold Hartley, 1378
South Pacific Enterprise—the Colonial Sugar Refining Company, Ltd. (edited by A. G. Lowndes), *review* by Sir Harold Hartley, 1378
Southall, R. B., and O'Neill, Prof. Hugh Museums in Britain, 1146
Southern Africa : Eels in (R. A. Jubb), 47
  The Freshwater Eel *Anguilla obscura* Gunther, 1871, in (R. A. Jubb), 1216
Southern Nigeria : Honey Bees in (Dr. J Birket-Smith), 511
Southern Pine : Acceleration of Life-cycle of (Earhart Plant Laboratory of the California Institute of Technology), 892
Southward, A. J. : Research in Marine Biology (Effects of Temperature and Age on Barnacles), 746
Sowerby, James : Exhibit to commemorate the work of (British Museum (Natural History)), 70
Space Travel : Realities of—Selected Papers of the British Interplanetary Society (edited by L. J Carter), *review* by Prof. D. R. Bates, 453
  Relativity and (J. H. Fremlin), 499 , (Prof. Herbert Dingle), 500
Spacings (Interlayer), of Graphitic Carbons (Prof P. L. Walker, jun., and George Imperial), (Structure of Graphites), 1184
Speckman, W., and others : At the Second International Conference on Coal Science (Colour film showing the Behaviour of certain Coal Constituents on Heating Thin Sections under the Microscope), 419
Spärck, Dr. Ragnar, and others (edited by) : The Galathea Deep Sea Expedition, 1950-1952 (translated from the Danish by Reginald Spink), *review* by Dr. L. Harrison Matthews, 349
Sparnaay, Dr. M. J. : Attractive Forces between Flat Plates, 334
Spatial Asymmetries in π-μ Decay (Dr. J. M. Cassels), 1245
Speakman, Prof. J. B., and others : Chemical Mechanism of Permanent Set, 502
Speakman, Dr. J. S. : Awarded an Alexander Pigott Wernher Memorial Travelling Fellowship in Ophthalmology and Otology for 1957-58 by the Medical Research Council, 315
Species of *Pasteurella* : A Protein Antigen associated with Smooth Colony Forms of some (Dr. M. J. Crumpton and Dr. D A. L. Davies), 863
Species of *Phytophthora* : A Die-back of Cacao Seedlings in Nigeria caused by a (S. R. Chant), 1494
Species of *Pullularia* : Nitrogen Fixation by a (Dr. Margaret E. Brown and Dr. George Metcalfe), 282
Species of Schistosomes : Possible Occurrence of Strains in (B. Verdcourt), 865
Species (A New), of Coccidium (*Eimeria rissae* n. sp. Eimeriidae, *Sporozoa*) from the Kittiwake, *Rissa tridactyla tridactyla* (L.), (Dr. E. J. L. Soulsby and A. R. Jennings), 1057
Species (Two), of *Trachelomonas* (Euglenineae) without Chlorophyll (Prof. E. G. Pringsheim), 1296
Species Studies in the British Flora (edited by J. E. Lousley), (Botanical Society of the British Isles, Conference Report No. 4), *review*, 1155
Specific DDT-Resistance in Houseflies (R. W. Kerr, D. G. Venables, W. J. Roulston and H. J. Schnitzerling), 1132
Specific (A Highly) Growth-Inhibitory Factor produced by certain *Acetobacter* Species (Dr. Robert Steel and Prof. Thomas K. Walker), 811
Specific Inhibition Studies relating to the Lewis Blood-Group System (Dr. Winifred M Watkins and Prof. W T J. Morgan), 1038
Specific Inhibitors of True- and Pseudo-Enzyme : Insensitivity of Chicken Cholinesterases to (Prof. W Ferrari), 144
Specificity of Rennin : Activity and (J. C. Fish), 345
Spector, W. G., and others : Role of Organ-Specific Antigen during 4-Dimethylaminoazobenzene Carcinogenesis in the Rat Liver, 289
Spectra : Difference and Derivative (Dr. A. E. Martin), 231
Spectra of Flames supported by Active Nitrogen (K R. Jennings and Dr. J. W. Linnett), 1272
Spectra (Absorption) of Flat Flames using a Multiple-Reflexion Technique (G. N Spokes and Dr. A G. Gaydon), 1114
Spectra (Infra-Red), of some Polypeptide and Protein Films : Optical Rotation and (Dr. A. Elliott, W. E. Hanby and B. R. Malcolm), 1340
Spectra (Molecular) : Excitation of, by Shock Waves (J. G. Clouston and Dr. A. G. Gaydon), 1342
Spectra (Ultra-Violet Absorption), of L-Ascorbic Acid in Aqueous Solutions (Dr. J. S. Lawendel), 434
Spectral Regions : Sensitivity of Light-inhibited Seeds to certain (N. Black and Dr. P. F. Wareing), 395
Spectrometric (Mass-) Assay of Elementary Nitrogen (Dr. J. B. Capindale and Dr. D. H. Tomlin), 701
Spectrometry : Relaxation (Prof. E. G. Richardson), *review* by Dr. P. Feltham, 1269
Spectroscopy : Some Recent Advances in (G. A Elliott), *erratum*, 122
  Interference (Centre National de la Recherche scientifique International Colloquium on), 955
Spectroscopy of the Natural Pigments (Photoelectric SpectrometryGroup and the Photobiology Group Joint Meeting on), 363
Spectroscopy (Differential Infra-red) : Identification of Edible Oils and the Detection of Oil Adulteration by (J. C. Bartlet), 1071
Spectrum (Band), of Gallium Hydride and Gallium Deuteride (H. Neuhaus), 433
Spectrum (Infra-red Solar) : Some Observations of the, from a High-flying Aircraft (J. T. Houghton, Dr. T. S. Moss, J. S. Seeley and T. D. F. Hawkins), 1187
Speech Production and Language Statistics (Dr. F. Goldman-Eisler), 1497
Speed of Application of Science : Industry and Technical Progress—Factors Governing the (Prof. C. F. Carter and Prof. R. B. Williams), *review* by Dr. R. Beeching, 301 ; 305
Spence, Dr. D H. N. : Hill Climate (Ecological Work on Plant Communities in Shetland, Rhum, the central Highlands, the Faroes and Iceland), 575
Spencer, B. : Biochemistry of Sulphur (Sulphatases), 466
Spencer, Dr. Herta, and others : Excretion of Yttrium and Lanthanum Chelates of Cyclohexane 1-2-*Trans* Diamine Tetraacetic Acid and Diethylenetriamine Pentaacetic Acid in Man, 919
Spencer-Silver, Dr. P. H. : Appointed to the readership in anatomy at Middlesex Hospital Medical School, 316
Sperber, Joan I. : Solution of Mineral Phosphates by Soil Bacteria, 994, *errata*, 1454
Sperling, H. G. : Visual Problems of Colour (Standard Colour Theory), 1397
Sperm (Homologous Testis or) : *In vitro* Demonstration of Uterine Anaphylaxis in Guinea Pigs sensitized with (Dr. Seymour Katsh), 1047
Sperm Whales : Underwater Sounds heard from (L. V. Worthington and William E. Schevill), 291
Spermatogenesis in *Drosophila melanogaster* : Mutagenic Response to the Alkyl-Methanesulphonates during (Dr. O. G. Fahmy and Dr. Myrtle J. Fahmy), 31
Spermatogenesis in the Mouse . Duration of (Dr. E. F. Oakberg), 1137, 1497 ; (Dr J L. Sirlin and Dr. R. G. Edwards), 1138
Spermatozoan Metabolism Carbon Dioxide as a Reversible Inhibitor of (Prof. G. W Salisbury and N. L. VanDemark), 989
Spermicidal Activity : The Biochemical Basis of (Dr. T. Mann), 1027
Sphering of Mammalian Red Cells : Quantity of Radioactive Lecithin and Radioactive Cephalin with Lipostol required to produce (Dr. Eric Ponder and Ruth V. Ponder), 814
Spicer, C. C. (edited by Williams, R. E. O., and) : Microbial Ecology—Seventh Symposium of the Society for General Microbiology, London, 1957, *review* by Dr S. D. Garrett, 351
Spiders (Trapdoor) : Adaptive Radiation of (Barbara Main), 277
Spiers, Prof. F. W. . A Code for Protection against Radiation, 578
Spiller, R. C. (Porter, Dr. M. W., and) : The Barker Index of Crystals, Vol. 2, Crystals of the Monoclinic System, Parts 1, 2 and 3, *review* by Dr F. C. Phillips, 821
Spinal Motoneurones : Intracellular Recording from, following Stimulation of Medullary Pyramids (Dr. Roger Merritt Morrell), 709
Spink, J. A. : High Polymer, Colloid and Surface Chemistry (Rate of Desorption of Radioactive Stearic Acid), 960
Spiral Crystals of Meconin (W. R. Logan), 1412
Spirogyra Cell-walls : New Crystallite Orientations of Cellulose I in (Dr. D. R. Kreger), 914
Spleen : Occurrence of a Cardio-active Principle in (L. B. Cobbin and Prof. R. H. Thorp), 242
Spleen (Mouse) : Chromatographic Characterization of Soluble Deoxypolynucleotides released in, by X-Irradiation (Dr. R. K. Main, L. J. Cole and M E. Ellis), 1285
Spleen and Liver of Rats : Influence of Post-Irradiation Administration of Methionine on the Levels of Deoxyribonucleic Acid in Bone Marrow, (M. K. Nerurkar, A. J. Baxi, N. S. Ranadive, M V. Narurkar and M. B. Sahasrabudhe), 193
Spleens (Tumour-immune) : Antitumour Effect of Culture Media from (E. Holečková and Dr. B. Sekla), 1298
Spokes, G. N., and Gaydon, Dr. A. G. : Absorption Spectra of Flat Flames using a Multiple-Reflexion Technique, 1114
Spontaneous Mutation-rate in Man : Gonad Temperature and (Dr. Lars Ehrenberg, Günter von Ehrenstein and Arne Hedgran), 1433
Spooner, R. J. . Appointed provincial agricultural officer, Kenya, 1098
Sporadic Meteors : Theory of the Annual Variation of (Tadayoshi Murakami), 1239
Sporangiophores (*Phycomyces*) : Phototropism of (M. J Carlile), 202
Sporendonema (R. L Edwards), 1374
Spores : Bacterial (Papers read at the Symposium on, to be published in an extra number of the *Journal of Applied Bacteriology*), 1098
Spores of Fungi in Air : Electrostatic Charges on (Prof. P. H. Gregory), 330
Spores (Germinating), in the Rhynie Chert (Dr. A. G. Lyon), 1219
Sporulation of *Peronospora tabacina* Adam. : Water-Relations and (I. A. M. Cruickshank and K. O Mueller), 44
Spreading of Liquid Metals on Solid Metal Surfaces : Wetting and (Department of Industrial Metallurgy, University of Birmingham, Joining of Metals Conference on), 72, 1156
Sprent, Mrs. Janet I., and Barber, Prof. H. N. : Leaching of a Flower Inhibitor from Late Varieties of Peas, 200
Sprouting of Stored Mangolds : Effect of Gamma Rays on the (C. E. Cornford and D. B Powell), 996
Spruce Wood (Sitka) : Effect of Exposure to Gamma-Rays on the Hygroscopicity of (J. M. Paton and R. F. S. Hearmon), 651
Spurway, Dr. H. : Hermaphroditism and Self-Fertilization, and the Monthly Extrusion of Unfertilized Eggs, in the Viviparous Fish *Lebistes reticulatus*, 1248
Squash Technique (An Acetocarmine), for the Fucales (Dr. Margaret Naylor), 46
Squirrel (Golden-mantled Ground), *Citellus lateralis* · Onset and Cessation of Hibernation under Constant Temperature and Light in the (Eric T. Pengelley and Prof. Kenneth C. Fisher), 1371
Sreenivasan, Prof. A., and others : Vitamin B_{12} and the Metabolism of Pyridine Nucleotides, 659
St. George's Hospital Medical School, London : Appointment of Dr. S. D. Elek to the chair of bacteriology, 316
St. Thomas Aquinas : The Christian Philosophy of (Etienne Gilson), translated by L. K. Shook, *review* by the Very Rev. W. R. Matthews, 873
Stability (Photochemical), of Dyes in the Solid State (Dr. G. S. Egerton and A. G. Roach), 1349
Stability (Thermal), of Collagen : Hydroxyproline and (Dr. D. A. Hall and Dr. R. Reed), 243
Stabilization : Voltage, *review* by Dr. G. N. Patchett, 1310
Stabilized Supplies : Voltage (Dr. F. A. Benson), *review* by Dr. G. N. Patchett, 1310
Stable Heavy Nuclides (Radioactive and) : Localization of, in Ocean Sediments (G. Arrhenius, M. N. Bramlette and E. Picciotto), 85
Stable Phosphorus Compound : Accumulation of a, in Glycolysing Insect Muscle (Václav Kubišta), 549
Stace-Smith, R., and Mellor, F. C. : Transmission of Raspberry Mosaic Viruses to the Strawberry, 172

Stacey, Dr. K. A. : Light-Scattering in Physical Chemistry, *review* by Dr. G. Allen, 5
Stacey, Prof M., and others : Characterization of 2-Amino-2-Deoxy-D-Altrose, 247
Stadie, Prof. W. C. : Awarded the Alvarenga Prize for 1957 by the College of Physicians of Philadelphia, 270
Staining Procedures : Morphological Changes of Tubercle Bacilli caused by (Prof. T. Ebina, C. Shinohara, H. Saito, K. Fukushi and J. Suzuki), 42
Stainsby, G. (Courts, A., and) : Recent Advances in Gelatin and Glue Research, 691
Stakman, Prof. E. C., and Harrar, J. George : Principles of Plant Pathology, *review* by F. C. Bawden, 1260
Stam, C. H. Netherlands Fellowship renewed for 1957-58 by the Ramsay Memorial Trust, 316
Stamm, Dr. O. A. (Zollinger, Dr. H., and) : Solvent Effects and Reaction Mechanism, 535
Stamp, Prof. L. Dudley : Conservation of Land, 687
  Geography in Japan, 899
Standard Deviation of Interatomic Distances in Benzene ; Molecular Vibrations and (Prof. O. Bastiansen and S J Cyvin), 980
Standard Terminology in Statistics : Towards a, *review* by W. Brass, 518
Standards Institution, British : Flammability of Apparel Fabrics in relation to Domestic Burning Accidents, 1102
Stanier, Prof. Roger Y., and others : The Microbial World, *review* by Dr. A. T. R. Mattick, 519
Stanley, Dr. R. G. : Tree Physiology (Reproduction in Pine), 78
Stanley, W. M. : The Origin of Life on the Earth (On the Nature of Viruses, Genes and Life), 868
Stannous or of Sodium Fluoride : Fluoride Removal by Powdered Dental Enamel from Solutions of (Dr. Frank A. Smith, Dwight E. Gardner, Dr. Samuel E. Leach and Dr. Harold C. Hodge), 1421
Stanwick Skull presented by the Society of Antiquaries to the British Museum (Natural History), 1027
Staphylococcal Toxin : Loss of Immunizing Power of, during Routine Toxoiding with Formalin (Dr. Stephen Fisher), 1479
Staphylococci (Antibiotic-Resistant) : Origin of (J. C. Gould), 282
Staphylococcus aureus : Simultaneous Synthesis of Two Inducible Enzymes in (Prof. H. H. Ramsey and T. E. Wilson), 761
Star 12 Lacertae (Variable) : Combined Light and Velocity Measurements of the (A. Abrami, G. Pakos, P. Broglia, B. Cester, J. F. Heard, M. Hack, M. Huruhata, C. de Jagers, J. Kubikovski, J. J. Kumsishvili, R. Lynds, N. L. Magalashvili, S. V. Nekrasova, G. J. Odgers, J. J. Ruiz, J. Sahade, H. J. Smith, M. J. Smyth, N. Thomas and M. Walker), 1112
Starch (Damaged) : Role of, in the Evaluation of Wheat Quality (L. H. Bird), 815
Starch (Potato) : Micelle Dimension of (Susumu Hizukuri and Ziro Nikuni), 436
Starch Gel Electrophoresis : Serum Protein Differences in Cattle by (G. C. Ashton), 917
Starch-gel Electrophoresis of Animal Sera (Dr. A. L. Latner and Angel Habib Zaki), 1366
Starch Gel Electrophoresis in a Discontinuous System of Buffers (Dr. M. D. Poulik), 1477
Stark, L. : Biological Rhythms (Nervous Disorders as manifestations of Inefficient Servo-mechanisms), 1101
Starkey, Dr. T. V. : Rheology of Disperse Systems (Theory of the Flow of Suspensions in Terms of Vorticity, Energy and Action), 958
Stars (Variable), in the Magellanic Clouds (M. W Feast), 229
Starvation and Glucose Load : Influence of, on the Activity of Liver Phosphorylase in Normal and Adrenalectomized Rats (Dr. N. Schwartz Sørensen), 857
Stationary Patterns (Regular) : Moving Visual Images produced by (Dr. D. M. MacKay), 849
Statistical Analysis of a Random, Moving Surface (Dr. M. S. Longuet-Higgins), 228
Statistical Mechanics : Thermodynamics and (Dr. A. H. Wilson), *review* by Dr. A. F. Devonshire, 724
Statistical Model (A Suggested), of some Time Series which occur in Nature (Dr. H. E. Hurst), 494
Statistical Society, Royal (Industrial Applications Section) : Conference on Production Control, 1239
Statistical Terms : A Dictionary of (Prof. Maurice G. Kendall and Dr. William R. Buckland), *review* by W. Brass, 518
Statistics at Birmingham, 119
Statistics in the University of Aberdeen, 1031
Statistics : Awards for Study in (University of Chicago), 688
  Towards a Standard Terminology in, *review* by W. Brass, 518
Statistics in Personnel Management : The Use of (Institute of Personnel Management and the National Institute of Industrial Psychology Course in), 220
Statistics (Forest Products) : Yearbook of, 1956 (Food and Agriculture Organization of the United Nations), 72
Statistics (Language) : Speech Production and (Dr. F. Goldman-Eisler), 1497
Status of *Moerisia lyonsi* Boulenger and related Hydroids (Dr. W. J. Rees), 445
Staveley, L. A. K. (Morlee, R. G. S., and) : Dependence of Heat Capacity of certain Crystals on their Thermal History, 1246
Staveley, L. A. K. (Pool, R. A. H., and) : Excess Volumes in Binary Liquid Mixtures of Simple Molecules, 1118
Steacie, Dr. E. W. R. : Our Debt to the Future (The Social Impact of Modern Technology), 259
Steadman, R., and Youell, Dr. R. F. : Crystallography and Thermal Transformations of Cronstedtite, 1066
Steam—Water Mixtures : Flow of, at High Pressures (R. W. Haywood), 357
Stedman, Dr. E., and others : Amino-Acid Composition of the Six Histones of Calf Thymocytes, 1107
Steel, Dr. Robert, and Walker, Dr. Thomas K : Formation of β-1,4-Oligoglucosides by certain *Acetobacter* Species, 201
  A Highly Specific Growth-Inhibitory Factor produced by certain *Acetobacter* Species, 811
Steel : The Mechanism of the Formation of Banded Structures in (Prof. Paul Bastien), 787
  Réaumur, on, *review* by Prof. F. C. Thompson, 1263
Steel and Iron : Memoirs on (R. A. F. de Réaumur), a translation from the original printed in 1722, by Anneliese Grunhaldt Sisco, *review* by Prof. F. C. Thompson, 1263
Steel Castings Research Association, British : New Research Station (Dr. A. H. Sully), 221
Steel Castings Research Association, British, and the Steel Founders' Society of America : Arrangement for the exchange of information, 218
Steel Founders' Society of America (British Steel Castings Research Association and the) : Arrangement for the exchange of information, 218
Steel Industry (Iron and) : Water Pollution in the (Iron and Steel Engineers Group Discussion on), 893
Steele, John H. : Researches in Marine Biology (Water Samples from the Fladen grounds in the North Sea), 746
Steels : Softening of, by Cold-Working (P. Chollet and H. P. Tardif), 754
Steels (Hardened 1 per cent Carbon) : Variation of Elastic Constants of, on Tempering (A. F. C. Brown, A. G. Cole and M. F. Markham), 1254
Steenberg, Prof. B · Fundamental Aspects of Fibres and their Treatment for Papermaking (Bonded-Fibre Assemblages—Relationship between Beating and the Mechanical Properties of Paper), 1177 ; (Process of Beating), 1177
Steffensen, Dale : Dwarf *Drosophila* produced by Ethylene Diamine Tetraacetic Acid—a Relationship to Chelation of Zinc, 390
Stein, Dr Gabriel, and others : Action of Blue Light on the Germination of Seeds, 609
Stein, W. H. . Protein Structure and Biological Activity, 833
Steinberg, G., and others : Bibliography for 1953 and 1954 of Syntheses of Compounds containing Carbon Isotopes, 636
Steiner, Dr. E. H : Rheology of Disperse Systems (Viscosity Measurements), 958
  Quality Control of Food (Statistics—Three Main Sources of Error), 1326
Stellar Energy and Stellar Evolution (Prof. T. G. Cowling), 479
Stellar Evolution · Stella Energy and (Prof. T. G. Cowling), 479
Stems (Pea) : Relationship between Shoot Apex and Effect of Gibberellic Acid on Elongation of (A. J. Vlitos and W. Meudt), 284
Step (Missing), in Man, Monkey and Guinea Pig required for the Biosynthesis of L-Ascorbic Acid (Dr. J. J. Burns), 553
Stepanov, A. V. (Klyavin, O. V., and) : Low-Temperature Physics (Mechanical Properties of Metals at Liquid-Helium Temperatures), 461
Stephen, Dr. M. J. : General Fellowship renewed for 1957-58 by the Ramsay Memorial Trust, 316
Stephen, Dr. W. I. : Appointed lecturer in chemistry at the University of Birmingham, 122
Stephens, G. C. · Biological Rhythms (Homoeostatic Mechanics of Rhythms), 1101
Stephens, P. H., and others : Effect of Oxygen on the Carrier Life-time in Silicon, 665
Stereochemistry, *review* by Dr. P. B. D de la Mare, 822
Steric Effects in Organic Chemistry (edited by Melvin S. Newman), *review* by Dr. P. B. D. de la Mare, 822
Sterile Liquid Medium : A Technique for Obtaining Clone Cultures of Soil Amoebae in (D. Harrison), 1301
Sterkfontein : Occurrence of Stone Artefacts with *Australopithecus* at (Dr. J. T. Robinson and R. J. Mason), 521
Sterling (Louis) Premium of the British Institution of Radio Engineers awarded to Dr. A. van Weel, 529
Sterne, L. H. G. : Royal Aircraft Establishment, Bedford, 775
Steroids in Pharmacy and Medicine (Dr. G. I. M. Swyer), 641
Steudel, A. : Interference Spectroscopy, 956
Steven, Prof. D. M. : Elected president of the Association of Island Marine Laboratories, 466
Stevens, Dr. B. : Appointed lecturer in physical chemistry at the University of Sheffield, 893
Stevens, Dr. G. W. W. : Microphotography—Photography at Extreme Resolution, *review* by Dr. R. Barer, 622
Stevens, H. M. : Trace Elements in Soils, Plants and Animals (Paper Chromatography in the separation of Valency States of Biologically Important Metals), 24
Stevens, Raymond, and others (edited by) : A Scientific Sampler, *review* by T. H. Hawkins, 209
Stevenson, Prof. A. C., and McClarin, R. H. : Determination of the Sex of Human Abortions by Nuclear Sexing the Cells of the Chorionic Villi, 198
Stevenson, D. T., and others (edited by R. H. Kingston, with the assistance of) : Semiconductor Surface Physics—Proceedings of the Conference on the Physics of Semiconductor Surfaces, Philadelphia, 1956, *review* by Dr. J. R. Tillman, 675
Stewart, Rosemary : Management Organization, *review*, 621
Stiles, Prof. W. : Photosynthesis, 1083
Stiles, Dr. W. S. : Colour Vision, 1395
Stimulant : A Plain-muscle, in the Menstruum (Dr. W. R. Pickles), 1198
Stimulation : Responses of *Cerianthus* to (Dr. D. M. Ross), 1368 ; (Dr. G. A. Horridge), 1369
Stimulation of Medullary Pyramids : Intracellular Recording from Spinal Motoneurones following (Dr. Roger Merritt Morrell), 709
Stimulation of Sclerotium Germination in *Sclerotium cepivorum* Berk. (J. R. Coley-Smith and Dr. C. J. Hickman), 445
Stimulation (Regular Patterned) : Some Further Visual Phenomena associated with (Dr. D. M MacKay), 1145
Stimuli in Coral Polyps : Co-ordinated Response to (Dr. N. B. Eales), 421
Stimuli (Light) : Changes in Response to, of the Larvae of *Culicoides circumscriptus* (Dr. P Becker), 559
Stimuli (Trophic) : Transmission of, along Developing Nerve Fibres (Dr. Arthur Hughes and Pierre André Tschumi), 999
Stirling, P. H., and Cowan, C. B. : Gas Chromatography (Factors affecting the Selection of Thermistors for Use in Katharometers), 841
Stober, Alfred K, and others : Suppression of Bubbling in Boiling Refrigerants, 1413
Stock Lines of Human Carcinoma Cells : Contamination of, by Pleuropneumonia-like Organisms (Dr. L. H. Collier), 757
Stocker, R. B. D. : Taste and Smell, 275
Stocks, Dayna L., and others : Chromatography of Tobacco Mosaic Virus on a Cellulose Cation Exchange Adsorbent, 1281
Stoerk, Dr. H. C., and others : Antimitotic Activity of 5-Tertiary Butyl Benzimidazolone, 1428
Stoker, Prof. H. C. : *Apartheid*, 686
Stokesian Region : Distortion of Fluid Drops in the (Prof. F. H. Garner, K. B. Mathur and V. G. Jenson), 331

Stolte, L. A. M., and others : The Sex-linked Difference in Rabbit Neutrophils, 554
Stolten, Hans J. (Siggia, Sidney, and) : An Introduction to Modern Organic Analysis, review by Dr. G. M. Bennett, 6
Stomata : Midday Closure of—Temperature Effects on the Minimum Intercellular Space Carbon Dioxide Concentration 'Γ' (Dr. O. V. S. Heath and Dr. B. Orchard), 180 ; Effects of Carbon Dioxide and Temperature on Stomata of *Allium cepa* L. (Dr. O. V. S. Heath and H. Meidner), 181
Stomata of *Allium cepa* L. : Effects of Carbon Dioxide and Temperature on (Midday Closure of Stomata), (Dr. O. V. S. Heath and H. Meidner), 181
Stommel, Dr. H. : The Abyssal Circulation of the Ocean, 733
Stone, D. J. : Appointed lecturer in mathematical statistics at the University of Exeter, 1239
Stone, Dr. E. C. : Tree Physiology (Water Relations of Trees), 77 ; (Seed Dormancy in various species of Pine), 78
Stone, Dr. F. S. (Allen, R. L., and) : Nature of the Product condensed at Low Temperatures from Dissociated Peroxide Vapour, 752
Stone Artefacts with *Australopithecus* at Sterkfontein : Occurrence of (Dr. J. T. Robinson and R. J. Mason), 521
Stoner, C. R. : Transmission-Line Theory, *review*, 1443
Stones ? : What Mean These—the Significance of Archaeology for Biblical Studies (Prof. Millar Burrows), *review* by M. C. Burkitt, 1255
Storage of Methylcellulose : Effect of, on Blood Protein Formation in the Rat (Margaret M. Frohlich, V. Balázs and S. Benko), 1474
Stored Mangolds : Effect of Gamma Rays on the Sprouting of (C. E. Cornford and D. B. Powell), 996
Stormer, Prof. Carl : *Obituary* by Prof. Sydney Chapman, 633
Stothert Research Fellowship of the Royal Society awarded to Dr. M. J. R. Dawkins, 119
Strain : Properties of Materials at High Rates of (Institution of Mechanical Engineers Conference on), 584
Strain Distribution in Metals : Study of, by the Determination of Local Electrode Potentials (Prof. Hugh O'Neill and Dr. D. Eurof Davies), 498
Strain—Age Hardening and Brittleness in Chromium (C. W. Weaver), 806
Strains in Species of Schistosomes : Possible Occurrence of (B. Verdcourt), 865
Strains of *Streptomyces* : Cytochrome Composition of some (Allen H. Heim, Dr. Warren S. Silver and Yehudith Birk), 608
Strange, R. E. (Dark, F. A., and) : Bacterial Protoplasts from *Bacillus* Species by the Action of Autolytic Enzymes, 759
Strategy of Research (Sir George Thomson), 1223
Stratigraphic Profile of Chalk at Flamborough, Yorkshire : Velocity of Compressional Waves for a (Dr. A. S. Laughton and A. H. Stride), 977
Stratton, Dr. F. : An Introduction to Blood Group Serology, *review*, 675
Stratton, G. B. (edited by) : The Zoological Record, Vol. 91, Being the Records of Zoological Literature relating chiefly to the Year 1954, *review* by Dr. Edward Hindle, 935
Stratton, G. B. (compiled by Townsend, A. C., and) : Library Resources in the Greater London Area, No. 6, Zoological Libraries, 70
Stratton's *Festschrift*, *review* by Prof. André Danjon, 1308
Strauss, Dr. H. J. : Taste and Smell, 275
Strawberry : Florigenic Hormone in the (C. Sironval), 72
    Transmission of Raspberry Mosaic Viruses to the (R. Stace-Smith and F. C. Mellor), 172
Streams and Rivers : Lamprey Distribution in (Dr. E. W. Baxter), 1145
Strehler, Bernard (Chance, Prof. Britton, and) : Effects of Oxygen upon Light Absorption by Green Algae, 747
Strelkov, P. G., and Kalinkina, Miss I. N. : Low-Temperature Physics (Specific Heat of Bismuth), 461
Strength of High Solids Pectin Gels : Relationship of the, to the Concentration and Jelly-forming Capacity of the Pectin Present (Dr. Peter Wade), 1067
Strength of Highly Porous Brittle Materials (K. Schiller), 862
Streptococci (Group A) : Enhancement of Mouse-virulence of (J. Cameron), 1136
Streptococcus pluton (*Bacillus pluton* White) and *Bacterium eurydice* White : European Foul Brood—a Disease of the Larval Honeybee (*Apis mellifera* L.) caused by a Combination of (L. Bailey), 1214
Streptomyces : Cytochrome Composition of some Strains of (Allen H. Heim, Dr. Warren S. Silver and Yehudith Birk), 608
Streptomyces sp. : Production of Sclerotic Granules by (Dr. M. L. Gattani), 1293
Streptomyces rimosus : Recombinations in (S. I. Alikhanian and S. Z. Mindlin), 1208
Stress : Effect of, on Hole Formation during the Diffusion of Zinc from Brass *in vacuo* (Dr. L. M. T. Hopkin), 808
Stress (Cyclic) : Grain-Growth in Metals by (Prof. H. Okubo and N. Nozaki), 604
Stride, A. H. (Laughton, Dr. A. S., and) : Velocity of Compressional Waves for a Stratigraphic Profile of Chalk at Flamborough, Yorkshire, 977
Striga hermonthica Benth. (Witchweed), in the Sudan Gezira : Control of (S. A. J. Tarr), 1143
Stringer, J., and Haley, K. B. : Operational Research (Work to reduce the Cost of Transport of Coal to Power Stations), 1088
Striving for Rigour in Greek Science (Prof. C. Lanczos), 843
Strøm, Prof. Kaare : A Lake with Trapped Sea-Water ?, 982
Strom, R., and others : Oxidation of Pentane in Mixtures with Air and the Negative Temperature Coefficient of Reaction, 335
Strong, John : Re-elected vice-president of the Institute of Welding, 122
Strontium (Radioactive) : Rate of Entry of, into Plants from Soil (Dr. R. Scott Russell and G. M. Milbourn), 322
Strontium-90 : Distribution of, in Pond Weed and Fish (K. W. E. Bidwell and Eileen E. Foreman), 1195
Stroup, E. D. : The Abyssal Circulation of the Ocean, 733
Structural Degradation : Role of, in the Loss of Serological Activity of Ovalbumin irradiated with Gamma-Rays (Hugo Fricke, Charles A. Leone and Wendell Landmann), 1423
Structural Heterozygosity of *Cipura paludosa*, Aubl. (Dr. Arun Kumar Sharma and Miss Chitra Talukdar), 662
Structure : A New Metallic Layer (J. F. de Wet), 1412
Structure of Brain Ganglioside (Dr. Samuel Bogoch), 197
Structure of Carbon during Oxidation : Changes in the (J. D. Watt and Dr. Rosalind E. Franklin), 1190
Structure of the Crust under the Eastern Mediterranean Sea (J. Cl. De Bremaecker), 755
Structure of 2,4-Dichlorophenoxyacetate : Relation of, to its Mode of Action as an Auxin (Emmett J. Johnson and Prof. Arthur R. Colmer), 1365
Structure of the Fermi Surface : Band Theory of Metals and the (Physical Society Conference on), 893, 1172
Structure of the Galaxy : The Large-Scale (F. J. Kerr, J. V. Hindman and Martha Stahr Carpenter), 677
Structure of Graphites (Prof. P. L. Walker, Jun., and George Imperial)—Interlayer Spacings of Graphitic Carbons, 1184 ; Graphitic Character of Kish, 1185
Structure of the Liquid-Crystal Phases of the Soap—Water System—Middle Soap and Neat Soap (Dr. V. Luzzati, H. Mustacchi and A. Skoulios), 600
Structure of Matter : Thermodynamics and the, *review* by Dr. A. F. Devonshire, 724
Structure of Molluscan Tropomyosin (Dr. Jean Hanson, Dr. J. Lowy, Dr. H. E. Huxley, K. Bailey, C. M. Kay and J. C. Ruegg), 1134
Structure of a New Pyridine Nucleotide isolated from *Penicillium chrysogenum* (Giovanni Serlupi-Crescenzi and Alessandro Ballio), 1203
Structure of Non-porous Anodic Films on Aluminium (R. W. Franklin), 1470
Structure in Organic Chemistry : Introduction to (Prof. C. K. Ingold), *review* by G. Fowles, 453
Structure of Smooth Muscles (Dr. Jean Hanson and Dr. J. Lowy), 906
Structure of *d*-Urobilin (Prof. C. H. Gray and Dr. D. C. Nicholson), 336
Structure (Crystal), of Calcium Monoaluminate (Maryon W. Dougill), 292
Structure (Crystal), of Oximes (Bodil Jerslev), 1410
Structure (Earth's) : A Geochemical Hypothesis of the (A. F. Kapustinsky), 1245
Structure (Internal), of the Virus-like Particles associated with the Rous Sarcoma, and their Presence in other Neoplastic and Normal Chicken Tissues (Prof. Ch. Oberling, W. Bernhard and Ph. Vigier), 386
Structure (Molecular) : The Glass Scratch Effect and (Dr. J. Bourdillon), 1475
    Valency and (E. Cartmell and Dr. G. W. A. Fowles), *review* by Prof. J. R. Partington, 109
Structure (Protein), and Biological Activity—Paris Symposium (Dr. Kenneth Bailey), 833
Structure Determination (Direct), by Optical-Transform Methods (M. M. Crowder, K. A. Morley and Dr. C. A. Taylor), 431
Structure and Function (Biological) : Enzymes—Units of (edited by Oliver H. Gaebler), *review* by Prof. D. D. Woods, 1379
Structure and Functioning of the Nervous System (British Association for the Advancement of Science, Section D (Zoology), Symposium on), 1388
Structures : Atomic, *review* by Dr. R. J. Eden, 822
Structures (Atomic) : The Calculation of (Prof. Douglas R. Hartree), *review* by Dr. R. J. Eden, 822
Structures (Banded), in Steel : The Mechanism of the Formation of (Prof. Paul Bastien), 787
Structures (Basal), in the Insect Ovipositor : Reinterpretation of some (G. G. E. Scudder), 340
Structures (Crystal), of Silicon Nitride (D. Hardie and Dr. K. H. Jack), 332
Structures (Liquid-Crystalline), in Polypeptides (Dr. Conmar Robinson and J. C. Ward), 1183
Strychnine : Kopsine and—a Comparative Study of their Physiological Properties (Dr. S. R. Mukherjee, Ajit Maiti and P. K. Dey), 916
Stuart, A. : Appointed to the newly created chair of geology in the University of Exeter, 1239
Stuart, R. D. (Arguimbau, L. B., and) : Frequency Modulation, *review* by Dr. R. L. Smith-Rose, 206
Stuart-Harris, Prof. C. H. : Appointed a member of the Medical Research Council, 637
Students of Pharmacy and Biology : Physical Chemistry for (Dr. S. C. Wallwork), *review* by G. Fowles, 1269
Students (Medical) : Training of, 205
Studentships (Research), for Postgraduate Training in Ecology (Nature Conservancy Awards for 1957), 467
Studies of Bacteria : A General Theory of Membrane Transport from (Dr. Peter Mitchell), 134
Studies on Fertility, including Papers read at the Conference of the Society for the Study of Fertility, Birmingham, 1955 (edited by Prof. R. G. Harrison), *review*, 1267
Study of the Fauna of the Soil : International Group for the, 218
Study of Laboratory Populations of *Drosophila* : A New Technique for the (J. A. Thomson), 1495
Study Abroad : Scholarships for (British Council), 1325
Study of Fertility, Society for the : Seventh Annual Conference, 226
    First Oliver Bird Lecture (Dr. T. Mann), 1027
    Proceedings, Vol. 7, Studies on Fertility, including Papers read at the Conference at Birmingham, 1955 (edited by Prof. R. G. Harrison), *review*, 1267
Study of the Magnetic Leakage Field in Cobalt by means of a Divergent Electron Beam (Dr. M. Blackman and E. Grunbaum), 1189
Study of Nucleic Acids : Fluorescence Microscopy in the—Histochemical Observations on Cellular and Virus Nucleic Acids (Dr. J. A. Armstrong and Dr. Janet S. F. Niven), 1335 ; Visual Observation of Deoxyribonucleic Acid Changes in Bacteria during Growth of Bacteriophage (Dr. E. S. Anderson), 1336
Study in Statistics : Awards for (University of Chicago), 688
Study (Advanced), in the Behavioral Sciences, Center for (Stanford, California) : Conference on Ethology and Comparative Psychology, 362
Study and Travel in the United States : Fellowships for (Commonwealth Fund, New York), 585
Studying the Microbiology of Soils : Methods of (Symposium at the University Institute of Agronomy, Louvain), 591
Sturley, Dr. K. R. : Engineering Training in the B.B.C., 537
Stylar Amputation : Successful Crossing in the Genus *Lathyrus* through (A. J. S. Davies), 612
Subbarao, K., and Ramachandra Rao, Dr. B. : A Simple Method of Determining Ultrasonic Velocities in Rocks, 978

Subendothelial Space between the Ovarian Interstitial Cell and the Endothelial Lining of the Blood Sinusoids (Dr. M. De Groodt, A. Lagasse and Prof. M. Sebruyns), 1431
Submarine Mountain in the Pacific Ocean : A New (I. V Sergeev and G. B. Udintzev), 530
Submerged Leaves : Water Absorption by (T. R. Milburn), 1368
Substances other than Intrinsic Factor : Enhancement of Vitamin B_{12} Absorption by (Samuel M. Greenberg, John F. Herndon, Edward G. Rice, Edwin T. Parmelee, John H. Gulesich and Edward J. Van Loon), 1401
Substrate of Enzymic Browning in Cacao : Detection of the, by a Post-chromatographic Enzymatic Technique (Dr. L A Griffiths), 1373
Successful Crossing in the Genus *Lathyrus* through Stylar Amputation (A. J. S. Davies), 612
Sucrose Crystals : Growth of (N Albon and Dr. W. J. Dunning), 1348
Sudan Gezira : Control of Witchweed, *Striga hermonthica* Benth., in the (S. A. J Tarr), 1143
Sudovtsov, A. I. (Lazarev, B G , and) : Low-Temperature Physics (Volume Change in Tin and Lead when Superconductivity is established in a Magnetic Field), 461
Sugar Industry in the South Pacific, *review* by Sir Harold Hartley, 1378
Sugar Refining Company, Ltd. South Pacific Enterprise—the Colonial (edited by A. G. Lowndes), *review* by Sir Harold Hartley, 1378
Sugar Research in Mauritius, 218
Sugar (New Aldoheptose) : Natural Occurrence of a (Dr. D. A. L. Davies), 1129
Sugar-Beet Nematode, *Heterodera schachtii* Schmidt . Chromosome Number in the (Roland H. Mulvey), 1212
Sugars (Aldoheptose) · *Pasteurella septica*—the Occurrence of Type-Specific Polysaccharides containing (A. P MacLennan and C. J. M. Rondle), 1045
Suggested Statistical Model of some Time Series which occur in Nature (Dr. H. E. Hurst), 494
Suid Material (Fossil), recovered from the Florisbad Deposit (R. F. Ewer), 1393
Sullivan, Maurice F., and Thompson, Dr. Roy C Absence of Lethal Radiation Effects following Massive Oral Administration of Plutonium, 651
Sully, Dr. A. H. . British Steel Castings Research Association—New Research Station, 221
Sulphate (Barium), in Fungi and Algae · X-Ray Interferences of (Dr. D. R. Kreger), 867
Sulphate (Sodium Octyl), in Saturated Salt Solutions . Surface Properties of (E Matijević and J. Rogers), 560
Sulphate (Triglycine), a New Ferroelectric Material (Bell Telephone Laboratories, New York), 19
Sulphone in the Affected Tissues of Leprosy Patients : Autoradiographic Detection of (R. K. Poddar and Dr. K. R. Chatterjee), 854
Sulphonylureas and related Compounds : The Effects of the, in Experimental and Clinical Diabetes (New York Academy of Sciences Conference on), 584
Sulphydryl Content and Formazan in the Tissues of the Pea Radicle : A Quantitative Comparison of (B. Jámbor, M. Dévay and Dr. L W. Roberts), 997
Sulphur : Biochemistry of (Colloquium at Roscoff, 1956), 466
Sulphur Dioxide (Liquid) : Reaction of Nitrates with (Dr. K. J. Ivin), 90
Summer, Dr. J. F., and others · Initiation and Growth of Explosion in Solids (Ignition cf Primary Explosives by Electric Discharges), 74
Summer Cauliflower (Early) : Blindness in (Dr. P. J Salter), 1056
Summer School for undergraduates of all faculties (Universities Federation for Animal Welfare), 172
Sumner, W. L . Science and its Background, *review*, 1267
Sun : Highway of the (Victor W. von Hagen), *review* by Dr G. H S. Bushnell, 1443
  Once round the—the Story of the International Geophysical Year, 1957-58 (Dr Ronald Fraser), *review* by Dr. M A. Ellison, 623
  Radio Pictures of the (W. N. Christiansen, D S. Mathewson and J. L. Pawsey), 944
Sunspots : Measurements of (Winifred Sawtell Cameron), 687
Sunspots during November-December 1956, 687
Supercontraction of Wool Irradiated with Ultra-violet Light or Iodinated (A. R Haly, M Feughelman and June C. Griffith), 1064
Supply, Ministry of (Royal Radar Establishment, Malvern) : International Symposium on Electronic Components, 531
  Further Radio Observations of the First Satellite, 944
Supply, Ministry of (Staff of the Royal Radar Establishment, Malvern) : The 45-ft. Radio Telescope of the Royal Radar Establishment, Malvern, 1225
Supply of Scientists and Technologists for Industry (Dr. P. F. R. Venables), 305
Supply of Trained Men and Women (British Association for the Advancement of Science Conference on), 305
Supply and Training of Teachers for Technical Colleges (Ministry of Education), 53
Supposed Asexual Reproduction in Trilobites (Dr Henning Lemche), 801
Suppression of Bubbling in Boiling Refrigerants (Dr. G J. Minkoff, Floyd I. Scherber and Alfred K. Stober), 1413
Surange, S L. : Appointed by the Royal Society as Rutherford Scholar at the Royal Society Mond Laboratory, Cambridge, 119
Surface (Random, Moving) . Statistical Analysis of a (Dr. M. S. Longuet-Higgins), 228
Surface Activity (Dr. J. H. Schulman), 225
Surface-active Agents (Anionic) : Relationship between the Concentration of, and the Electrophoretic Mobility and Viability of *Aerobacter aerogenes* (Dr D. E E. Loveday and Dr. A. M James), 1121
Surface Alteration and the Agglutinability of Red Cells (Prof. Merwin Moskowitz and Saul Carb), 1049
Surface Chemistry : High Polymer, Colloid and (South Australian Branch of the Royal Australian Chemical Institute Discussion on), 959
Surface Electroluminescence Effect in Diamonds (Dr. H. F. Logie and R. R. Urlau), 1254
Surface Physics : Semiconductor—Proceedings of the Conference on the Physics of Semiconductor Surfaces, Philadelphia, 1956 (edited by R. H. Kingston, with the assistance of E. Burstein, A. L. McWhorter, P. H Miller, Jr., D. T. Stevenson and P. B. Weisz), *review* by Dr. J. R. Tillman, 675
Surface Properties of Sodium Octyl Sulphate in Saturated Salt Solutions (E. Matijević and J. Rogers), 560
Surface Water Year-Book of Great Britain, 1954-55 (Ministry of Housing and Local Government and Scottish Office), 223
Surfaces (Leaf) . Electron Microscopy of (D. E. Bradley and B E. Juniper), 330
Surgeons of England, Royal College of : Golden Jubilee Celebration, 893
Survey Department, Kenya : Appointment of J. G. Olliver as technical officer, 688
Surveys Department, Northern Rhodesia : Appointment of P. W. M Allin as surveyor-general, 21
Survival of Human Circulatory Leucocytes *in vitro*—Life-span and Nucleic Acid Turnover (Dr. J Malec and Dr. K. Zakrzewski), 551
Survival (Red-Cell), in Familial Haemolytic Anaemias (Dr. Robert L. Evans), 1435
Surviving Rat Skin Grafts in Mice (O Brocades Zaalberg, O Vos and D. W. van Bekkum), 238
Susceptibility of the Hedgehog (*Erinaceus europaeus*) to Infection with *Leptospira pomona* (Dr. W. Maurice Webster), 1372
Sutcliffe, Dr J. F. . Appointed to the University of London readership in botany at King's College, 220
Sutcliffe, Dr. J F , and Hackett, D. P. : Efficiency of Ion Transport in Biological Systems, 95
Sutcliffe, Dr. J. F. (Hurd, R. G., and) An Effect of *p*H on the Uptake of Salt by Plant Cells, 233

Trecanni, Prof V.. Methods of Studying the Microbiology of Soils, 591
Tredre, Dr R. Ford: Pasteur Institute of Southern India, 590
Tree Physiology (Symposium sponsored by the Maria Moors Cabot Foundation), 77
Trees: British (Miles Hadfield), *review* by Dr. N. L Bor, 59
Seven (Edna Johnson), *review*, 676
Treiman, S B, and others (compiled and edited by). High Energy Nuclear Physics—Proceedings of the Sixth Annual Rochester Conference (1956), *review* by Sir John Cockcroft, 303
Treloar, F. E. High Polymer, Colloid and Surface Chemistry (Polymerization of Styrene in Solution in Carbon Tetrachloride and Catalysed by Aluminium Chloride), 960
Treloar, Dr L. R G: Rheology of Elastomers (Equilibrium Properties of Rubberlike Materials), 75
Trevelyan Scholarships, 1394
Trevett, M. E (Cookson, Prof R. C., and): Recent Advances in the Chemistry of Terpenoid Compounds (Delpheline), 471
Trewavas, Dr E.: Eels, *review*, 350
Triassic Times (Upper), in the United States: The Geomagnetic Field in (P M Du Bois, E. Irving, N D Opdyke, Prof. S K Runcorn and M R Banks), 1186
s-Triazine Herbicides: New (Dr. H. Koopman, J. H. Uhlenbroek and J Daams), 147
Tribal Government, *review* by Dr A L. Epstein, 1442
Tribal Societies: Government and Politics in (Prof. I Schapera), *review* by Dr. A. L Epstein, 1442
Tribunals and Enquiries Administrative Report of the Committee on, 819
House of Commons Debate on, 1178
Tribute to Frederick Soddy (Prof F. A. Paneth), 1085
Trichloracetate (Ethyl): Lipotropic Action of (Dr. C. C Kratzing and Dr. G. M. Windrum), 859
Trichonympha turkestanica Bernstein (Trichonymphina, Trichonymphidae): Cytochemical Localization of Acid Phosphatase in (M. M. El Mofty), 1367
Triethanolamine: A Physiological Effect of, on the Development of *Sclerotium rolfsii* (Sacc.), (S. Lavee), 1494
Triethylenemelamine Induction of Translocations in Mice by (B M. Cattanach), 1364
Trifluoride (Boron) Complex Formation: Nuclear Magnetic Resonance Studies of (P Diehl and R A Ogg, jun.), 1114
Trifolium repens L. and *Medicago sativa* L.: Electrical Determination of Cold Hardiness in (C. G. Greenham and H. Daday), 541
Triglycine Sulphate, a New Ferroelectric Material (Bell Telephone Laboratories, New York), 19
Trikojus, Prof. V. M. Re-elected president for 1957-58 of the Australian Biochemical Society, 170
Trilobites Supposed Asexual Reproduction in (Dr. Henning Lemche), 801
Trinity College, Cambridge: Entrance Exhibitions, 1239
Trinity College, Dublin: Retirement of Prof. John Purser from the chair of civil engineering, 464
Appointment of Dr. W. Wright to the chair of civil engineering, 464
Triphosphate (Adenosine) Relationship between the Hydrolysis of, and Oxidative Phosphorylation (W C. Hulsmann and Prof. E. C. Slater), 372
Triphosphopyridine Nucleotide as a Catalyst of Photosynthetic Phosphorylation (Prof. Daniel I. Arnon, Dr. F R. Whatley and Dr M B. Allen), 182, *errata*, 1325

Triphosphoric Acid (Adenosine) : The Free Energy of Hydrolysis of (G. E. Vladimirov, V. G. Vlassova, A. Y. Kolotilova, S. N. Lyzlova and N. S. Pantereyeva), *erratum*, 363
Triplet State : Interactions of Chlorophyll in its, with Oxygen, Carotene, etc. (Dr. E. Fujimori and Prof. Robert Livingston), 1036
Tristram, G. R. : Research on Gelatin and Glue, 690
Triterpenoidal Saponins : Fractionation of Isolated Lucerne and other (Dr. C. B. Coulson), 1297
Tritium : A Convenient Method for Labelling Biologically interesting Carboxylic Acids with (N. P. Buu-Hoï), 385
Tromp, Dr. S. W. : Biological Rhythms (Possible Importance of Seasonal Climatic Factors on Asthma Attacks and Mental Symptoms), 1101
  Bioclimatology and Biometeorology (Ionization of the Atmosphere), 1328
Trophic Stimuli : Transmission of, along Developing Nerve Fibres (Dr. Arthur Hughes and Pierre André Tschumi), 999
Tropical Medicine in London (1899-1949) : History of the School of (Sir Philip Manson-Bahr), *review* by Prof. T. H. Davey, 205
Tropical Metabolism Research Unit of the Medical Research Council, University College of the West Indies : Dried Lanterns from Fireflies (*Photinus pallens*), 1454
Tropical Products Institute : New name for the Colonial Products Laboratory, 1393
Tropics : A Difference in the Physiology of the Large Intestine between European and Indigenous Cattle in the (Dr. J. Quarterman, G. D. Phillips and G. H. Lampkin), 552
Tropomyosin (Molluscan) : Structure of (Dr. Jean Hanson, Dr. J. Lowy, Dr. H. E. Huxley, K. Bailey, C. M. Kay and J. C. Ruegg), 1134
Trott, Dr. N. G. : Radiation and Biology (Radioactivity—its Hazards and Benefits to Health), 629
Trowell, O. A. : Behaviour and Fate of Lymphocytes (Formation and Disintegration of Lymphocytes in Rat Lymph Nodes cultured *in vitro*), 1016
True- and Pseudo-Enzyme : Insensitivity of Chicken Cholinesterase to Specific Inhibitors of (Prof. W. Ferrari), 144
Truelove, B. : Appointed junior research fellow in botany at the University of Sheffield, 21
Trueman, E. R. : Mucous Gland Cells of the Outer Mantle Epithelium of *Arca noae*, 1492
Trypanosomiasis (Human) : Polymorphism in (Dr. D. J. B. Wijers), 391
Tschoegl, N. W. : High Polymer, Colloid and Surface Chemistry (Techniques of Surface Chemistry), 960
Tschumi, Pierre André (Hughes, Dr. Arthur, and) : Transmission of Trophic Stimuli along Developing Nerve Fibres, 999
Tsukada, Yasuzo (Takagaki, Genkichiro, and) : Sodium Ions and Tissue Metabolism—some Metabolic Peculiarities of Brain Tissue, 707
Tsunamis (J. Darbyshire and S. Ishiguro), 150
Tsuru, Daisuke, and others : Effects of Carbon Sources and Base Analogues of Nucleic Acid on the Formation of Bacterial Amylase, 438
Tube Diameter : Effect of, on the Pressures in Gaseous Detonation Waves (Dr. D. H. Edwards and G. T. Williams), 1117
Tubercle Bacilli : Morphological Changes of, caused by Staining Procedures (Prof. T. Ebina, C. Shinohara, H. Saito, K. Fukushi and J. Suzuki), 42
Tuberculosis : Dorothy Temple Cross Research Fellowship in (Medical Research Council Award for 1957-58), 315
Tucker, Prof. D. G. : Arrays with Constant Beam-Width over a Wide Frequency-Range, 496
Tucker, Dr. G. B. : Planetary Atmospheres and Convection in Rotating Fluids (Transfer Processes in Planetary Atmospheres), 1457
Tumour (Ehrlich Ascites) : How does the, obtain its Energy for Growth ? (A. Kemp and Prof. B. Mendel), 131
Tumour Cells : Distribution of Ribonucleic Acid in, during Mitosis (Dr. Robert Love), 1338
Tumour Cells (Ascites), in Mice : A Diurnal Cycle in the Mitotic Activity of (Dr. I. P. S. Agrell and Else Welin-Berger), 705
Tumour-bearing Animals : Choline-Oxidase Activity of Host-Livers of (M. V. Narurkar, U. S. Kumta and M. B. Sahasrabudhe), 1128
Tumour-immune Spleens : Antitumour Effect of Culture Media from (E. Holečková and Dr. B. Sekla), 1298
Tumours (Mouse), in Pretreated Rats : Serological Changes Concomitant with the Growth of (M. Pikovski, C. Tal, M. Schlesinger and E. Margoliash), 185
Tungsten : Adsorption of Water on (R. J. Hill and P. W. M. Jacobs), 1117
Tuomikoski, R. : Systematics of Today (Über den heutigen Stand der Laubmoossystematik), 740
Tupari (Dr. Franz Caspar), translated by Eric Northcott, *review* by Dr. G. H. S. Bushnell, 1443
Tuppy, H. : Protein Structure and Biological Activity, 834
Turba, F. : Protein Structure and Biological Activity, 835
Turkevich, Prof. Anthony (Reed, Dr. George W., and) : Uranium, Helium and the Ages of Meteorites, 594
Turkey : Earthquakes in, 121
Turkey Poults : Lack of Growth-promoting Activity of Inactivated Penicillin with (J. R. Jowsey, F. D. Cook, H. I. MacGregor and R. M. Blakely), 923
Turnbull, A. S. : Appointed veterinary officer, Jamaica, 688
Turnbull, David (edited by Seitz, Frederick, and) : Solid State Physics, Vol. 1 and Vol. 3, *review* by Dr. R. O. Davies, 770
Turner, B. M. : Ionophoretic and Chromatographic Analysis of Single Dust Particles, 1472
Turner, Dr. D. T. : Block and Graft Copolymers, 536
Turner, H. S. : The Reactive Intermediates of Organic Chemistry, *review*, 1269
Turner, Sir James : The Role of Agriculture in British Economy (Presidential Address to Section M (Agriculture), of the British Association for the Advancement of Science), 486
Turrill, Dr. W. B. : Systematics of Today (Genetic Variation within Taxonomic Species), 741
Tustin, Prof. A. : The j Operator, *review*, 1263
Twentieth-Century Bestiary (A *Scientific American* Book), *review*, 1268
Twinn, D. C., and others : Methods of Studying the Microbiology of Soils (Fungal Infections of Free-living Nematodes can only be accurately estimated with Efficient Methods of Sampling Soil Nematodes), 592
Twinning and the Tabular Growth of Silver Bromide Crystals (Dr. R. W. Berriman and Dr. R. H. Herz), 293
Twins (Monozygotic) : Identical Nature of the Leucocyte Antigens detectable in, by means of Immune Iso-Leuco-agglutinins (J. Dausset and H. Brecy), 1430
Twiss, R. Q., and others : Correlation between Photons, in Coherent Beams of Light, detected by a Coincidence Counting Technique, 324
Two Inhibitory Fibres forming Synapses with a Single Nerve Cell in the Lobster (Dr. A. S. V. Burgen and Dr. S. W. Kuffler), 1490
Two—Wave-length Method : Photographic Densitometry with the (Dr. Mortimer L. Mendelsohn), 1408
Twomey, E. : Biology of the Salmon (The Age and Growth of Irish Salmon), 789
Type (A New), of Cardinostatic Agent (Prof. L. V. Heilbrunn, T. R. Tosteson, E. Davidson and W. L. Wilson), 924
Type (A New), of Nitrogen-fixing Bacterium (A. B. Roy and M. K. Mukherjee), 236
Type Culture Collections of Micro-organisms (International Association of Microbiological Societies funds for assisting the work of), 316
Type-Specific Polysaccharides containing Aldoheptose Sugars : *Pasteurella septica*—the Occurrence of (A. P. MacLennan and C. J. M. Rondle), 1045
Types of Evolutionary Process : The Three (Dr. Julian Huxley), 454
Tyrosinase : State of Copper in Polyphenoloxidase (Prof. Denis Kertész), 506
Tyrosine Hydroxyl Groups in Urea Solutions of Bovine Serum Albumin and Ovalbumin : Liberation of (A. N. Glazer, Dr. H. A. McKenzie and R. G. Wake), 1286
Tyrosine Peptides as Precursors of Melanin in Mammals (Dr. Kerry Yasunobu), 441

UBBELOHDE, Prof. A. R. : Hole and Claw Defects in Graphite, 380
Übermikroskopie : Tabellen der Elektronenphysik, Ionenphysik und (Baron Manfred von Ardenne), Band 1, Hauptgebiete ; Band 2, Hilfsgebiete, *review* by Dr. V. E. Cosslett, 1264
Uda, M. : The Abyssal Circulation of the Ocean, 734
Udenfriend, Sidney, and others : Biosynthesis of γ-Guanidinobutyric Acid from γ-Aminobutyric Acid and Arginine, 1125
Udintsev, G. B. (Sergeev, I. V., and) : A New Submarine Mountain in the Pacific Ocean, 530
Uhlenbroek, J. H., and others : New s-Triazine Herbicides, 147
Uldall, H. J. : Outline of Glossematics—a Study in the Methodology of the Humanities with special reference to Linguistics, Part 1, General Theory, *review* by P. T. Geach, 878
Ulotrichales : Chromosome Numbers in some Members of the (Y. S. R. K. Sarma), 46
Ultimate Upper Lethal Temperature and the Temperature-range for Good Health in the Roach (*Rutilus rutilus*) : Relation between the (Dr. A. W. Cocking), 661
Ultrasonic Extracts of *Pasteurella pestis* : Lethality for Guinea Pigs of—its Relationship to Death of Guinea Pigs from Plague (J. Keppie, H. Smith and E. C. Cocking), 1136
Ultrasonic Velocities in Rocks : A Simple Method of determining (K. Subbarao and Dr. B. Ramachandra Rao), 978
Ultrastructure of Erythrocytes in Severe Scurvy (Prof. Bruno Kisch and Gustav J. Martin), 812
Ultra-structure Research, Journal of, No. 1, 1452
Ultra-thin Serial Sectioning with Rocking Microtomes (Arwyn Charles), 1302
Ultra-Violet Absorption Spectra of L-Ascorbic Acid in Aqueous Solutions (Dr. J. S. Lawendel), 434
Ultra-violet Colour-translating Television Microscope (V. K. Zworykin, F. L. Hatke and C. Berkley), 71
Ultra-violet Irradiation of Dry Tobacco Mosaic Virus (Albert Siegel), 1430
Ultra-violet Light : Effect of, on Mouse Skin over a Wide Range of Intensities (Prof. S. Claesson, G. Wettermark and L. Juhlin), 992
Ultra-violet Light or Iodinated : Supercontraction of Wool irradiated with (A. R. Haly, M. Feughelman and June C. Griffith), 1064
Ultra-violet Radiation : Effect of, on the Respiration-Rates of Tobacco Leaves, and its Reversal by Visible Light (Dr. P. C. Owen), 610
Uncommon Weed Fungus of Mushroom Compost : *Heleococcum aurantiacum*, an (F. C. Wood), 283
Under-Developed Countries : Progress in, 447
Under-developed Territories : Education and the, 1099
Underhill, F. H. : Our Debt to the Future (Let us Look at our Human Resources), 260
Underwater Sounds heard from Sperm Whales (L. V. Worthington and William E. Schevill), 291
Underwater Swimming and Diving (British Association for the Advancement of Science, Section I (Physiology), Discussion on), 883
Unesco : Kalinga Prize for 1957 awarded to Earl Russell, 1454
  Report on Scientific and Technical Translating and other Aspects of the Language Problem, 1170
Unesco and its Programme XV : The International Geophysical Year—, *review* by G. A. Bull, 519
Unesco, and others : Symposium on the Physics of Elementary Particles, 412
Unexpected Effect in Sound Localization (D. H. Holding and J. P. Dennis), 1471
Unfertilized Eggs : Hermaphroditism and Self-Fertilization and the Monthly Extrusion of, in the Viviparous Fish *Lebistes reticulatus* (Dr. H. Spurway), 1248
Unified Theory of the Mechanism of Inhibition of Corrosion of Iron in Acid and Neutral Media based on the Electrocapillary Behaviour of Ions (C. P. De), 803
Unilever, Ltd. : Gift of £2,700 to the University College of North Staffordshire, for fellowships in the Department of Chemistry, 688
Union Observatory, Johannesburg : Retirement of Dr. W. H. van den Bos as Union Astronomer, 582
  Appointment of Dr. W. S. Finsen as Union Astronomer, 582
  Circular 116, Photographic Observations, 1392
Unisexual Flowers in the Ericales (E. J. Godley), 284
United Kingdom : Oil Consumption in the, 361

United Kingdom Atomic Energy Authority . Third Annual Report (1956-1957), 397
Appointment of Sir Leonard Owen as managing director of the Industrial Group, 529
Promotion of research workers, 639
Visits to the Dounreay establishment, 787
Atom, No. 7, 23, Bibliography on Atomic Energy, 837
Accident at Windscale (Prof. W. Murgatroyd), 1093
United Kingdom Atomic Energy Authority and the Norwegian Institute for Atomic Energy · Agreement for co-operation in connexion with the Norwegian Halden Reactor Project, 361
United Kingdom Contribution to the International Geophysical Year 1957-58 (Royal Society), *review* by G. A. Bull, 569
United Kingdom Petroleum Industry Statistics relating to Consumption and Refinery Production, 1955 and 1956 (Petroleum Information Bureau), 361
United Kingdom Scientific Mission in the British Commonwealth Scientific Office in Washington : Appointment of E. S. Hiscocks as director, 220
United Kingdom and other European Countries : University Interchange between the (1948-56), (British Council), 170
United Nations . Annual Report of the Technical Assistance Board for 1956, 895
Proceedings of the International Conference on the Peaceful Uses of Atomic Energy (Geneva, 1955), Vol 1, The World's Requirements for Energy ; Vol. 6, Geology or Uranium and Thorium, *review* by Dr. T. E. Allibone, 254 , Vol 7, Nuclear Chemistry and Effects of Irradiation , Vol. 11, Biological Effects of Radiation, *review* by Dr. T E. Allibone, 771
Forestry and the, 363
World Economic Survey, 1956, Supplement, Economic Developments in the Middle East (1955-56), 785
The Second Lesson—Seven Years at the (Bernard Moore), 933
United Nations (Food and Agriculture Organization) : Yearbook of Forest Products Statistics (1956), 72
Resignation of Dr. Ralph W Phillips as deputy director of the Agriculture Division, 122
Report of the First Meeting of the European Contact Group on the Uses of Isotopes and Radiation in Agricultural Research (Wageningen, 1956), 275
The Forest Work of the (Sir Beresford Pierce), 363
United Nations (World Health Organization) : Official Records No. 75, The Work of WHO 1956—Annual Report of the Director General to the World Health Assembly and to the United Nations, 320
Technical Report Series No. 118, Accidents in Childhood—Facts as a Basis for Prevention, 371
Technical Report Series No. 129, General Principles governing the Use of Food Additives, 1170
Chronicle, Vol. 11, No. 8, Report on the Effect of Radiation on Human Heredity, 1178
United States : Air and Water Pollution—the Position in Europe and in the (European Productivity Agency of the Organization for European Economic Co-operation, Project Nos. 136 and 145), *review* by Dr. A. Parker, 451
Fellowships for Study and Travel in the (Commonwealth Fund, New York), 585
The Geomagnetic Field in Upper Triassic Times in the (P. M. Du Bois, E Irving, N. D. Opdyke, Prof S. K. Runcorn and M. R Banks), 1186
United States Department of Agriculture : Appointment of Dr Ralph W. Phillips as director of the Division of International Organization Affairs in the Foreign Agricultural Service, 122
United States Geological Survey : Bulletin, No. 1028, Investigations of Alaskan Volcanoes, 19
Bulletin 1000-F, The Principles of Geochemical Prospecting (Dr. H. E. Hawkes), 1453
United States Government : Science and the, *review* by R. Brightman, 568
United States Institute of the Aeronautical Sciences (Royal Aeronautical Society and the) : Sixth Anglo-American Aeronautical Conference, 413
United States Junior Chamber of Commerce Award to be given to Dr S. Fred Singer, 836
United States National Academy of Sciences and the National Research Council · International Symposium on Military Psychology, 534
United States National Institute of Mental Health · Information Service on Psychopharmacology to be established by the Psychopharmacology Service Center, 735
United States National Research Council (United States National Academy of Sciences and the) International Symposium on Military Psychology, 534
United States National Science Foundation : Appointment of Dr. E. A. Eckhardt as assistant director, for the Division of Mathematical, Physical and Engineering Sciences, 169
Award of £10,000 to Aslib for research into the comparative efficiency of various indexing and literature search systems, 217
Availability of publications, 316
Fellowship Awards for 1958-59, 837
A Bibliography for the International Geophysical Year, *review* by G. A. Bull, 1155
Appointment of Dr B W. Adkinson as head of the Office of Scientific Information, 1237
United States National Science Foundation, and others . Third Biennial Carbon Conference, 571
Programme to improve the quality of Physics taught in American Schools and Colleges, 1452
United States National Science Foundation, and others (A Symposium sponsored by the) : Advances in Invertebrate Physiology (edited by Bradley T. Scheer), *review* by Prof. V B. Wigglesworth, 1309
United States Naval Observatory : Circulars 75 and 76 ; Measurements of Sunspots (Winifred Sawtell Cameron), 687
Circular 77, Solar Summary for 1956, 687
United States Office of Naval Research, and others : Third Biennial Carbon Conference, 571
United States Office of Naval Research, and others (sponsored by) : Transactions of the Symposium on Partial Differential Equations held at the University of California, 1955 (edited by N. Aronszajn, A. Douglis and C. B. Morrey, Jr.), *review* by Dr. L. S. Goddard, 58
United Steel Companies, Ltd. (Department of Operational Research and Cybernetics in Industry), in co-operation with the Sheffield College of Commerce and Technology : Lectures on Operational Research and Cybernetics in Industry, 72
Units : Atoms as (Prof. Casimir), 1178
Units of Biological Structure and Function . Enzymes— (edited by Oliver H. Gaebler), *review* by Prof D. D Woods, 1379
Units of Time and Length (Dr. L. Essen), 137
Units and Constants of Physics : Secular Changes of the (A. H Cook), 1194
Univalent Cobalt A New Compound of (Dr A A Vlček), 753
Universal and International Exhibition · Brussels (1958), 1322
Universe : The Dramatic (J. G Bennett), Vol. 1, The Foundations of Natural Philosophy, *review* by Dr. S. Raimes, 302
Universities : Report of an Inquiry into Applications for Admission to (R. K. Kelsall), (Committee of Vice-Chancellors and Principals of the Universities of the United Kingdom), 299
Universities of the British Commonwealth, Association of · Yearbook of the Universities of the Commonwealth, 1957, *review*, 774
Universities of the Commonwealth Yearbook of the, 1957 (Association of Universities of the British Commonwealth), *review*, 774
Universities of the United Kingdom (Committee of Vice-Chancellors and Principals of the) : Report of an Inquiry into Applications for Admission to Universities (R K. Kelsall), 299
Universities (British) : Scientific Research in (1956-57), 1323
Universities and University Colleges in receipt of Treasury Grant, Academic Year 1955-1956 · Returns from (University Grants Committee), 539
Universities Federation for Animal Welfare · Summer School for undergraduates of all faculties, 172
University of Aberdeen Statistics in the, 1031
University of Adelaide : Appointment of Dr. R. F. Whelan to the chair of human physiology and pharmacology, 685
University of Bergen—New Laboratory Buildings of the Biological Station (Prof. Hans Brattstrom), 1159
University of Birmingham Appointment of Dr H. E. Daniels to the chair of statistics, 119
Appointment of Dr. W I Stephen as lecturer in chemistry, 122
Appointment of Dr. J. Wilcock as lecturer in industrial metallurgy, 122
Appointment of W. B Powell as staff fellow in the Department of Physics, 122
Appointment of Dr. P. C Harris as lecturer in medicine, 122
Appointment of Dr. K. Brown-Grant as lecturer in physiology, 122
Title of reader in organic chemistry conferred on Dr. J. C Tatlow, 122
Symposium on Chemical Engineering Education, 125
Appointment of Dr S. R M Ellis to the second chair in the Chemical Engineering Department, 465
Appointment of L Castillejo as lecturer in mathematical physics, 738
Appointment of Dr. G. C. Brock as lecturer in civil engineering, 738
Appointment of Dr. R J Allwood as temporary lecturer in civil engineering, 738
Appointment of G. V. Jeffreys and Dr D. R. Oliver as lecturers in chemical engineering, 738
Appointment of R. W. Snell as lecturer in petroleum production engineering, 738
Appointment of P. D. Allen as lecturer in mechanical engineering, 738
Appointment of Dr. B. Shaw as lecturer in medical biochemistry and pharmacology, 738
Appointment of Dr. A P. Batson, N E Booth and Dr. J. D Hobson as Imperial Chemical Industries Research Fellows, 738
Josiah Mason Lectures (Prof I Schapera), *review* by Dr. A L. Epstein, 1442
University of Birmingham (Department of Industrial Metallurgy) · Joining of Metals Conference on the Wetting and Spreading of Liquid Metals on Solid Metal Surfaces, 72, 1156
University of Bristol : Retirement of Prof. W. W. Jervis from the chair of geography, 216
Appointment of Prof R F. E. W. Peel to the chair of geography, 216
Retirement of Prof T. Wallace as director of the Long Ashton Research Station and professor of horticultural chemistry, 267
Course of lectures on Observations of Dislocations in Metals and Inorganic Crystals, 467
Appointment of Dr. H. G H. Kearns as director of the Long Ashton Research Station and to a professorship in the University, 585, 685
Appointment of Dr D. W Barritt as lecturer in medicine, 1171
Appointment of I. W. Cameron as lecturer in dental surgery (prosthetics), 1171
Appointment of Dr. L C. Frost as lecturer in genetics in the Department of Botany, 1171
Appointment of N. St G. Hyslop as lecturer in clinical veterinary pathology, 1171
Appointment of Dr. P. M. Llewellyn as lecturer in physics, 1171
Appointment of Barbara M. Q. Weaver as lecturer in veterinary surgery, 1171
Grants from the Department of Scientific and Industrial Research to the Department of Physics of £4,000 for experimental research in nuclear physics and cosmic radiation, £3,600 for experimental research into flights with free balloons of long duration at 100,000 ft., and £3,100 for work on measurement in relativistic quantum theory, 1171
Grants from the National Coal Board to the Department of Physical and Inorganic Chemistry of £1,000 and £750 for the study of the reactivity of carbon surfaces with oxygen and a study of the structure of active carbons, 1171
Bequest from the late Miss Nebendahl of £1,000 to the University's Cancer Research Fund, 1171
Grants from the Department of Scientific and Industrial Research to the Department of Organic Chemistry of £866 for research on chlorogenic acid and closely related compounds, and £600 for continuation of research on cell-wall carbohydrates of plums, 1171
Bequest from Mrs A M. Fertel of more than £5,000 to found one or more studentships for the furtherance of experimental research in physics, preferably in nuclear physics, 1171
Annual Report for 1956 of the Agricultural and Horticultural Research Station, Long Ashton, 1400
University of Buenos Aires, and others : Symposium on the Physics of Elementary Particles, 412

- University of Buffalo, and others : Third Biennial Carbon Conference, 571
- University of Calcutta : Hundred Years of the—a History of the University issued in Commemoration of the Centenary Celebrations, *review* by Dr Robert Aitken, 1152
- University of California, and others (sponsored by) : Transactions of the Symposium on Partial Differential Equations held at the University of California, 1955 (edited by N. Aronszajn, A. Douglis and C. B. Morrey, Jr), *review* by Dr. L S. Goddard, 58
- University of Cambridge Report of the General Board of the Faculties on a University Course in Arts and Science, 173
  - Appointment of Prof J S. Mitchell as regius professor of physics, 582
  - Offer of Entrance Exhibitions by Trinity College, 1239
- University of Cambridge (School of Agriculture) Agricultural Research and Teaching at Cambridge, Vol 1, 227
- University of Cambridge (Department of Physics), and the British Scientific Instrument Research Association : Meeting on the Vacuum Deposition of Metals, 124
- University of Chicago . Awards for Study in Statistics, 688
- University of Coimbra Grant of £2,500 from the Calouste Gulbenkian Foundation, Lisbon, to the Institute of Archaeology, for archaeological research in Iraq, 1027
- University of Dublin Retirement of Prof. John Purser from the chair of civil engineering in Trinity College, 464
  - Appointment of Dr W. Wright to the chair of civil engineering in Trinity College, 464
- University of Durham Retirement of Prof H C. Pawson from the chair of agriculture in King's College, Newcastle-upon-Tyne, 1391
  - Election of Prof H. C Pawson as professor emeritus, 1391
  - Appointment of Prof T. W. Walker to the chair of agriculture in King's College, Newcastle-upon-Tyne, 1392
- University of Edinburgh Appointment of Prof R. Cruickshank as professor of bacteriology, 363
- University of Exeter . Appointment of D. R Barber as superintendent of the Norman Lockyer Observatory, 738
  - Appointment of A. Stuart to the newly created chair of geology, 1239
  - Appointment of Dr. K E. Grew as reader in physics, 1239
  - Appointment of G. A. Duller as assistant lecturer in mathematics, 1239
  - Appointment of Dr. H P. Mulholland as senior lecturer in mathematics, 1239
  - Appointment of D J. Stone as lecturer in mathematical statistics, 1239
  - Appointment of Dr. R J Williams as lecturer in physical chemistry, 1239
- University of Glasgow · Appointment of Prof. R A Raphael to the regius chair of chemistry, 1025
  - Appointment of Dr D. C. Gilles as director of the Electronic Computer Laboratory, 1172
  - Appointment of Dr R Hodges and Dr. A. I. Scott as lecturers in chemistry, 1172
  - Appointment of Dr D H Watson to an Imperial Chemical Industries Fellowship in chemistry, 1172
  - Grant of up to £50,000 from the Wellcome Trustees, for the building of a Small Animals Experimental Research Unit at the Veterinary Hospital, Garscube, 1172
- University of Illinois *Illinois Journal of Mathematics*, Part 1, 70
- University of Kansas and others (sponsored by) Transactions of the Symposium on Partial Differential Equations held at the University of California, 1955 (edited by N Aronszajn, A Douglis and C B. Morrey, Jr), *review* by Dr. L S. Goddard, 58
- University of Khartoum . Appointment of Dr. J. B. Lynch to the chair of pathology, 585
  - Appointment of Donald Portway to the chair of mechanical engineering, 585
- University of La Plata, and others · Symposium on the Physics of Elementary Particles, 412
- University of Lisbon : Grant of £22,500 from the Calouste Gulbenkian Foundation, Lisbon, to the Faculty of Medicine, to install, equip and maintain a laboratory of electron microscopy in the Institute of Histology and Embryology, and £18,500 to the Laboratory of Physiological Chemistry, for essential materials and research, 1027
- University of Liverpool (Extra-Mural Department) · Residential Course on Tensors in Electrical Engineering, 369
- University of London Appointment of Dr. F D Richardson to the chair of extraction metallurgy at the Imperial College of Science and Technology, 18
  - Appointment of Prof H. Ford to the University chair of applied mechanics at the Imperial College of Science and Technology, 21
  - Appointment of Prof D Williams to the University chair of mining geology at the Imperial College of Science and Technology, 21
  - Appointment of Prof W D Wright to the University chair of technical optics at the Imperial College of Science and Technology, 21
  - Course in Photoelasticity to be held in the Department of Civil and Municipal Engineering, University College, 21
  - Appointment of Dr. H C. K Henderson to the University readership in geography at Birkbeck College, 122
  - Title of reader in physics in the University (at the Imperial College of Science and Technology) conferred on W. R S. Garton, 122
  - Title of professor emeritus in the University conferred on Prof. C W Dannatt, 220
  - Title of professor emeritus in the University conferred on Prof J B. S. Haldane, 220, 1172
  - Title of professor emeritus in the University conferred on Prof B. J. Lloyd-Evans, 220
  - Title of professor emeritus in the University conferred on Prof. W. H Pearsall, 220
  - Title of professor emeritus in the University conferred on Prof. William Wardlaw, 220
  - Appointment of Dr. Douglas McKie to the University chair of the history and philosophy of science at University College, 220, 267
  - Appointment of Dr. M. Freedman to the University readership in anthropology at the London School of Economics and Political Science, 220
  - Appointment of S. J Gould to the University readership in social institutions at the London School of Economics and Political Science, 220
  - Appointment of Dr. P. L. le Roux to the University readership in medical parasitology at the London School of Hygiene and Tropical Medicine, 220
  - Appointment of Dr. J F. Sutcliffe to the University readership in botany at King's College, 220
  - Appointment of Dr S D. Elek to the chair of bacteriology at St. George's Hospital Medical School, 316, 1172
  - Appointment of Dr F R Johnson to the readership in anatomy at the London Hospital Medical College, 316
  - Appointment of Dr. P H. Spencer-Silver to the readership in anatomy at Middlesex Hospital Medical School, 316
  - Title of reader in pharmacology in the University (at Charing Cross Hospital Medical School) conferred on Dr. J B. E. Baker, 316
  - Title of reader in sociology in the University (at the London School of Economics and Political Science) conferred on E A. Gellner, 316
  - Title of reader in anatomy in the University (at Charing Cross Hospital Medical School) conferred on Dr. T. W. Glenister, 316
  - Title of reader in chemistry in the University (at Bedford College) conferred on Miss D. M Hall, 316
  - Symposium at Queen Mary College on Solvent Effects and Reaction Mechanism, 534
  - Seminar at University College on Block and Graft Copolymers, 535
  - Grant of 121,000 dollars from the Rockefeller Foundation, New York, to King's College, for biophysics research, 891
  - Expansion of the Imperial College of Science and Technology, 891
  - Exhibition of New University Architecture, 891
  - Appointment of Dr P. T. Matthews to the University readership in applied mathematics at the Imperial College of Science and Technology, 893
  - Evening Reception and Reunion at University College, 1394
- University of Madras Centenary number of the *Journal*, 686
- University of Manchester Appointment of Prof G J. Kynch to the chair of mathematics in the Faculty of Technology, 69
  - Appointment of Prof W. E. Morton as vice-principal and Arkwright professor of textiles in the Manchester College of Science and Technology, 169
  - Appointment of J J Vincent to the chair of textile technology in the Manchester College of Science and Technology, 169
  - Appointment of Dr R. N Haszeldine to the chair of chemistry in the Faculty of Technology, 360
  - Retirement of R U Sayce from the keepership of the Manchester Museum, 411
  - Appointment of Dr D E. Owen as keeper of the Manchester Museum, 411
  - Exhibition of Laboratory Apparatus and Techniques at the Manchester College of Science and Technology, 1239
  - Company Executive Development Scheme, a Survey of North-West England (British Institute of Management and the Manchester College of Science and Technology), 153
  - Retirement of Ernest Ashby as chief steward and technician in the Laboratory of Cryptogamic Botany, 1026
- University of Nottingham : International Conference on High Polymers, 467
- University of Oregon, and others (A Symposium sponsored by the) : Recent Advances in Invertebrate Physiology (edited by Bradley T. Scheer), *review* by Prof. V. B. Wigglesworth, 1309
- University of Oxford : Appointment of Dr D. H. Wilkinson as professor of nuclear physics at the Clarendon Laboratory, 464
  - Gift of £65,000 from Isaac Wolfson, to establish a professorship in metallurgy, 1319
  - Appointment of Dr. W. Hume-Rothery as the first Isaac Wolfson professor of metallurgy, 1321
- University of Reading (Sir John Wolfenden), 13
  - Activities in the Museum of Rural Life during 1956, 18
  - A History of Whiteknights (Dr Ernest Smith), 18
  - Report for 1956 of the National Institute for Research in Dairying, 965
- University of Sheffield Appointment of G. R. Hervey as lecturer in physiology, 21
  - Appointment of Dr. B B Argent as lecturer in metallurgy, 21
  - Appointment of D Parsons as assistant lecturer in physics, 21
  - Appointment of B Truelove as junior research fellow in botany, 21
  - Appointment of D Bryce as junior research fellow in zoology, 21
  - Offer by Edgar Allen and Co , Ltd., to establish a postgraduate scholarship for study or research, to be known as the Charles Kingston Everitt Memorial Scholarship, 21
  - Offer by John Thompson, Ltd , of Wolverhampton, to establish a research scholarship in the Department of Mechanical Engineering, to be known as the John Thomson Research Scholarship in Mechanical Engineering, 21
  - Donation of £4,000 from Metropolitan-Vickers Electrical Co., Ltd , to provide equipment for the Department of Mechanical Engineering, 21
  - Gift of £25,000 by Imperial Chemical Industries, Ltd., towards the cost of building extensions to the Departments of Chemistry and of Fuel Technology and Chemical Engineering, 122
  - Electrical Engineering at the—New Laboratories, 414
  - Appointment of P H. Blundell as director of the Electronic Computation Laboratory, 893
  - Appointment of Dr. B Stevens as lecturer in physical chemistry, 893
  - Appointment of M. S. Clements as lecturer in civil engineering, 893
  - Appointment of Dr. Russell Brown as lecturer in electrical engineering, 893
  - Appointment of C. J. Edmonds to the Boots Research Fellowship for work in the Department of Pharmacology and Therapeutics, 893
  - Appointment of D. J Williams to the C H. Desch Research Fellowship in metallurgy, 893
  - Appointment of P L. Chambers to the John Stokes Research Fellowship to be held in the Department of Physiology, 893
- University of Upsala : Symposium on Systematics of Today, 739
- University of Utrecht : Appointment of Dr. Frans Verdoorn as director of the Biohistorical Institute, 1169
- University of Western Australia : Conference on Spectroscopy, *erratum*, 122
- University of Wisconsin, and others : Symposium on Latency and Masking in Viral and Rickettsial Infections, 788
- University Apartheid in South Africa (International Committee on Science and Freedom in co-operation with the Association of University Teachers Meeting on), 686, 1163

University Architecture Exhibitions Committee and the Arts Council of Great Britain : Exhibition at the University of London of New University Architecture, 891
University Architecture (New) : Exhibition of, at the University of London (University Architecture Exhibitions Committee and the Arts Council of Great Britain), 891
University College, Cork : Mathematical Colloquium at, 363
University College, London : Course in Photoelasticity to be held in the Department of Civil and Municipal Engineering, 21
  Appointment of Dr. Douglas McKie to the University of London chair of the history and philosophy of science, 220, 267
  Seminar on Block and Graft Copolymers, 535
  Evening Reception and Reunion, 1394
University College of North Staffordshire : Appointment of Dr. D. J. Bartholomew as lecturer in social statistics, 688
  Appointment of Dr. E. Corinaldesi as lecturer in mathematics, 688
  Elevation of the Polymer Corporation Research Studentship to a post-doctoral Research Fellowship, 688
  Appointment of P. P. Rutherford as Polymer Corporation Research Fellow, 688
  Gift of £3,000 from the National Coal Board, for research in the stratigraphy of the North Staffordshire coalfield, 688 ; appointment of Dr. J. B. Haynes to work on this project, 688
  Gift of £2,700 from Unilever, Ltd., for fellowships in the Department of Chemistry, 688
University College of North Wales : Appointment of Dr. R. C. Evans as principal, 529
University College of Rhodesia and Nyasaland : Installation of the Queen Mother as President (Prof. F. G. Young), 409
University College of the West Indies (Medical Research Council Tropical Metabolism Research Unit) : Dried Lanterns from Fireflies (*Photinus pallens*), 1454
University Colleges in receipt of Treasury Grant, Academic Year 1955-1956 : Returns from Universities and (University Grants Committee), 539
University Course in Arts and Science (Report of the General Board of the Faculties of the University of Cambridge), 173
University Education : Corporate Life in, 1005
University Entrants : Selection of, 299
University Grants Committee : Returns from Universities and University Colleges in receipt of Treasury Grant, Academic Year 1955-1956, 539
  Report of the Sub-Committee on Halls of Residence, 1005
University Institute of Agronomy, Louvain : Symposium on Methods of Studying the Microbiology of Soils, 591
University Interchange between the United Kingdom and other European Countries, 1948-56 (British Council), 170
University Teachers, Association of (International Committee on Science and Freedom, in co-operation with the) : Meeting in London in support of the South African Universities against *apartheid*, 686, 1163
University Training in Industry : Significance of, 871
University Women, British Federation of : Report on Opportunities for Girls and Women in Science and Technology, 127
Unknown (A Hitherto) Blood Clotting Defect in Haemophilia and Christmas Disease (Dr. F. Nour-Eldin and Dr. John F. Wilkinson), 990
Unloading Effects in Copper Single Crystals (Dr. M. J. Makin), 1476
Unpolarized Positive Muons : Longitudinal Polarization of the Positrons from the Decay of (G. Culligan, S. G. F. Frank, J. R. Holt, J. C. Kluyver and T. Massam), 751
Unsaturated Hydrocarbon Gases : Electric Strength of (Dr. A. E. D. Heylen), 703
Unsuspected Factor which Influences Consumption of Alcohol by Rats (R. J. G. Gillespie and Prof. C. C. Lucas), 1292
Unwin, R. S., and Gadsden, Dr. M. : Determination of Auroral Height by Radar, 1469
Upper Lethal Temperature and the Temperature-range for Good Health in the Roach (*Rutilus rutilus*) : Relation between the Ultimate (Dr. A. W. Cocking), 661
Upper Triassic Times in the United States : The Geomagnetic Field in (P. M. Du Bois, E. Irving, N. D. Opdyke, Prof. S. K. Runcorn and M. R. Banks), 1186
Uppingham School : New Laboratories at, 1244
Uptake of Benzpyrene by a Chromosomal Phospholipid (Dr. J. Chayen, L. F. La Cour and P. B. Gahan), 652
Uptake of Salt by Plant Cells : An Effect of *p*H on the (R. G. Hurd and Dr. J. F. Sutcliffe), 233
Uptake of Vitamin B_{12} by the Intact Rat : Effect of Analogues on the (Dr. A. L. Latner and Dr. Laureen Raine), 1197
Uptake (Salt), in Plants : Radiosensitivity of (D. A. Barber, Dr. G. J. Neary and Dr. R. Scott Russell), 556
Uracils : Reaction of Bromine with (Dr. Shih Yi Wang), 91
Uranediol : Isolation of, from the Urine of Pregnant Mares (W. L. Glen, R. Barber and G. A. Grant), 288
Uranium, Helium and the Ages of Meteorites (Dr. George W. Reed and Prof. Anthony Turkevich), 594
Uranium and Thorium : Geology of (Proceedings of the International Conference on the Peaceful Uses of Atomic Energy, Geneva, 1955, Vol. 6), *review* by Dr. T. E. Allibone, 254
Urbański, Prof. T., and others : Fungistatic Activity of some Hydroxamic Acids, 1204
Ure, G. R., and others : The Arachin Molecule, 971
Urea Solutions of Bovine Serum Albumin and Ovalbumin : Liberation of Tyrosine Hydroxyl Groups in (A. N. Glazer, Dr. H. A. McKenzie and R. G. Wake), 1286
Urey, Prof. H. C. : Planetary Atmospheres and Convection in Rotating Fluids (The Escape of Planetary Atmospheres), 1458
Urinary Œstrogen Excretion by the Bull (Welert Velle), 856
Urine of Pregnant Mares : Isolation of Uranediol from the (W. L. Glen, R. Barber and G. A. Grant), 288
Urian, R. R. (Logie, Dr. H. F., and) : A Surface Electroluminescence Effect in Diamonds, 1254
d-Urobilin : Structure of (Prof. C. H. Gray and Dr. D. C. Nicholson), 336
Urwin, Dr. J. R. : High Polymer, Colloid and Surface Chemistry (New Methods for preparing Block Co-Polymer), 960
Urwin, Dr. J. R. (Robertson, Dr. W. G. P., and) : High Polymer, Colloid and Surface Chemistry, 959
Use of Chelating Agents : Removal of Internally Deposited Radiocerium by the (Dr. A. Catsch and Du Khuong Lê), 609
Use of Coal : Science in the (Institute of Fuel Conference on), 531, 893
Use of Food Additives : General Principles governing the (World Health Organization Technical Report Series No. 129), 1170
Use of Goose Cells in Haemagglutination Tests with Arthropod-borne Viruses (Dr. J. S. Porterfield), 1201
Use of a Histochemical Technique to demonstrate the Cutaneous Penetration of Adrenalin and Nor-Adrenalin (Dr. G. H. Bourne), 1488
Use of Insecticides for the Control of Virus Diseases (Association of Applied Biologists Symposium on), 1454
Use of Isotopes in Agriculture (Dr. E. C. Humphries), 275
Use of Logarithms to the Base 2 in Recording Serological Reactions (John W. Vennes, Russell E. MacDonald and Philipp Gerhardt), 1363
Use of Natural Resources : Search for and, 735
Use of 'Nobecutane' in attaching Skin Electrodes (Flight-Lieut. M. Kennedy Browne), 192
Use of Pilocarpine in Pancreatic Research (Dr. Winfield S. Morgan), 987
Use of Statistics in Personnel Management (Institute of Personnel Management and the National Institute of Industrial Psychology Course in), 220
Use of the Term 'Young's Equation' for Contact Angles (Prof. N. K. Adam), 809
Use of Wooden Boxes for Breeding Mice (Joyce L. Bloom, Dr. W. Lane-Petter and G. Porter), 251
Use (Commercial), of Atomic Energy : Progress in the, 1096
Useful Fungi, *review* by R. Chamberlain, 936
Uses of Isotopes and Radiation in Agricultural Research (Report of the First Meeting of the European Contact Group, Wageningen, 1956), (Food and Agriculture Organization of the United Nations), 275
U.S.S.R. : Hydro-electric Power in the (Dr. A. H. M. Arnold), 177
  Low-Temperature Physics in the (Dr. K. Mendelssohn), 460, *erratum*, 893
Uterine Anaphylaxis in Guinea Pigs sensitized with Homologous Testis or Sperm : *In vitro* Demonstration of (Dr. Seymour Katsh), 1047
Utilization of 4-Amino 5-Imidazole Carboxamide in Plant Tissues (Prof. K. V. Giri and P. R. Krishnaswamy), 1427
Utilization of Carbohydrate Metabolites by Rumen Micro-organisms (the late Dr. A. John G. Barnett and M. G. C. M. Dow), 548
Utilization of Light : Perception and, *review* by Dr. Robert Hill, 108
Utilization (Methionine Biosynthesis and), in *Pseudomonas tabaci* and *Ps. angulata* (Prof. E. D. Garber and Susan G. Shaeffer), 1282
Utne, Finn, and others : Effect of Relative Humidity on Rat Breeding and Ringtail, 290

VACANCIES and other Point Defects in Metals and Alloys (Metals Physics Committee of the Institute of Metals Symposium on), 893
Vacuolated Neurones in the Medulla of Sheep affected with Scrapie : Significance of (I. Zlotnik), 393
Vacuum Deposition of Metals (Department of Physics of the University of Cambridge and the British Scientific Instrument Research Association Meeting on), 124
Vacuum Deposition Plant : X-Ray Radiation Hazard using (L. Holland), 89
Vade-Mecum : The Electron Physicist's, *review* by Dr. V. E. Cosslett, 1264
Vainu Bappu, Dr. M. K., and Sinvhal, Dr. S. D. : Polarization of Comet Arend-Roland, 1410
Valency and Molecular Structure (E. Cartmell and Dr. G. W. A. Fowles), *review* by Prof. J. R. Partington, 109
Valentine, Dr. R. C., and Hopper, Dr. P. K. : Polyhedral Shape of Adenovirus Particles as shown by Electron Microscopy, 928
Values : Science and, *review* by Prof. J. D. Bernal, 104
Values (Human) : Modern Science and (Prof. Everett W. Hall), *review* by Prof. J. D. Bernal, 104
Valves : Thermionic (T. E. Goldup), 784
Vámos, R. : Chemical Examination of the Water of Flooded Rice Fields, 1484
van Bekkum, D. W., and others : Surviving Rat Skin Grafts in Mice, 238
van Duin, H. : Chromatography by Liquid-Liquid Partition and Liquid-Liquid Interface Adsorption, 1473
van Esch, G. J., and others : Influence of Hexanitrodiphenylamine on the Incidence of Neoplasms in the Mammary Tissue of Rats, 509
van Genderen, H., and others : Influence of Hexanitrodiphenylamine on the Incidence of Neoplasms in the Mammary Tissue of Rats, 509
van Krevelen, D. W., and others : At the Second International Conference on Coal Science (Production from Cellulose of an Oil resembling Perhydrophenanthrene in Analysis and Infra-red Absorption), 418 ; (Properties, or the Thermal Decomposition Products, of Maceral Concentrates), 418 ; (Dilatation of various blends of Coals and Coke on Heating), 419
Van Loon, Edward J., and others : Enhancement of Vitamin B_{12} Absorption by Substances other than Intrinsic Factor, 1401
Van Scott, Dr. E. : Biology of Hair Growth (Structure of the Hair and the Hair Follicle), 592 ; (Method of Using Hair Roots as a Tool for checking the Effects of Ionizing Radiations on the Body), 594
van Steenis, C. G. G. J. : Systematics of Today (Specific Delimitation, with special reference to Tropical Plants), 740
van Weel, Dr. A. : Awarded the Louis Sterling Premium of the British Institution of Radio Engineers, 529
Van den Akker, Dr. J. A. : Fundamental Aspects of Fibres and their Treatment for Papermaking (Process of Beating—Energy Considerations), 1177
van den Bos, Dr. W. H. : Retirement as Union Astronomer at the Union Observatory, Johannesburg, 582 ; work of, 582
  The Orbit of Kui 33, 1393
  The Orbit of φ 47, 1393
  The Orbit of β 430 = ψ Sgr., 1393
  Micrometer Measures of Double Stars, 1393
van den Brenk, H. A. S. : Radiation Lethality and Local Tissue Damage in Histamine-depleted Rats, 1467
Van den Ende, Prof. Marinus : *Obituary* by Sir Henry Dale, 168
van der Helm, H. J., and others : Amino-Acid Composition of Adult and Foetal Myoglobin of the Cow, 239
  Myoglobins from Sheep Homozygous for Different Haemoglobin Types, 240
  Evidence of a Second Foetal Haemoglobin in the Newborn Goat, 758
Vanadium : Colorimetric Determination of (H. Compaan), 980

Vanadium—Hydrogen Peroxide System : Complexity of the (Dr. G. Kakabadse and H. J. Wilson), 861
Vanasse, G. A. Interference Spectroscopy, 956
VanDemark, N. L. (Salisbury, Prof. G. W., and) : Carbon Dioxide as a Reversible Inhibitor of Spermatozoan Metabolism, 989
Vanderhaeghe, F., and others : Relation between Ribonuclease Activity and Ribonucleic Acid Content, 1048
Vapour (Dissociated Peroxide) : Nature of the Product condensed at Low Temperatures from (R. L. Allen and Dr. F. S. Stone), 752
Vapour Detectors for Gas Chromatography (Gas Chromatography Discussion Group of the Institute of Petroleum Symposium on), 22
Vapours : A Significant Error in the Determination at Low Pressures of the Virial Coefficients of (Prof. R. Whytlaw-Gray and Dr. G. A. Bottomley), 1252
Vardheim, S. V., and others : Characterization of 2-Amino-2-Deoxy-D-Altrose, 247
Variability in Retention of Marine Phytoplankton by Membrane Filters (Dr. Reuben Lasker and Robert W. Holmes), 1295
Variable Star 12 Lacertae . Combined Light and Velocity Measurements of the (A. Brami, G. Bakos, P. Broglia, B. Cester, J. F. Heard, M. Hack, M. Huruhata, C. de Jager, J. Kubikovski, J. J. Kumsishvili, R. Lynds, N. L. Magalashvili, S. V. Nekrasova, G. J. Odgers, J. J. Ruiz, J. Sahade, H. J. Smith, M. J. Smyth, N. Thomas and M. Walker), 1112
Variable Stars in the Magellanic Clouds (M. W. Feast), 229
Variation of Elastic Constants of Hardened 1 per cent Carbon Steels on Tempering (A. F. C. Brown, A. G. Cole and M. F. Markham), 1254
Variation of the Horizontal Force near the Magnetic Equator (Prof. N. S. Alexander and C. A. Onwumechilli), 191
Variation in the Number of Buttercup Petals (E. A. Potter), 179
Variation in the Time of Release of the Ovarian Development Hormone in *Aedes aegypti* (Dr. J. D. Gillett), 656
Variation (Annual), of Sporadic Meteors : Theory of the (Tadayoshi Murakami), 1239
Variation (Diurnal) : Travelling Disturbances in the Ionosphere—Changes in (Dr. G. H. Munro), 1252
Variation (Diurnal), in the Occurrence of 'Dawn Chorus' (Joseph H. Pope), 433
Variations in Human Serum β-Globulins (Dr. O. Smithies), 1482
Varley, Dr. J. H. O. : Promoted to Senior Principal Scientific Officer by the United Kingdom Atomic Energy Authority, 639 ; work of, 639
Varner, J. E., and others : Respiratory Metabolism of Aerated Potato Disks, 1142
Varney, R. : Ionization Phenomena in Gases (Ionization of Gases by Positive-Ion Impact), 791
Varves (Carboniferous Glacial), of Australia : Directions of Magnetization in the (E. Irving), 280
Vasculum and the Microtome (Prof. D. A. Webb), 487
Vector Analysis (Prof. Louis Brand), *review* by Dr. A. W. Gillies, 824
Vegetable Quality : Second International Colloquium on, 174
Vegetable Research Station, National Formation of the National Vegetable Research Station Association, 530
Vegetables : Evaporation from Grass and (N. E. Rider), 20
Vegetative Hyphae of Higher Fungi (Hymenomycetes) : Mitosis in (Prof. S. R. Bose), 45
Vees, A. : Recent Advances in Gelatin and Glue Research, 691
Velle, Weiert : Urinary Œstrogen Excretion by the Bull, 856
Velocities (Ultrasonic), in Rocks : A Simple Method of determining (K. Subbarao and Dr. B. Ramachandra Rao), 978
Velocity of Compressional Waves for a Stratigraphic Profile of Chalk at Flamborough, Yorkshire (A. S. Laughton and A. H. Stride), 977
Velocity of the Seismic Waves *Lg* and *Rg* across Australia (B. A. Bolt), 495
Velocity Measurements : Combined Light and, of the Variable Star 12 Lacertae (A. Abrami, G. Bakos, P. Broglia, B. Cester, J. F. Heard, M. Hack, M. Huruhata, C. de Jager, J. Kubikovski, J. J. Kumsishvili, R. Lynds, N. L. Magalashvili, S. V. Nekrasova, G. J. Odgers, J. J. Ruiz, J. Sahade, H. J. Smith, M. J. Smyth, N. Thomas and M. Walker), 1112
Venables, D. G., and others : Specific DDT-Resistance in Houseflies, 1132
Venables, Dr. P. F. R. : Chemical Engineering Education (Methods of Training), 126
  Supply of Scientists and Technologists for Industry, 305
Vennes, John W., and others : Use of Logarithms to the Base 2 in Recording Serological Reactions, 1363
Venom of the Tiger Snake (*Notechis scutatus*) : Additional Purine Compounds in the (Hazel M. Doery), 799
Venom (Rattle-snake) : Phosphodiesterase from (Prof. M. Laskowski, Gloria Hagerty and Ulla-Riitta Laurila), 1181 ; (Dr. Hans G. Boman), 1182
Ventilation of Museums : Heating and (Dr. A. E. A. Werner), 1324
Ventricle (Right-) Pressures and Heart-Rate in Diving Birds (Einar Eliassen), 512
Ventzel, V. A. (Brandt, N. B., and) : Low-Temperature Physics (Influence of Pressure on the de Haas—van Alphen Effect), 461
Verdcourt, B. Possible Occurrence of Strains in Species of Schistosomes, 865
Verdoorn, Dr. Frans : Appointed director of the Biohistorical Institute of the University of Utrecht, 1169 ; work of, 1169
Vering, F. : Biological Rhythms (Implications for Bioassay of Daily Fluctuations), 1101
Verkin, B. I., and others : Low-Temperature Physics (Influence of Pressure on the de Haas—van Alphen Effect), 461
Verma, S. C. (Mehra, P. N., and) : Cytology of Indian Species of *Onychium*, 715
Vernal Sloughing of Sludge Deposits in a Sewage Effluent Channel (R. W. Edwards), 100
Vernalization of Green Plants of a Winter Wheat (Dr. M. B. Gott), 714
Verney, Prof. E. B. (Jewell, P. A., and) : An Experimental Attempt to Determine the Site of the Neurohypophysial Osmoreceptors in the Dog, 129
Vernon, Dr. W. H. J. : The Conservation and Corrosion of Metals, 687
Verona, Prof. O. (Simonart, Prof. Paul, and) Methods of Studying the Microbiology of Soils (Methods of Sampling Soil Fungi), 592
Vertebrate Nerve (Clamped) : Membrane Currents in (José del Castillo, J. Y. Lettvin, W. S. McCulloch and W. Pitts), 1290
Vertebrates and Invertebrates : Chemical Transmission of Nerve Impulses in (Dr. Catherine O. Hebb), 627
Verticillium Wilt of Hops at Wye College : Progressive, 786
Very Young : Nutrition of the (Scottish Group of the Nutrition Society Symposium on), 413, 949
Vesicular-Arbuscular Mycorrhizas in Apple Seedlings (Dr. Lilian E. Hawker and Angela M. Ham), 998
Veterinary Association, British : Annual Congress, 316
Veterinary Research, Department of (Federation of Nigeria) : Appointment of T. M. Denoon as temporary livestock superintendent, 1098
Viability of *Aerobacter aerogenes* : Relationship between the Concentration of Anionic Surface-active Agents and the Electrophoretic Mobility and (Dr. D. E. E. Loveday and Dr. A. M. James), 1121
Viaud, G., et autres . l'Instinct dans le Comportement des Animaux et de l'Homme, *review* by Dr. P. T. Haskell, 518
Vibrationally Excited Oxygen Molecules : Production of, in the Flash Photolysis of Ozone (W. D. McGrath and Prof. R. G. W. Norrish), 1272
Vibrations (Molecular), and Standard Deviation of Interatomic Distances in Benzene (Prof. O. Bastiansen and S. J. Cyvin), 980
Vibrio cholerae : Lysis of, by Thymol (Dr. K. Bhaskaran), 43
Vickers, Prof. J. M. F. : Ranque Vortex-Tube Combustion Chamber, 1271
View of Ireland (edited by James Meenan and David A. Webb), *review*, 488
Vigan, Dr. Bioclimatology and Biometeorology (Town Planning in relation to Climate), 1328
Vigier, Ph., and others : Internal Structure of the Virus-like Particles associated with the Rous Sarcoma, and their Presence in other Neoplastic and Normal Chicken Tissues, 386
Vigilance and the Inspection Problem (W. P. Colquhoun), 1331
Villanueva, Dr. J. R. : Spanish Fellowship renewed for 1957-58 by the Ramsay Memorial Trust, 316
Villar-Palasi, Dr. C., and others : Sensitivity of Pancreas Hexokinase towards Alloxan and its Modification by Glucose, 387
Villee, Prof. Claude A. (edited by) : Gestation—Transactions of the Third Conference, Princeton, 1956, *review* by Prof. R. A. McCance, 256
Villi (Chorionic) : Determination of the Sex of Human Abortions by Nuclear Sexing the Cells of the (Prof. A. C. Stevenson and R. H. McClarin), 198
Vincent, J. J. : Appointed professor of textile technology in the Manchester College of Science and Technology, 169 ; work of, 169
Vink, H. H., and others : Influence of Hexanitrodiphenylamine on the Incidence of Neoplasms in the Mammary Tissue of Rats, 509
Vinogradov, A. V. : Biological Role of Potassium-40, 507
Viral and Rickettsial Infections : Latency and Masking in (University of Wisconsin, the Rockefeller Foundation and the Wisconsin Alumni Research Foundation Symposium on), 788
Virial Coefficients of Vapours A Significant Error in the Determination at Low Pressures of the (Prof. R. Whytlaw-Gray and Dr. G. A. Bottomley), 1252
Virologica, Acta (Czechoslovak Academy of Sciences), Vol. 1, No. 1, 1170
Virulence (Mouse-) of Group A Streptococci : Enhancement of (J. Cameron), 1136
Virus (Beet Ringspot) Soil Transmission of, to Peach (*Prunus persica*), (Dr. B. D. Harrison), 1055
Virus (Fowl Plague) : Growth of, in Macrophages and Giant Cells (Dr. Richard M. Franklin), 510
Virus (Leaf-Roll) : Potato Blight and (D. E. Richardson and D. A. Doling), 866
Virus (Poliomyelitis) Changes in Cellular Nucleic Acids during Infection with, as studied by Fluorescence Microscopy (Dr. Esther Tenenbaum), 1044
Virus (Polyhedral), of *Heliothis armigera* (Hbn.) (Lepidoptera : Noctuidae), (Dr. G. H. Bergold and Dr. W. E. Ripper), 764 ; (Dr. Kenneth M. Smith and C. F. Rivers), 928
Virus (Polyhedral), of *Prodenia litura* (Fabr.) (Lepidoptera : Noctuidae), (Dr. G. H. Bergold and Dr. B. Flaschentrager), 1046
Virus (Rous Sarcoma) Development of Multiple Cysts and of Haemorrhagic Affections of Internal Organs in Albino Rats treated during the Embryonic or New-born Period with (G. J. Svet-Moldavsky), 1299
Virus (Tobacco Mosaic) : Chromatography of, on a Cellulose Cation Exchange Adsorbent (Prof. George W. Cochran, John L. Chidester and Dayna L. Stocks), 1281
  Ultra-violet Irradiation of Dry (Albert Siegel), 1430
Virus Diseases : Use of Insecticides for the Control of (Association of Applied Biologists Symposium on), 1454
Virus Filaments (Influenza) . Infectivity of (G. L. Ada, Beverley T. Perry and Margaret Edney), 1134
Virus Infections : Latent (Dr. C. H. Andrewes), 788
Virus Nucleic Acid (Tobacco Mosaic) : Terminal Groups of (Dr. K. K. Reddi and Dr. C. A. Knight), 374 ; (Dr. R. E. F. Matthews and Dr. J. D. Smith), 375
Virus Nucleic Acids (Cellular and) : Histochemical Observations on (Fluorescence Microscopy in the Study of Nucleic Acids), (Dr. J. A. Armstrong and Dr. Janet S. F. Niven), 1335
Virus-infected Mouse Brain : Metabolism of Pyruvate and α-Ketoglutarate in (P. L. Bradley), 1418
Virus-like Particles associated with the Rous Sarcoma : Internal Structure of the, and their Presence in other Neoplastic and Normal Chicken Tissues (Prof. Ch. Oberling, W. Bernhard and Ph. Vigier), 386
Viruses (Arthropod-borne) : Use of Goose Cells in Haemagglutination Tests with (Dr. J. S. Porterfield), 1201
Viruses (Raspberry Mosaic) : Transmission of, to the Strawberry (R. Stace-Smith and F. C. Mellor), 172
Visible Light : Effect of Ultra-Violet Radiation on the Respiration-Rates of Tobacco Leaves, and its Reversal by (Dr. P. C. Owen), 610
Viscera (Fish), *in vivo* : A 'Window' Technique for Observing (G. Burnstock), 1491
Vision : Colour (Dr. W. S. Stiles), 1395
  Retinal Chemistry and the Physiology of (Prof. G. Wald), 1395
Vision (Colour), of Achromats' Parents (Prof. R. W. Pickford), 926
Visiting Scientists, Society for : Discussion on Taste and Smell, 274
Visser, H. K. A., and others : Evidence of a Second Foetal Haemoglobin in the Newborn Goat, 758
Vistas in Astronomy (edited by Dr. Arthur Beer), *review* by Prof. André Danjon, 1308
Visual Aids, Educational Foundation for (Mullard, Ltd., and the) : Film 'Mirror in the Sky' awarded the Premier Award in the Films for Use in Schools Section of the Festival of Films in the Service of Industry, 891

Visual Images (Moving), produced by Regular Stationary Patterns (Dr. D. M. MacKay), 849
Visual Observation of Deoxyribonucleic Acid Changes in Bacteria during Growth of Bacteriophage (Fluorescence Microscopy in the Study of Nucleic Acids), (Dr. E. S. Anderson), 1336
Visual Phenomena associated with Regular Patterned Stimulation: Some Further (Dr. D. M. MacKay), 1145
Visual Pigment of a Decapod Crustacean—the Lobster (Prof. George Wald and Dr. Ruth Hubbard), 278
Visual Pigments: The (Dr. H. J. A. Dartnall), *review* by Dr. Ruth Hubbard, 1258
Visual Pigments and Depths of Habitat of Marine Fishes (Prof. George Wald, Paul K. Brown and Patricia Smith Brown), 969
Visual Problems of Colour (Symposium at the National Physical Laboratory), 1395
Visual Symptoms in *Hevea brasiliensis* of Deficiencies in Macro- and Micro-Nutrients (Dr. E. W. Bolle-Jones), 362
Visual Threshold: Noise and the (M. G. Balmer and C. I. Howarth), 1403; (Violet Cane and R. L. Gregory), 1404; (H. B. Barlow), 1405

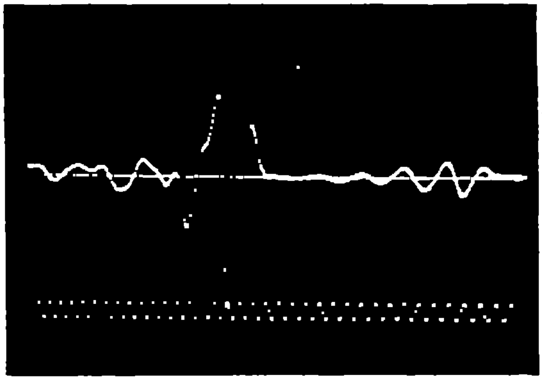
A new *extreme-speed* recording plate

The 'Kodak' Experimental Scientific Plate V.1015, a blue-sensitive material of extremely high speed, was introduced at the request of research departments who wanted a very fast material to record light of high intensity and short duration.

It proved to be the most satisfactory medium for the recording of high-speed c.r.o. transients and of rapidly-moving phenomena illuminated by ultra-rapid flash or spark. This plate has, therefore, been made available as a 'Kodak' Scientific Plate, in sizes up to 10 × 12 inches. It is now known as the . . .



Chopped wave neutral current taken on 17kV; sealed-off oscilloscope; sweep time 7·5 μ seconds; timing osc. 5 mc/s. The oscillogram was photographed using an f2.9 six-inch lens and an object-to-image ratio of 1/1.

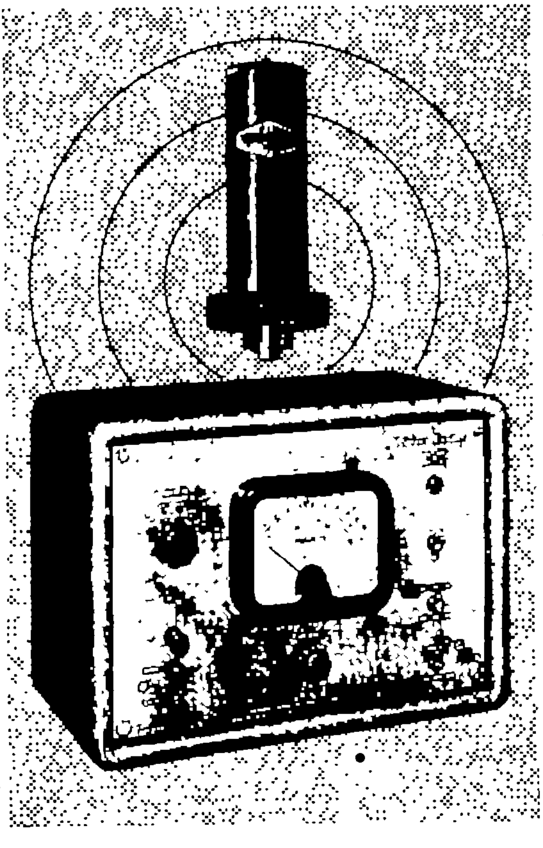
Reproduced by courtesy of Ferranti Limited, Transformer Department

FR **Kodak** *FLASH-RECORDING PLATE*

'Kodak' Scientific Plates offer the scientific worker a choice of more than 90 different combinations of colour-sensitizing class and emulsion type. They are normally produced to individual requirements, but where there is a steady demand for a particular combination, plates are kept in stock. Information and advice on the choice of photographic plates for specific purposes will be given with pleasure.

Kodak Limited, Industrial Sales Division, Kodak House, Kingsway, London, W.C.2. *'Kodak' is a registered trade-mark*

E.I.L.



The VIBRON

is a new electronic component, which replaces the electrometer valve in the measurement of very small currents.

The VIBRON is a vibrating condenser unit which, in a suitable circuit, can measure currents as small as 10^{-14} ampere, or resistances as high as 10^{14} ohms, to an accuracy of ±2% and with a zero stability of ±100 microvolts in twenty-four hours. It can be supplied as a unit for building into instruments of your own design, or, alternatively, VIBRON instruments of several types are available from E.I.L.: the Model 33B Electrometer shown here is an example.

Manufactured under British Patent No. 550610 and Patent Application No. 35637/54.

THE CASE FOR SCIENCE GREATS

OUR intellectual disciplines are drifting apart, leaving at the centre only a void that lays bare a fundamental weakness in our present-day civilization. In this situation, a key position is held by the universities, for, even if unwittingly, they determine what is taught in the schools; while they give to students much of the knowledge, and do a great deal to mould the sense of values and the thinking which they as graduates carry into public life.

Yet, at the universities, the various disciplines are becoming more and more vocational. At high pressure, men and women are being turned out who are experts in some particular field—lawyers, doctors, biochemists, engineers, geologists, teachers of modern languages, and specialists in European history. But the universities are doing very little to prepare their students to cope with the personal problems they will meet in everyday life; still less are they training them to take an active part in the affairs of the community and of the whole association of nations.

More than that, young people who are undecided about what they would like to do later, or who intend to embark upon some career that requires general and not professional training, are steadily being squeezed out. In other words, the universities are gradually renouncing what most people would still hold to be their primary function, which is not the production of various types of intellectual technicians, however essential they may be, but of people who at the highest level will be the true leaders of the nation, and indeed, of all humanity. Similar situations appear to be developing in various parts of the world.

Conditions were different in the past. The medieval schools of theology and philosophy occupied the central position where now there is a void; they were in close touch with the intellectual life of the nation, and they attracted the keenest minds. This tradition was taken over by the school of Classical Greats, at Oxford, as it grew up during the nineteenth century. That school has served as a magnificent inspiration to a number of highly gifted men who have made their mark in such fields as politics, the Church, education, and the higher Civil Service. But with its eyes turned to the riches of Greek and Roman literature, art and philosophy, it has been losing ground in recent years, while that of Modern Greats, based on the study of philosophy, politics and economics, has not fully taken its place.

The reason for this is easy to see. Even in Modern Greats the outlook is academic and bookish; the course fails to take count of developments in modern science, a force that is now transforming the world at an ever-increasing pace. It is often argued that science operates only with material things, yet its applications, repercussions and implications affect every aspect of civilization, whether they be economic, political, social, ethical, philosophical, or finally, spiritual. All these aspects, for example, are involved in the development of atomic physics, in mass-communications based on electronics, in the use of vaccination against poliomyelitis, and in the treatment of delinquents.

It is of the highest importance that every effort should be made to come to terms with science in all these various aspects, at the highest level, where its impact on civilization may be comprehended as a whole. That is something that the present departments of science, immersed as they are in their own sectional interests, cannot possibly undertake. What is needed is the institution of an entirely new discipline, which might take the form of Science Greats.

One can readily suggest some of the elements that ought to go to make up such a school. One would be the exact sciences, and their technological applications—for the applications of science are as important as pure theory. Another would be the life sciences; for while, apart from biology, they are still at a low level of development, they are rich in insights that penetrate to the personal relationships, impulses, motives and ideals by which men live. A third essential element would be history, but in its interpretation of the past it should make use of those insights we have just mentioned, for one cannot come to terms with the present world solely with the intellectual equipment of the past.

A fourth element should be philosophy. Education is sterile unless running through it is a coherent philosophical system and a goal; and it needs the driving-force of moral purpose. In this sense, our modern schools of philosophy are anæmic ghosts as compared with some of the great founts of wisdom and inspiration in the past. They have lost the urgency of a social purpose. Yet science presents enormous ever-expanding fields rich in philosophical implications, such as the light it is now throwing on the nature of matter and energy, on the origin of life, and on the question of responsibility in anti-social behaviour.

The goal of such a school should be the welfare of man—his material welfare, but also what is indissolubly bound up with it, his social welfare, together with his moral and spiritual good. The ideals of truth, goodness and beauty, which now have such a hollow ring in many university departments, could then be brought back into the domains where they belong, although in modern dress, in keeping with present-day requirements.

Above all, a school of Science Greats would differ from the corresponding ones of the past in drawing new ideas directly from research—not the painstaking searching of bygone texts for facts and interpretations that other readers have missed, but the *experimental* research which is the breath of science, and in which the outcome cannot be predicted. The spirit of that kind of research should permeate all its activities, and in the same way, research would need to be applied in the shaping of its future policies.

Similarly, its outlook should at all times be realistic and practical, not merely bookish and academic. The students would learn a great deal if they could see at first hand something of modern research in progress and finding application in industrial processes; if they could talk about the realities of life with housewives and trade union officials; if they could discuss philosophy with probation officers and biochemists.

Mention of these requirements leads to the question of the actual content of the teaching course. The supply of available factual matter and related principle is enormous, and far beyond the powers of comprehension of even the most gifted students. At the same time, the contention that the course would amount to nothing more than a jumbled smattering of disconnected subjects would need to be squarely faced. The syllabus would have to be highly selective, concentrating on the contributions of each of the separate disciplines which in the context of the school would be thought to be most representative and significant.

The necessity for selection would present the teaching staff with a problem that is central to the understanding of the place of science in the modern world; and the fact that they would be compelled to give it consideration would be one of the primary consequences of the establishment of a school in Science Greats. At present, this problem is being given thought only on an individualistic basis; within the school it would become a matter of continuing group discussion in circumstances favourable to its deeper comprehension and to the spread of attitudes that deeper comprehension would tend to generate. For the other university disciplines and for the nation as a whole that would be all to the good.

What students would wish to take Science Greats? In response to this question, one thinks of the men and women whose ambition it is to take an active part in public affairs, in politics, international relations, the diplomatic and consular service, in local government, social and welfare movements, and in the higher Civil Service. In addition, there are now many people holding executive positions in industry and commerce who do not require specialized professional training, but who badly need a conspectus of the world as a going concern in all the various aspects. Are they to be squeezed out of the universities and be made to feel uncomfortable at the grammar schools, above ordinary level? That is why, with suitable adaptations, one hopes that the supply of students would be large enough to justify the establishment of schools of Science Greats in British universities.

An interesting move in this direction is the recent suggestion put forward by the General Board of the Faculties of the University of Cambridge for a new Tripos examination. The proposals, which involve a two-year course in Arts subjects, followed by a special course in either the biological or physical sciences, cannot be discussed here. They show, however, that university circles in Britain are aware of the problems of fitting students for life in the modern world, and are prepared to consider ways of meeting them.

ADVANCES IN NUCLEAR PHYSICS

Progress in Nuclear Physics

Vol. 5. Edited by Prof. O. R. Frisch. (Progress Series.) Pp. vii + 325. (London and New York: Pergamon Press, Ltd., 1956.) 80*s.* net; 12.50 dollars.

THE fifth volume of O. R. Frisch's well-established series has appeared, containing seven authoritative articles on topics of current interest. The articles are on the determination of nuclear reaction energies by deflexion measurements, by W. W. Buechner; the inelastic scattering of fast neutrons, by Joan M. Freeman; new electronic techniques for the nuclear physicist, by K. Kandiah and G. B. C. Chaplin; the bubble chamber, by C. Dodd; the radius of a nucleus, by J. M. C. Scott; the neutrino, by B. W. Ridley; and organic scintillators, by F. D. Brooks. As in the previous volumes, the main emphasis is on experimental physics and several of the articles are devoted to experimental techniques. Scott's article on nuclear radii is the only one which gives a specifically theoretical treatment.

Two of the articles are concerned with 'low-energy' nuclear physics. Buechner reviews the ion optics of modern methods of producing mono-energetic beams and of analysing the charged reaction products, and discusses resolution, solid angle of acceptance, and calibration of the various electrostatic and magnetic systems employed in this specialized field, of which he is one of the principal exponents. Miss Freeman writes on a subject in which work of high precision is experimentally difficult, but which not only is important for nuclear spectroscopy but also has a practical bearing on the design of nuclear reactors. She reviews the experimental methods and results for the various inelastic processes which occur in fast neutron bombardment, and follows with a theoretical discussion.

Ridley's article on the neutrino is made topical by two events which occurred after it was written, namely, the discovery of free neutrinos and the excitement about the non-conservation of parity. He discusses the neutrino hypothesis in relation to beta-decay, *K*-capture, and meson and heavy meson decay, and reviews the experiments which have been performed and the theoretical background.

Scott gives a theoretical discussion of nuclear radii as determined by electrical methods, in which the charge distribution may in principle be obtained (mesic X-rays, electron scattering, isotope shift of atomic spectra, X-ray shift), considerations of the coulomb energy of nuclei (mirror nuclei and empirical formulae), and methods depending on nuclear forces (nucleon-nuclear collision cross-sections and barrier penetration). He concludes that the nuclear force radii are not, after all, much greater than the electrical radii when the finite range of nuclear forces is taken into account.

The remaining three articles are concerned with experimental techniques; a proportion of three out of seven is very reasonable in a series which has concerned itself mainly with experimental nuclear physics—major advances have been made in a diverse range of techniques, and further advances will be necessary if full advantage is to be taken of the new large accelerators. Kandiah and Chaplin present some recent developments in electronics, particularly in fast circuits and in simplified scaling systems. Appropriately, half the article is devoted to the transistor as a circuit element. Dodd reviews the progress of bubble chamber development; this elegant technique has been developed into an instrument of great power for high-energy physics, and is entering the realm of heavy engineering with the 72-in. chamber at Berkeley, California. However, commensurate effort is needed, and is beginning to be applied, on the problem of evaluating the mass of visual data produced with the bubble chamber, if the necessary good statistics are to be obtained; Dodd's article does not review this problem. Brooks discusses the present state of knowledge of the mechanism of scintillation in organic materials, and reviews recent data on the properties of organic scintillators—including liquid and plastic scintillators.

The authors have again maintained the high standard set by previous volumes in the series, and again they are all active workers in the fields which they discuss. As usual the quality of production is excellent, but this time there has been a longer delay in publication. The articles do not set out to be exhaustive, but are intended for specialists in related fields. The same characteristic is evident in the choice of topics in the whole series so far; no attempt is made to give frequent up-to-the-minute progress reports on all aspects of nuclear physics. In this way it has been possible to select topics in which a certain degree of stability has been reached, and the policy has been successful since the articles have not rapidly become out of date. However, rather few articles have so far been devoted to experiments in high-energy physics, in which much solid progress has been made during the past few years; perhaps we may see one or more articles on this important subject in the next volume. T. G. Pickavance

A COMMUNITY OF PENGUINS

A Population Study of Penguins

By L. E. Richdale. Pp. iii+195+2 plates. (Oxford: Clarendon Press; London: Oxford University Press, 1957.) 42*s*. net.

THIS book is the record of part of a most careful and painstaking field research extending over nearly a score of years on the penguins of New Zealand. The studies described here mainly concern the yellow-eyed penguin, ***Megadyptes antipodes***, a non-migratory species that is resident in the south-east of New Zealand and some of the adjacent islands; the colonies situated on the Otago peninsula where the author worked lie at the extreme north of the breeding range. None of the breeding areas studied lies more than twenty miles from the city of Dunedin where the author lives, and consequently he was able to visit them 1,318 times in the course of his work.

The observations recorded and analysed in this research were made chiefly on just over 400 birds divided almost equally between the sexes, and the results of 819 separate matings during eighteen seasons are traced. "The history of the individual resident penguins was well known to me. Sometimes the acquaintance lasted only one season, after which the penguin disappeared, but five birds were still present in 1953–54, seventeen seasons after they were first found." Recognition of the birds, of course, meant that it was necessary to mark them; "all adults and juveniles when first met were banded and footmarked, the latter device making it impossible to lose the identity of the bird should a band come off". But it is astonishing to read that when the author started his work in 1936 he was "unaware that wild birds were being banded in America and Europe", and that inquiries from "authorities in New Zealand" on how to band or mark wild birds led to nothing. The bands he eventually obtained from Europe were unsatisfactory and so, since the end of 1938, he has made his own although it takes fifteen minutes to manufacture each one. Mr. Richdale analyses and discusses the results of his field work with equal patience and care, and presents the most complete account of the population dynamics that has yet appeared about any species of penguin.

The author found that there was considerable wandering during the first five years of the birds' lives, but after that the penguins rarely adopted a new breeding place. Linked with this is the length of the pair-bond; there is a high rate of dissolution in youth, and in addition some older birds are unable to retain their mates because of incompatibility and the pressure of intra-sexual competition. "Once this period of instability is passed, 63 per cent of the pair-bonds on the average tend to remain intact in a succeeding season." It is not easy to sex living penguins, but one bird that was accidentally killed was dissected and, "because Yellow-eyed Penguins change their mates frequently it was possible by means of this one known bird to trace accurately the sex of every penguin that lived in that particular breeding area in the research period, both before and after the death of the bird".

As a result of his work the author was able to assess the precise composition of a penguin community and the proportions of juveniles, non-breeders and breeders, with, in many cases, their blood-relationship to each other, and the sex-ratio. Among many other matters, he also discusses the influence of age and other factors on breeding success, and the survival and mortality rates of juveniles and adults. A valuable chapter gives a detailed account of the process of moulting and compares that of the yellow-eyed penguin with what is known of the phenomenon in other species of penguin.

The book is produced according to the standards expected of the Press from which it comes and worthily presents an important contribution to ornithology. L. Harrison Matthews

SOIL IMPROVEMENT AND BETTER CROPS

Soil Fertility and Fertilizers

By Samuel L. Tisdale and Werner L. Nelson. Pp. xxii+430. (New York and London: The Macmillan Company, 1956.) 45*s*. net.

Farm Soils

Their Fertilization and Management. By Prof. Edmund L. Worthen and Prof. Samuel R. Aldrich. Fifth edition. (Wiley Farm Series.) Pp. viii+439+5 plates. (New York: John Wiley and Sons, Inc.: London: Chapman and Hall, Ltd., 1956.) 40*s*. net.

THE book by Tisdale and Nelson is essentially a product of North Carolina State College, which has a deservedly high reputation for its studies in plant nutrition and for its State advisory soil service. It is a presentation, for the student of soil fertility, of the fundamental principles of the subject, supported by a selection of experimental results. The text follows the usual sequence of historical introduction, a series of chapters on the factors affecting plant growth and the part played by those elements essential in plant nutrition, the sources and manufacture of the range of compounds used in soil amelioration and fertilization, the evaluation of fertility and the best practices in sound soil management.

There is little of a controversial character in the book, for its contents are a balanced and a clearly written exposition of up-to-date knowledge. For example, fertilizer recommendations are based on soil tests, about which much more space is given to the principles of the methods and the interpretation of the results than to details of technique ; the trace elements are adequately dealt with—although a little more information on the use of complexing agents might have been included—but not without arguments against their indiscriminate use ; the rapid development of more concentrated fertilizer compounds is discussed and the dangers of leaving out sulphates in the process ; there are full descriptions of the various methods of applying fertilizers, of salt effects, of the recovery of the nutrients in the crop, and of the fixation of potassium and phosphates and the changes undergone by soil nitrogen.

The conditions described are, of course, those found in the United States, and numerous data are provided to illustrate the trend of crop yields obtained by exploitation and conservation and the improvements of soils by management aimed at producing high yields. In this connexion it is interesting to record that in 1955, 25 per cent of crop production was attributable to fertilizers, that the bigger responses were obtained on the poorer soils, and that outstanding returns came from liming.

The very comprehensive table of contents is a particularly good feature for reference purposes, and it is a pleasure to see a proper chemical nomenclature displace the archaic terms of the fertilizer trade. The book is extremely well produced, and with its vast amount of useful information, will undoubtedly appeal to a wide range of people concerned with crop production.

However, the most urgent type of instruction, to the farmer who cannot be expected to master the background and vocabularies of the various sciences, is the distillation, in his own language, of the manners and techniques of the many new developments of recent years, and the book by Worthen and Aldrich, of Cornell University, one of the Wiley Farm Series, is a praiseworthy effort to put the subject of soils into a form that is quite comprehensible to anyone interested in soils, however little he knows of geology and chemistry. The emphasis is on the principles of soil management, coupled with that kind of information helpful for appreciating and applying recommendations from whatever source, and although the text has been prepared with an eye particularly on conditions in the north-east of the United States, there is something for nearly all farmers.

The book begins with a general description of soils and the parts played by parent material and climate ; it ends with chapters on soil maps, the zonal types and classification. The bulk of the text, however, is concerned with the handling and improvement of the soil and the best rotations for maintaining fertility. The measures required to control excess water and erosion, and to overcome water deficiency, are dealt with, and there is constant reference to tilth. The pronouncements on fertilizers, crop residues and farmyard manure are forthright, and this leads on occasion to over-simplification, but without serious sacrifice of scientific accuracy. The purist may shudder at the style of expression in places, but the American farmer, to whom the book is addressed, may not be troubled by such considerations. There are a very large number of photographs, tables and simple diagrams, a glossary and what appears to be a very full index, and the editing and printing are beyond reproach.

A. M. SMITH

DYNAMICS OF DIVORCE

Neurotic Interaction in Marriage

Edited by Victor W. Eisenstein. Pp. xv+352. (London: Tavistock Publications, Ltd., 1956.) 30s. net.

It is usually obvious that a person's reactions to a situation are dependent on how that situation has been met before. Thus, if a child is bitten by the first dog it tries to stroke, its behaviour when it encounters dogs in later life will be influenced by this first experience. It will behave differently from the child who found its first dog affectionate. Although most people are willing to accept this from daily observation, they are often unwilling to extend it to more complex matters ; as, for example, the child's reaction to people in later life being dependent on the behaviour of its father and mother. Yet these are usually the first human beings of whom it has intimate experience.

It has been found that the behaviour of the partners in marriage demonstrates the same mechanism. The husband unconsciously treats his wife as he learned to treat his mother, and the wife unconsciously behaves to the husband as her father taught her to behave to him. That such reactions can bring tension into the intimate contacts of marriage is only too obvious. The advent of children further confuses the issue.

This book is really a collection of studies by various American authorities on the dynamics of family life. It gives a valuable picture of the causes of marital distress, and the authors have had great experience in treating them. Suggestions for future research are also given.

It is impossible to describe every section at length but it is all well worth reading. Outstanding chapters are those by Mahler and Rabinovitch on "The Effects of Marital Conflict on Child Development", and by Eidelberg on "Neurotic Choice of Mate"; that by Mittelman on "Analysis of Reciprocal Neurotic Patterns in Family Relationships" is most interesting. The more difficult, and in some cases insoluble, problems are dealt with in the chapters on "Interaction between Psychotic Partners", by Jacobson and Bychowski, and "The Alcoholic Spouse" by Fox. As well as chapters on individual analysis, there are descriptions of what the Americans call 'casework' (which is more or less educational counselling) and group therapy. The application of the Rorschach tests to the partners in unstable marriages is an interesting development, and it seems that the Americans are working at research in the avoidance of grossly unsuitable marriages in the future. Anyone who deals with marriage, at least from the point of view of guidance, and therapy for marriages which are breaking should most certainly read this book.

It is usual to state piously that the stability of the nation depends on the family, but this is much truer than is usually understood. The stability of such organizations as the Army, church, and even trades unions, is only a reflexion of the family constellation, and this is exemplified by such terms as 'brother officers' and the use of the appellations 'father' and 'brother' in church and trades unions. The respect for authority and the manner in which we regard the State are only projections of our feelings derived from the family.

We spend a tremendous amount of money, both directly and indirectly, on broken marriages, divorce and their consequences: delinquency, neurosis, and, in some cases, psychosis. We cannot know too much about the nature of marriage and why it breaks down. The book is well written, with a good index, and none of the authors breaks out in the too blatant Americanisms which distract and annoy the British reader.

CLIFFORD ALLEN

CHEMICAL BASIS OF BLOOD GROUP SPECIFICITY

Blood Group Substances

Their Chemistry and Immunochemistry. By Elvin A. Kabat. Pp. ix+330. (New York: Academic Press, Inc.; London: Academic Books, Ltd., 1956.) 8 dollars.

THE greatly increased use of blood transfusion in medical practice during the past two decades has led to a rapid expansion in our knowledge of human blood-groups, and nine independent systems have been identified by serological methods. An understanding of the chemical basis of blood-group specificity has, however, lagged far behind the serological discoveries and even now it is not possible to assign a detailed chemical structure to any one blood group substance, or to define completely the smaller structural units within the complex macromolecules which confer on them their characteristic serological properties. Much progress towards this goal has nevertheless been achieved, and the present book by Elvin Kabat represents the first attempt to bring together all the existing information on the chemistry and immunochemistry of the blood group substances.

Isolation of the materials responsible for blood-group specificity from the red cell surface presents considerable technical difficulties and for this reason investigations on the chemical nature of the blood group substances have been almost entirely restricted to those group-specific materials which also occur in tissue fluids and secretions in a water-soluble form, that is, to the A, B, O(H) and Lewis (Le^a) substances. The major part of the book is devoted to a comprehensive survey of the methods used for the isolation, purification and chemical and immunochemical analyses of these water-soluble mucopolysaccharides. The author's own outstanding contribution to the immunochemistry of blood group substances has been the application to them of the quantitative precipitin technique developed by Heidelberger and his co-workers for the quantitative measurement of antigens, antibodies and complement, and the emphasis throughout the book is on this approach to blood group studies. Not all readers will agree with the author's low estimate of the value of results obtained by the hæmagglutination technique, which, although admittedly less precise, has a greater sensitivity than the precipitin method. Indeed the first indications of the simple structures responsible for specificity in both A and H substances were obtained by means of hæmagglutination inhibition experiments. The amount of experimental detail included seems rather excessive in some parts of the text and many of the long tables, which have been taken unchanged from the original papers, could with advantage have been given in a summarized form. The author has, however, reviewed the field with admirable thoroughness, the presentation is accurate and systematic and each chapter contains an extensive list of references.

This is essentially a book for the specialist and little concession is made to the general reader. It should nevertheless prove invaluable as an introduction for those entering the field of chemical studies on blood-group substances and as a reference book for immunochemists and biochemical geneticists interested in these serologically active mucopolysaccharide materials which are such excellent 'markers' in the field of human genetics.

WINIFRED M. WATKINS

LIGHT-SCATTERING AND MACROMOLECULAR CHEMISTRY

Light-Scattering in Physical Chemistry

By Dr. K. A. Stacey. Pp. viii+226. (London: Butterworths Scientific Publications; New York: Academic Press, Inc., 1956.) 40s.

IN 1944 Debye showed that the molecular weight and dimensions of a polymer in solution can be determined by the light-scattering technique. Since then a large number of papers on the application of this method to the study of macromolecules have appeared, and it is becoming increasingly popular as a routine technique for determining the weight-average molecular weights of polymers. Dr. Stacey is the first worker to devote an entire book to a survey of this new and important field, and in doing so he makes a timely contribution to the existing literature.

The book falls roughly into two equal parts, one dealing with the theory and practice of light-scattering relevant to this particular application, and the other with its use in the study of macromolecules. The first part is prefaced by a summary of the various methods for determining molecular weights of large molecules, and then the theory of light-scattering is developed in a way which emphasizes clearly the underlying principles. There is, however, a tendency to include short summaries of a large number of specific extensions of the theory when a more careful selection of the material would have allowed an improved presentation of the most important contributions. This half of the book is concluded by a very useful account of modern experimental methods. The remaining chapters are reserved for a review of the applications of this method in high polymer, protein and polyelectrolyte chemistry. Here again a large number of papers have been summarized, but little attempt is made to correlate or appraise the various contributions.

The author maintains that the time is not ripe for an authoritative monograph, but one feels that a more critical assessment of the present status of the light-scattering technique is required. The book does, however, contain some five hundred references to original papers published prior to 1956 and it will be of considerable value to anyone connected with the field.

G. ALLEN

An Introduction to Modern Organic Analysis

By Sidney Siggia and Hans J. Stolten. Pp. vii+250. (New York: Interscience Publishers, Inc.; London: Interscience Publishers, Ltd., 1956.) 4.50 dollars.

MOST modern books on analysis are necessarily specialized. They deal with only one type of approach to the problem and describe in detail the application of one technique or group of associated techniques. This excellent book, on the other hand, surveys the whole field of organic analysis and introduces the reader to the general strategy of the investigation of organic materials, discussing a few particular examples by way of illustration. Full working details are not, in general, provided, but at the end of each chapter one or two standard works and references are listed, from which the reader may obtain the necessary tactical details.

In successive chapters the principles and application of various methods of attack are described: elementary analysis; the determination of functional groups; potentiometric titration; absorption spectroscopy in the visible, ultra-violet and infra-red regions; polarography and X-ray diffraction. Analytical uses of freezing-point, refractive index and density are discussed. Various methods for separating mixtures are reviewed, including chromatography and ion-exchange, and brief mention is made of a number of more specialized devices. Although most of these subjects are dealt with very concisely, the sections on group analysis and on absorption spectrometry are particularly well done.

This volume was based on lectures to adult audiences and is not designed as a conventional student's text-book, yet it provides a most interesting and readable general introduction to the subject which should be of great value to graduates about to begin work as responsible technologists. It conveys a feeling of contact with real practical problems which is very stimulating. The book is well produced and illustrated and has an adequate index. It is remarkably good value for its moderate price.

G. M. BENNETT

Encyclopedia of Chemical Reactions

Compiled by Prof. C. A. Jacobson. Edited by Clifford A. Hampel. Vol. 6: Samarium; Scandium; Selenium; Silicon; Silver; Sodium. Pp. vii+438. (New York: Reinhold Publishing Corporation; London: Chapman and Hall, Ltd., 1956.) 100s. net.

THIS encyclopedia of chemical reactions is based upon reactions abstracted by some 100 abstractors from technical and scientific periodicals. The abstractors worked under the direction of Dr. C. A. Jacobson, lately professor of chemistry in the University of West Virginia, who had as his target a compilation of chemical reactions involving inorganic reagents. This volume deals with reactions involving samarium, scandium, selenium, silicon, silver and sodium. The information is very concise as the following example indicates. "Electricity makes silver react with carbon dioxide, forming silver oxide and carbon monoxide. $2Ag + CO_2 \rightarrow Ag_2O + CO$." The reference is W. R. Grove, *Phil. Trans. Roy. Soc.* (*London*), **142**, 94; 1852. Under the heading of sodium chloride on p. 273 an abstract informs the reader "Silver nitrate is added to the solution to precipitate any soluble chloride, as is well known, as silver chloride. Sodium is used as an example and the corresponding nitrate is also formed. $AgNO_3 + NaCl \rightarrow AgCl + NaNO_3$". The reference is W. Crookes, *Phil. Trans. Roy. Soc.* (*London*), **174**, 897; 1883. It would be unfair to leave the impression that the information is all of this vintage, but it is very doubtful whether these abstracts are worth the 100s. which is the price of this volume. The best advice for the prospective buyer is to see the volume before purchasing it.

W. WARDLAW

Crystallographic Data for the Calcium Silicates

By Dr. L. Heller and Dr. H. F. W. Taylor. Pp. vi+79. (London: H.M. Stationery Office, 1956. Published for the Department of Scientific and Industrial Research.) 10s. 6d. net.

THIS little book summarizes the results of a programme of research into the hydration products of cement sponsored by the Building Research Board. Almost all the known natural calcium silicates and a very wide range of artificial products were examined, and for each well-defined phase the authors give, so far as possible: X-ray powder data, optical properties, density, crystal-structure data, natural and technical occurrence, and short details of synthesis. The data appear to be carefully collected and checked, and the book should be a very useful summary for workers dealing with cement or boiler scales or with the calcium silicate minerals. In two appendixes a classification of the hydrated calcium silicates is attempted, with notes on their dehydration and on the structure types known in the group. A third appendix lists the spacings and intensities of the three strongest lines in the X-ray powder photographs of the phases described. The worst defect of the book is the lack of an index; in its absence, workers desiring to find out what is known of such 'doubtful minerals' as reyerite (p. 28), or the meaning of such old names as alite (p. 19), will probably fail to locate the information.

M. H. HEY

Table of the Fresnel Integral to Six Decimal Places

Compiled by T. Pearcey. Pp. 63. (Cambridge: At the University Press, 1956.) 12s. 6d. net.

THE Fresnel integral occurs in the solutions of a large number of diffraction problems, and it also frequently arises in other problems of theoretical physics. Despite the increasing availability of electronic computors, there is still a need for good tables of many functions; for often only relatively few numerical results are required, such as would not justify the expense of programming. Again, even when a calculation has been programmed, it is useful to check this by means of a desk machine computation. The present table gives:

$$C(u) = \int_0^u \cos \frac{\pi t^2}{2} dt, \quad S(u) = \int_0^u \sin \frac{\pi t^2}{2} dt$$

employing as the argument $x = \pi u^2/2$ — the definition of $S(u)$ on page 8 gives x, in error, as the upper limit. The use of x as the variable in place of u makes linear interpolation possible throughout most of the table, but it has the disadvantage that $x = 50 \cdot 00$, the final entry, corresponds to only $u = 5 \cdot 64$, so that beyond this relatively small value other tables or asymptotic series must be used. Between $x = 0 \cdot 00$ and $1 \cdot 00$ the entries are to seven places, and to six for the region $x = 1 \cdot 00$ to $50 \cdot 00$. Second differences are given throughout, together with a small table to facilitate their use. The table is clearly set out and very easy to use.

H. H. HOPKINS

THE INTERNATIONAL GEOPHYSICAL YEAR

By Dr. M. NICOLET

Secrétaire Général, Comité Spécial de l'Année Géophysique Internationale

ALTHOUGH the programme for the International Geophysical Year has been defined during meetings of the Special Committee of the International Geophysical Year, the ultimate responsibility for the completion of this extensive programme rests with the individual National Committees for the International Geophysical Year. There are two other factors that will control the course of events during the International Geophysical Year: first, the geographical conditions, which are one important element determining the nature of the essential observations; and secondly, the solar conditions, which will be an important factor in deciding to what extent the definitive programme can be carried through.

The programme of geophysical observations to be undertaken during the period July 1957–December 1958 is concerned with fourteen different disciplines. These can be considered in three main groups. The first group, which consists of geomagnetism, aurora and airglow, ionosphere and cosmic rays, requires continual solar observations and uses the most modern techniques, including rockets and earth satellites. It involves simultaneous synoptic observation for morphological studies and special observations to determine physical parameters at present unknown. In the sphere of morphological studies the stations of the first group will be distributed over the entire surface of the globe. This is why the distribution is based primarily upon a meridional distribution when following continents, and upon a latitudinal distribution for the arctic and antarctic regions, and the equatorial belt. These diverse disciplines concern phenomena depending on the geomagnetic field. For this reason the geographical possibilities are not necessarily the basis of the distribution of the observatories. In particular, auroral stations are to be found mainly in the zones where there is the greatest possible chance of observing auroras and where technical methods are more developed.

The second group involves meteorology, in which the network of stations has been developed with the view of obtaining a synoptic view of atmospheric phenomena in the lower atmosphere on a world-wide scale. Thus the meteorological system is spread out over the most distant regions in order to obtain for the first time observations covering the whole of the world.

The third group is composed of the rest of the various disciplines which are brought together in the International Geophysical Year in accordance with the most urgent and diverse interests. Thus the measurement of longitudes can assist with the analysis of radio-communications. The observations made in this group will be generally associated with the existence of modern astronomical observatories. Gravity measurements have been specially introduced with the view of obtaining measurements from regions not yet fully explored; and similarly for seismology, except that the programme is larger for this subject. Oceanography obviously has its own particular problems, and has been included in the general programme for co-ordinated study, but on a much larger scale than ever before. In this case the contributions of the National Committees are, of course, totally dependent upon whether the National Committee concerned belongs to a maritime or non-maritime nation.

Table 1. Meteorological Stations

Regions	Aerology	Radiation	Ozone	Atmospherics	Others
NA	116	65	11	11	17
NB	122	154	14	40	41

SB	14	6	4	1	—
SA	26	27	9	1	8
Totals	750	579	71	102	101

One subject which has only recently been added to the general programme is the measurement of nuclear radiation. This will include measurements of both natural and artificial radioactivity of samples of air, precipitation at the Earth's surface, solid particles delivered at the Earth's surface, observations of the activity of the upper air, of samples of varved ice from glaciers, and of sea water from the surface and also from various depths. It will be possible to make universal recordings of most of these types of radioactivity.

The programmes of the several National Committees will not be identical, because each contribution is dependent to a certain extent upon the geographical position and size of the country involved. At present there are more than sixty National Committees, which shows that practically every country in the world has been included. The only major exceptions are in the quadrilateral bounded by the Black Sea, the Persian Gulf, the Red Sea and the Mediterranean, where it has not been possible to make fully suitable arrangements; otherwise all the continents are covered by a network of National Committees, leaving no geographical area without an observational station.

a. Only semi-portable instrument.

b. Only storm magnetograph.

c. Only indicating equipment.

d. Magnetic station with at least normal registration of *D*-, *H*- and *Z*-components.

e. Other observations (quick-run recorder, or earth current, or rocket, etc.).

f. Total number of stations.

However, considering discipline by discipline, there are still deficiencies which in general cannot be filled for lack of men or suitable equipment. It is noteworthy that, generally speaking, it is not lack of financial means that limits the realization of certain programmes but rather the lack of suitable personnel to carry out the geophysical observations.

In a short review such as this, it is not possible to describe the contribution of each National Committee. Furthermore, during the past few months the programmes have undergone many changes due to recent technical developments. A list made in 1955 at the secretariat of the Comité Spécial de l'Année Géophysique Internationale gave the following information about the stations participating: meteorology, 559; geomagnetism, 196; aurora and airglow, 200; ionosphere, 236; solar activity, 82; cosmic rays, 100; longitudes and latitudes, 57; glaciology, 45; oceanography, 115; seismology, 70; gravity measurements, 66. To-day, at the opening of the International Geophysical Year, the number of meteorological stations is more than 1,600, and the combined total of the stations in all the other disciplines is not less than two thousand. This has

been due to a considerable effort during the past year, particularly on the part of the more recently appointed National Committees.

In order to give a clear view of the distribution of effort, the world can be conveniently divided into various zones which are based on both geographical and geomagnetic position. The CSAGI regions (see Tables 1–3) are defined as follows:

NA. Arctic Region: situated to the north of the 60th geographical or geomagnetic parallel.

NB. Part of the North Subauroral Zone: between the geomagnetic parallels 45° N. and 60° N., but not including regions of higher geographical latitude than 60° N.

NC. North Minauroral Zone: between the geomagnetic parallels 20° N. and 45° N.

CEN. Areas North of the Equatorial Belt: this region extends from geomagnetic parallel 20° N. to the geomagnetic equator.

SA. Antarctic Region: to the south of the 60th geographical or geomagnetic parallel.

SB. Part of the South Subauroral Zone: between the geomagnetic parallels 45° S. and 60° S., but not including regions of higher geographical latitude than 60° S.

SC. South Minauroral Zone: between geomagnetic parallels 20° S. and 45° S.

CES. Areas South of the Equatorial Belt: this region extends from geomagnetic parallel 20° S. to the geomagnetic equator.

Table 1 shows the distribution of meteorological stations. The stations are divided into various groups: (i) aerological stations; (ii) radiation stations; (iii) stations for measuring atmospheric ozone; (iv) atmospheric stations; (v) other stations, including stations making other measurements, for example, the chemical analysis of samples for water, carbon dioxide, etc. Surface meteorological stations have not been considered because these are part of the normal framework of observations.

Table 2 gives the total number of stations in all the other disciplines; the same geographical dis-

tribution is used. A glance at this table shows immediately that certain investigations are linked with geographical regions; for example, glaciological investigations are particularly concentrated in the arctic and antarctic regions. In the other regions, observations are dependent on the presence of glaciers. From another point of view, observations of an astronomical character such as longitudes and latitudes, or even solar observations, are essentially based on the existing observatories. These tend to be concentrated in the northern hemisphere in the region of the middle latitudes.

However, it is impossible to regard all stations as being of equal importance, because within each discipline there are profound differences in the type of observations. In meteorology, for example, an aerological station will make at least radiosonde observations, while a radiation station need only have simple apparatus for measuring the total radiation, and the results obtained may not be very accurate. On the other hand, rockets, which numerically make the smallest contribution to the International Geophysical Year programme, represent an effort so much in excess of their numbers that only four National Committees, namely, Japan, the United Kingdom, the United States and the U.S.S.R., have been able to participate. The U.S.S.R. rocket and Earth satellite programme was presented to the Bureau of the Comité Spécial de l'Année Géophysique Internationale on June 16, 1957. A total of 125 rockets will be launched; of these, 25 will be fired in the Arctic, from Franz Joseph Land, 70 from the middle latitudes of the Soviet Union, and 30 from the region around Mirny in the Antarctic. The firings will be made at approximately regular intervals, mainly on World Days and Special World Days.

It may be interesting to point out how the observations being undertaken in one of the disciplines are subdivided. Observations of auroras can be visual, photographic, spectrophotometric, spectrographic or radioelectric, and the various techniques are essentially different. There will probably be more than two hundred stations observing auroras visually, to which can be added other observations made by meteorological stations and by amateur astronomers. In addition, there will be 104 all-sky cameras, which will make possible a continuous photographic record of auroras so far as clear skies allow, and of these fifty-nine will be in the Arctic region. The number of spectrographs will be about thirty-six, of which fifteen will be in the Arctic and nine in the Antarctic.

It is impossible to write in detail about the many subjects under investigation when giving an impression of the contribution of each National Committee organizing observations during the International Geophysical Year. However, geomagnetism may be taken as a typical example. Table 3 gives the schedule prepared for certain regions by various National Committees. There will be, according to this programme—which is, of course, an essential part of the Year's programme—178 geomagnetic stations registering the three components, D, H and Z. With regard to the numbers given in column a, these are not very significant, because the number of stations based on a portable instrument is practically unlimited.

Among the most remarkable efforts to be undertaken during the International Geophysical Year, the observations to be made in the polar regions are probably the most spectacular. The stations and observations that will be carried out in the Arctic are given in Table 4, and those in the Antarctic in Table 5.

This outline of the projected activities of the International Geophysical Year, though lacking in detailed description, nevertheless indicates a scientific reality of great magnitude. The whole object is to integrate a series of observations which require international co-operation on a scale never before realized. This has been achieved by a number of round-table talks, in which some of the world's leading astronomers, geophysicists, meteorologists and others have proposed, discussed and then agreed on suitable programmes. Finally—and this is the most important—it shows that a practical solution to the problems of modern science can only be found by mutual contributions to the task, as is illustrated so well by the efforts of the National Committees contributing to the International Geophysical Year.

GEOPHYSICAL INVESTIGATIONS ON THE FLOOR OF THE ATLANTIC OCEAN IN *DISCOVERY II*, 1956

A DISCUSSION meeting concerning the geophysical investigations made in the Atlantic from R.R.S. *Discovery II* in 1956 was held in the rooms of the Royal Society on May 2. Sir Cyril Hinshelwood, president of the Royal Society, was in the chair and the meeting was introduced by Sir Edward Bullard. He described the track (Fig. 1) of *Discovery II* on the cruise and the type of investigation which was made. While the ship was on passage continuous echo-sounding profiles and total force magnetic measurements were obtained. The station work consisted of seismic refraction shooting experiments, measurements of the heat flow through the ocean floor, coring, dredging, bottom photography and detailed magnetic and topographic surveys in a few limited areas. In addition to this, one measurement was made of the deep current at a depth of 3,000 m.

The scientific personnel on the expedition consisted of Mr. R. D. Adams, Sir Edward Bullard, Mr. J. C. Cleverly and Dr. M. N. Hill from the Department of Geodesy and Geophysics at Cambridge, Dr. R. G. Mason and Mr. F. Gray from the Imperial College of Science and Technology, Dr. A. S. Laughton and Dr. J. C. Swallow from the National Institute of Oceanography, and Prof. R. W. Raitt of the Scripps Institution of Oceanography in California, and Dr. T. F. Gaskell of British Petroleum Co., Ltd. The last two were each present for half the cruise.

An important new technique was used on the detailed surveys; this consisted of the mooring of dan buoys with radar reflectors on them in deep water. This allowed a better control of position to be obtained than is possible with astronomical sights alone. The new types of investigation used on the expedition were the photography of the sea-bed with

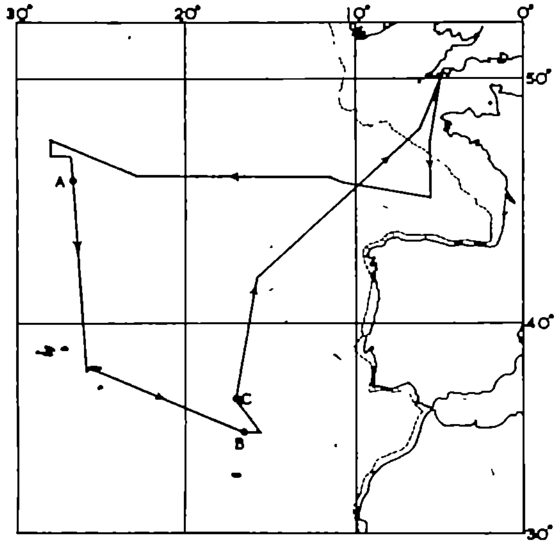

Fig 1. Track of *Discovery II* during July and August 1956. Points *A*, *B* and *C* show where buoys were moored

Dr. A. S. Laughton's camera and the measurement of the Earth's total magnetic field with a towed nuclear-spin magnetometer.

Sir Edward completed his introductory remarks by acknowledging his gratitude to Dr. G. E. R. Deacon, director of the National Institute of Oceanography, for providing six weeks of *Discovery II's* time for these investigations.

Dr. M. N. Hill gave a brief description of the topography of the area of the Atlantic in which the recent investigations and those of earlier expeditions have been made. The area can be sub-divided into four different types of topographic terrains. First, to the north there is the extensive, comparatively shallow smooth area lying to the west of Scotland and extending to Iceland and Greenland. Secondly, there are the abyssal plains lying close to the foot of the continental shelf at depths of about 2,500–2,900 fathoms; these plains are isolated from one another by ridges and are generally flat to within a few parts in ten thousand and stretch out to a distance of approximately two to three hundred miles from the foot of the continental slope. The third type of topography lies to the west of the abyssal plains; it is shallower and consists of gently sloping areas with seamounts and ridges sticking up through the sedimentary cover. In width this third type is again about two to three hundred miles. Farther to the west, and centred about the line of 30° W. longitude, lies the Mid-Atlantic Ridge where the bottom topography is precipitous, with no extensive flat or smooth areas. The Ridge width is variable but is again in the neighbourhood of 300 miles. The minimum depth to the higher peaks of the Ridge is about 600 fathoms and the mean level in the middle about 1,300 fathoms.

In the middle of the Ridge and roughly following its axis there is a deep valley approximately 1,800–2,200 fathoms in depth. The floor of the valley is about five miles across, and between the tops of the ridges forming its sides the width is about 10 miles. This valley was discovered in cruises of H.M.S. *Challenger* by Dr. Swallow in 1953 and since then some detailed surveys have been made of restricted parts of it. Its length is at least 85 miles and it seems to be blocked at its southern end in about latitude 47° 20′ N. To the north its limit is not known. In the 1956 expedition the investigations were undertaken near its southern limit. Prof. M. Ewing has suggested that this valley exists with occasional breaks in it throughout the length of the Ridge from 55° N. lat. down to the latitude of Cape Town and that it there swings to the east and continues up the ridges in the western Indian Ocean. There is some support for this suggestion in the limited sounding information available, but its continuity is open to much doubt.

Dr. A. S. Laughton was the next speaker and he described the method of photography of the sea-bed which he has developed. The camera and flash tube are mounted on a framework of scaffold tubing and are arranged with the camera sufficiently far above the light source to allow for photographing of the shadows behind smaller objects lying on the sea-bed. The camera is operated by a weight hanging about 10 ft. below it. When this weight touches the sea-bed it triggers the flash and operates switches, one of which winds the film and another transmits a sound pulse back to the surface. This sound is a signal for the camera to be lifted clear of the bottom. Because of the drifting of the ship, subsequent lowerings will photograph different areas of the sea floor; up to one hundred photographs can be obtained before the camera need be brought back to the surface.

This camera was used at numerous positions during the cruise at depths between about 60 fathoms and 2,650 fathoms, and in all two hundred black-and-white photographs were obtained.

The most interesting series of photographs were those obtained from a seamount (Position *B* on Fig. 1) at the south-eastern corner of the track which was surveyed in detail. These demonstrated the existence of loose boulders on the sea-bed near the top of the seamount, outcrops of rock and pockets of sediments on the flanks (Fig. 2). In the deeper water there are oceanic sediments which, as was usually found elsewhere, are covered with numerous indications of the existence of bottom fauna. These photographs were all of great interest in relation to the rocks obtained by dredging in the area and to the topography obtained by the echo-sounder.

Mr. R. D. Adams, of the Department of Geodesy and Geophysics at Cambridge, who was to a large extent responsible for the seismic refraction shooting experiments undertaken during the cruise, described the seismological investigations he had made before and after the cruise. These were related to the refraction shooting results, since, by studying the Rayleigh and Love waves from earthquakes in the Mid-Atlantic Ridge, it was possible to learn some details of the average crustal structure below the Atlantic Ocean. The earthquake epicentres of the Ridge lie along the axis and exist throughout the length of the Ridge. Adams discussed the results from earthquakes from the northern part of the Ridge picked up at Kew and on the long-period seismographs at Cambridge.

It has previously been suggested by Prof. J. P. Rothé that on the eastern side of the Ridge the crustal structure is nearer that of the continents than on the western side and in other oceanic areas. This is not substantiated by the dispersion results obtained by Adams, which showed that, after the effects of the continental part of the track had been removed from the observations, the results were indistinguishable from those obtained from other oceanic areas.

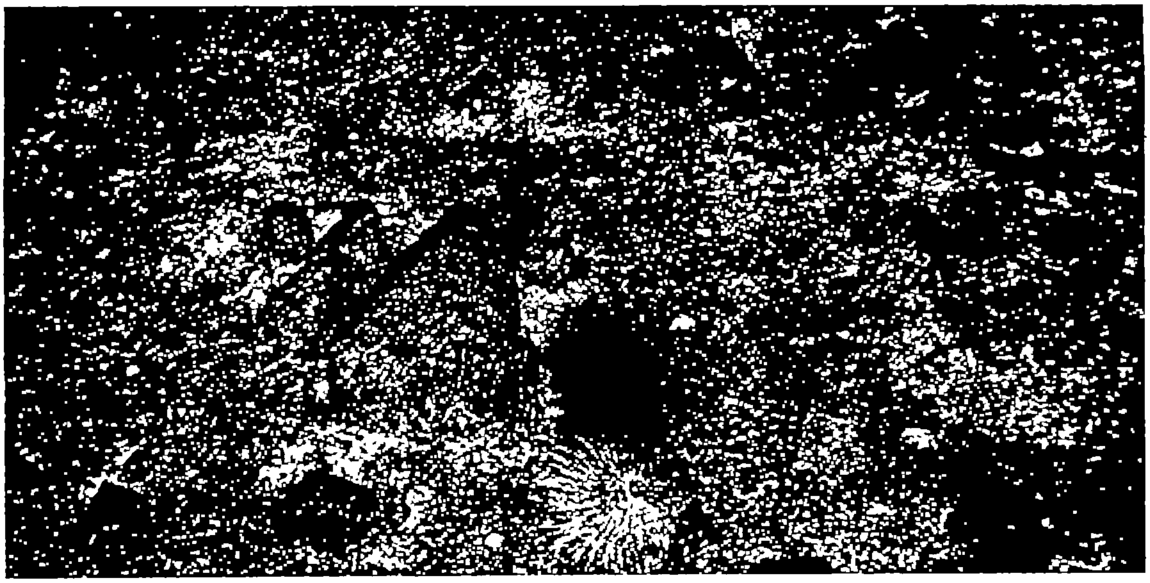

Fig. 2. Loose boulders and some outcropping bedrock near the peak of a volcanic seamount north of Madeira. In the foreground is a spiralling Gorgonid. The depth of water was 800 fathoms

This conclusion agreed with the seismic refraction shooting results. Adams pointed out that interesting results concerning the Mid-Atlantic Ridge structure might be obtained from the installation of longer period seismographs in the Azores than those at present in use; the surface waves were not at present being recorded.

Dr. M. N. Hill gave a brief summary of the seismic refraction shooting results obtained from those areas, largely in the Atlantic and Pacific oceans, in which this type of measurement has been made and compared them with those obtained in the north-eastern Atlantic. The top layer (Layer 1) consists of unconsolidated sediments (compressional wave velocity 2 km./sec.) which in water depths greater than about 2,000 fathoms has an average thickness of approximately 350 m. This overlies a layer in which the velocity of compressional waves lies between 4 and 6 km./sec. and which has a mean thickness of about 1·6 km. This layer is difficult to identify; near volcanic islands it appears that it can be associated with lavas, but its existence in all areas makes it doubtful whether this interpretation can be true over all the sea floor. The velocity in it is such as might be expected for consolidated sedimentary rocks and it is possible that time and pressure have produced the necessary cementation or compaction of the deep sea sediments to produce this layer. The layer below this has a compressional wave velocity of 6·7 km./sec. and is usually supposed to represent basaltic rocks. Its thickness varies with location but in the deeper water it is approximately 4 km. thick and overlies the mantle rocks, which have a compressional wave velocity of 8·1 km./sec. This velocity is very close to that found at the Mohorovičić discontinuity at a depth of about 30 km. under the continents.

In the north-east Atlantic, seismic refraction shooting observations during the past years have been made at more than thirty different positions and with a few exceptions these results conform with those obtained elsewhere. The first exception exists in the relatively shallow northern area mentioned earlier, where the thickness of the unconsolidated sediments is considerably greater than elsewhere, being in the neighbourhood of 2 km. This thickening is possibly associated with the erosion products of the Pleistocene glaciation. The second exception is on the three seamounts and in the shallower water near the Azores, where there appears to be an additional layer, with compressional wave velocity about 3·8 km./sec., between the unconsolidated sediments and the layer usually lying below, which has a velocity in the eastern Atlantic between approximately 4·5 and 5·4 km./sec. This layer with velocity 3·8 km./sec. can with fair certainty be associated with volcanic lavas.

In the recent expedition a series of observations was made at increasing distances from the Azores, and these showed that apart from the changes in water depth, and a thickening of the unconsolidated sedimentary layer in the shallower water, the structure was similar to that found elsewhere. In these measurements the method did not allow the depth to the layer with velocity 8·1 km./sec. to be determined.

From the seismic observations obtained on the recent cruise of *Discovery II* and those obtained by Swallow and Hill on previous expeditions, it appears that the eastern Atlantic differs to no marked extent from the Pacific or the western Atlantic. Hill concluded his remarks by suggesting that those who favoured the hypothesis of continental drift in comparatively recent geological times would have difficulty in reconciling their conclusions with the crustal similarities between the Pacific and Atlantic Oceans.

Dr. M. N. Hill next described the nuclear spin magnetometer which had been constructed for towing astern of *Discovery II* during the expedition. This magnetometer relies upon the measurement of the precessional frequency of the spin axes of protons, the magnetic moment vectors of which have been displaced from alignment with the Earth's field and which are realigning themselves. The displacement of the protons in a water bottle is produced by a polarizing field not aligned with the Earth's field. This polarizing field is derived from a coil around the bottle; the coil is also used to detect the small alternating magnetic field (which is about 2,000 c./s. in the latitude of Britain) produced by the processing protons. The processional frequency is directly proportional to the total field through the water sample. The advantages of the instrument are that calibration is unnecessary since the gyromagnetic ratio for the protons is known, and also that orientation of the bottle is not of importance provided its axis is not close to the direction of the Earth's field. This means that the object to be towed can be smaller than that of, for example, the towed fluxgate magnetometer. The body of the magnetometer used in the recent cruise was 5 ft. in length and 5 in. in outside diameter and was towed approximately 300 ft. astern. The electrical equipment necessary for the measurement of the processional frequency was installed in the ship.

Sir Edward Bullard described the total force magnetic measurements which were obtained with the nuclear spin magnetometer and with the fluxgate magnetometer on the recent cruise. One of the first interesting observations which resulted from these magnetic measurements was that which suggested that the Hercynian folding forming the Brittany Peninsula extended out to sea. A crossing of the line of its axis extended out over the continental shelf was obtained early in the cruise and another on the return voyage to Plymouth; and both showed a considerable positive magnetic anomaly. Apart from this anomaly, the continental shelf and slope were magnetically smooth compared with the deeper water, where even in areas topographically flat considerable anomalies with a wave-length of the order of 12 miles were constantly observed. Even where there was some relief on the ocean floor it was not obvious if there was an association between these long wave-length anomalies and the topography. Superposed upon these long wave-length anomalies were those of about 2-miles wave-length which could sometimes be associated with topographic features.

Detailed magnetic surveys were made of the two seamounts where dan buoys were moored; although there appears to be some correlation between the depth and magnetic contours, it is not as good as would be expected if these seamounts, from a magnetic point of view, consisted of lumps of magnetic material placed upon the sea floor.

Dr. J. C. Swallow described the deep water current measurement which had been obtained on the cruise. The method consists of loading aluminium alloy tubes so that at the surface they are slightly negatively buoyant. Since their compressibility is less than that of water, it can be arranged by suitable weighting that they reach a known depth where they possess neutral buoyancy. The tubes contain electrical sound-making devices which allow the floats to be followed for some days. Their position is determined relative to a fixed topographic feature of the sea floor. With the observations made on this cruise the current at 1,640 fathoms was found to be approximately 0·8 cm./sec., or less than half a mile a day. The position of the observation was near the south-eastern corner of the track of *Discovery II* and the depth of water about 2,800 fathoms. Dr. Swallow considers the magnitude of this bottom current to be so small that it may represent 'noise'; in order to obtain a more reliable estimate of the permanent current, observations would have to continue for a longer period than two days (see also *Nature*, 179, 1183; 1957).

Prof. W. F. Whittard spoke about a preliminary inspection he had made of the basalt boulders dredged from a seamount. These appeared at first sight to be weathered, since among other characteristics these rocks were exceptionally friable. It was difficult to understand how they could have got into this condition while resting on the floor of the deep ocean. Whittard also remarked that small pebbles dredged from the northern part of the Mid-Atlantic Ridge largely consisted of limestones and acidic igneous rocks. He expressed doubt if these could all have been ice rafted.

Mr. A. R. Smith reviewed previous work on cosmic spherules derived from atmospheric dust collections and ocean sediments. He mentioned two recent theoretical indirect lines of investigation which suggest that there is an abundant supply of these spherules in space and that they can get through our atmosphere undamaged. He outlined an experimental programme which he is carrying out at Cambridge on the deep-sea cores obtained from the recent cruise. It is hoped that it will be possible to devise a positive method of identification of these spherules and to find out something about their density and composition, and their distribution in space.

In the discussion Dr. G. E. R. Deacon expressed satisfaction that *Discovery II* proved so versatile that the measurements described could be satisfactorily undertaken. It spoke well for the design of the ship that after nearly thirty years service she was still suited to modern techniques.

M. N. HILL

THE UNIVERSITY OF READING

By SIR JOHN WOLFENDEN, C.B.E.
Vice-Chancellor

THE University of Reading is on the move, literally as well as metaphorically. The new building in Whiteknights Park which Her Majesty The Queen, accompanied by Prince Philip, recently opened is the first outward and visible sign of an imaginative and far-reaching plan of development. When this plan is completely realized the University of Reading will have a material equipment which will not easily be surpassed by any other University in Britain.

The original home of the University Extension College was in the heart of the town of Reading. It was a cluster of municipal buildings (some of which have to-day become part of the Police Station) provided by the Borough Council to meet the needs of adult education as it was understood in the 1890's. The site was cramped, the buildings quickly became inadequate, and the atmosphere was inappropriate to the academic ambitions which the principal, Dr. W. M. Childs, and his colleagues properly cherished.

The energetic enthusiasm of Childs and the generous faith of Alfred Palmer made an irresistible combination. Between them they brought it about

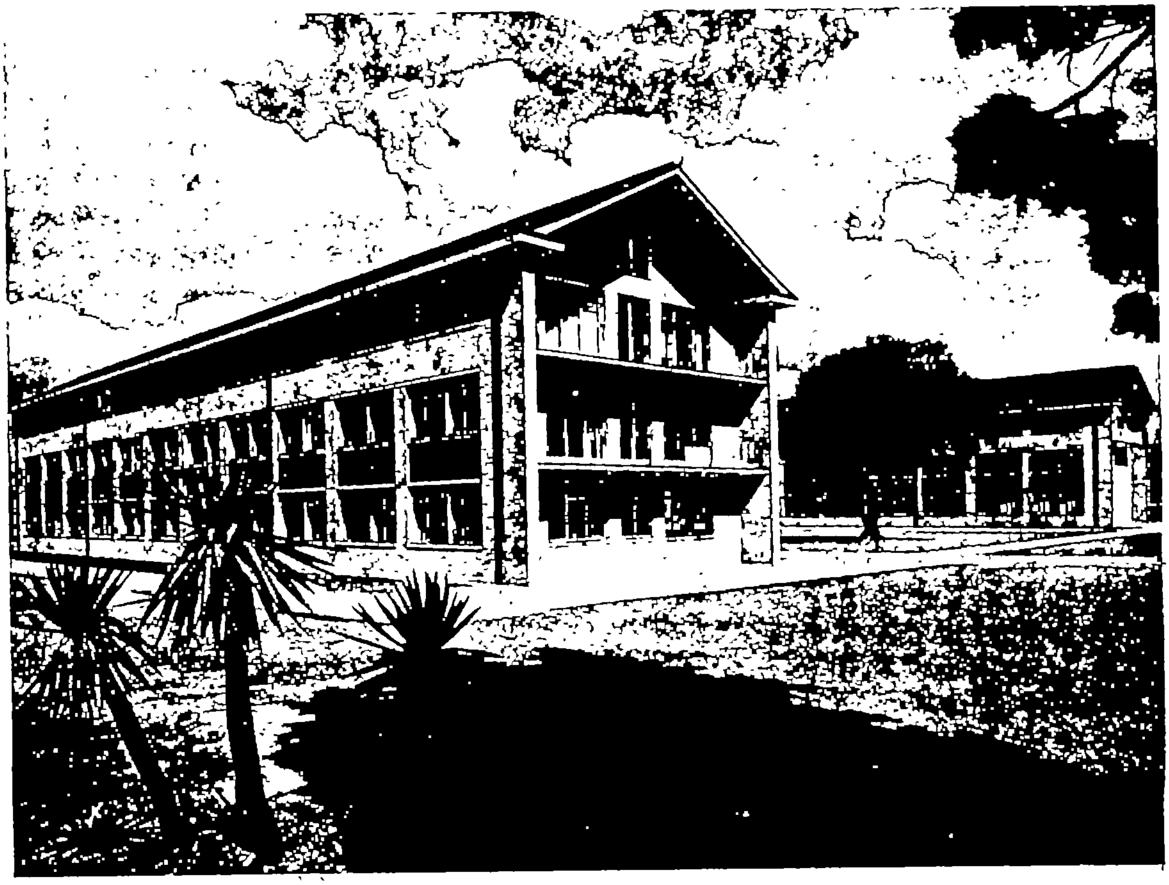

Fig. 1. Faculty of Letters: Main Building

that the College entered into possession of a substantial area of Palmer property, and to it the College moved in 1906. This London Road site had (and has) many attractions. Few of those who drive through Reading on their way from London to Bath realize either that a row of modest Georgian houses is the frontage of the University of Reading or that immediately behind those houses there are gardens and trees of a beauty and freshness quite unexpected thirty yards from a trunk road. Yet it is here that the University has lived, in simple dignity, for fifty years. The buildings, the open cloisters and the gardens themselves have made their impression on generations of students and have rightly earned their affection.

But year by year the pressure on space has inexorably increased. For Childs "There was room here to spread ourselves, and to house our work without overcrowding". But even by 1939, though, by comparison with other universities, Reading was still small, it was clear that the London Road site was no longer adequate. New departments and new needs had encroached on the lawns of the old gardens, and proper development was cramped for lack of space. The post-war demands for university expansion brought these difficulties to a head. It was simply impossible to meet them in surroundings which had been palatial for an infant college but were quite insufficient for a thriving and growing University.

In 1947 an opportunity arose, with dramatic unexpectedness. It was boldly seized, by the foresight of the then vice-chancellor, Sir Frank Stenton, and the University Council of the day. Whiteknights Park, an estate of three hundred acres on the southern fringe of the town, came into the market. The planning authorities, which had scheduled it as a permanent open space, generously agreed that it should be used for University development, and the first steps in a comprehensive scheme were taken. The University Grants Committee and the Treasury made their indispensable contribution, and the practical problems of planning were taken in hand. Architects were appointed, a site-plan was drawn up, and the University set itself the exciting task of working out its order of march from the London Road to Whiteknights Park.

It was inevitable that there should be delays and frustrations. Priorities change even in a period of ten years, specially when those ten years are as eventful as the last decade has been, both in public affairs at large and in the affairs of the universities of Great Britain. But on two important points there has been no departure from firmly held policies. First, the University is resolved that the beauty of Whiteknights Park should not be damaged, but should be positively enhanced, by the building of a university on it. The estate is a typical piece of English parkland, with pleasant contours, admirable trees, an interesting lake, and an attractive air of naturalness. The University is very conscious of its beauty, and of the obligation to pay full regard to it. The precise siting of buildings has been done in such a way as to preserve individual trees and to make the most of the existing background. There is no intention to sweep away what is already there and to start from a *tabula rasa*: Hundreds of new trees

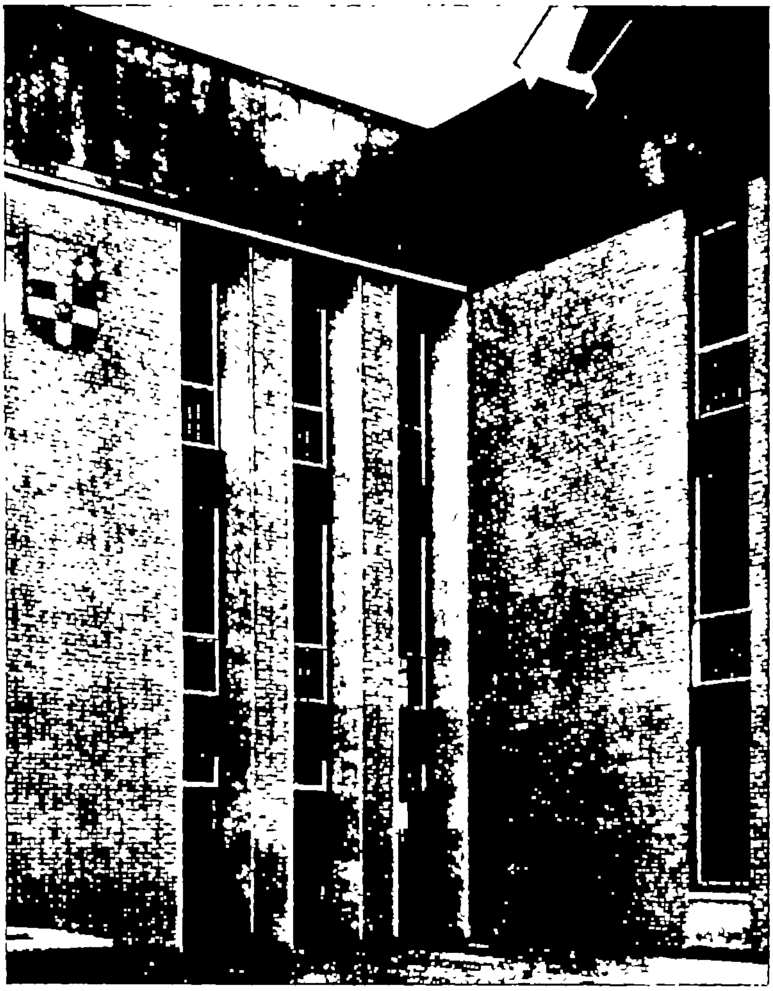

Fig. 2. Faculty of Letters: Main Entrance

have been planted—many of them a gift from the chancellor, Lord Templewood.

The University's second determination is that its organic life shall not be split in two by the gradual transfer from one site to another. Clearly, a move of this kind will take many years to complete, and during that time part of the University will be in Whiteknights Park while a diminishing part stays in the London Road. This problem is not unfamiliar in the history of university development, and there are lessons which Reading is gratefully learning from its sisters. But both its senior members and its student body are alive to the dangers of schizophrenia (or schizosomatosis) and resolved that topographical separation shall not mean disruption or divorce. The actual distances involved are not immense, by the standards of towns bigger than Reading; three-quarters of a suburban mile is not a sabbath day's journey.

In the autumn of 1954 Sir Frank Stenton cut the first turf on the site, and as he did so the first machines rolled on to the first building area. In May of 1955, Lord Templewood laid the foundation stone on a typical summer day of hail, thunder and torrential rain. On March 22, 1957, Her Majesty formally opened the first new building, in brilliant sunshine.

This building houses the Faculty of Letters. It concentrates the Departments of Philosophy, Classics, English, Italian, German, Political Economy, French, Modern History and Mathematics. Geography and Psychology, Departments which have one leg in the Faculty of Letters and one in the Faculty of Science, remain for the present with their scientific colleagues on the old site. There are common rooms, for academic staff and for students, lecture rooms, two departmental museums, and a private room for each member of the academic staff. The building contains a small theatre, inaugurated in March with a presentation of "King Lear".

It is a three-story building with a total area of approximately 65,000 sq. ft. It is a steel-framed structure with hollow block concrete floors and a low-pitched copper-covered roof. The external walls are built in Buckinghamshire Brown-Grey facing bricks, and the window panels are faced in Verde Oliva and San Stefano marble. The window frames are aluminium, set in African mahogany sub-frames.

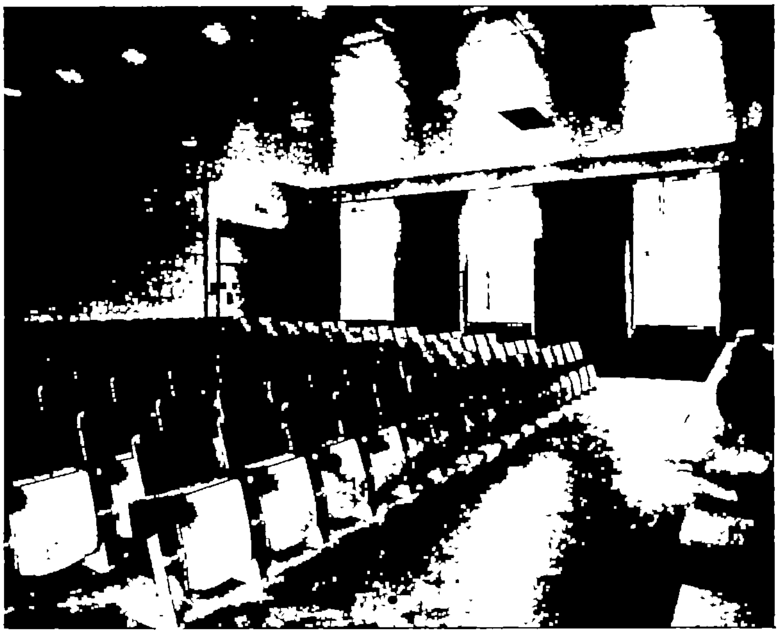

Fig. 3. Faculty of Letters: Theatre

Internally, the wall finish is mainly fairface brickwork, Uxbridge Flint facing bricks being used for this purpose. Wood block flooring is extensively employed, although to reduce noise the corridors are finished in 'Korkoid'. The main entrance hall and staircase are paved in 'Travertine', and the columns in this area are faced in San Stefano and Ashburton marble.

The building is heated by means of Frenger Acoustic heated ceiling, a comparatively recent development consisting of perforated aluminium panels clipped to a continuous grid of heating pipes. The lighting throughout is by tungsten fittings, with the exception of the Classics Museum, which has fluorescent ceiling fittings and concealed tubes in the showcases.

The Departments of the Faculty of Letters are housed in the two long wings, each served by a subsidiary staircase. Nine lecture rooms are grouped in the centre block. Of these, seven are arranged to seat fifty students each, one to seat seventy-five, and one to seat a hundred. This last has a raked floor, and a projection room, which also serves the lecture room accommodating seventy-five.

In addition, on the first floor there is a fully equipped theatre with seating for 173 persons. This is approached directly from the main entrance hall and staircase. Underneath this theatre, on the ground floor, the main lavatory and cloakroom accommodation is grouped.

All the lecture rooms, and certain of the department rooms, are equipped with revolving or fixed blackboards, and in many of them a pull-down projection screen is also fitted. Special provision has been made throughout the building for the use of portable blackboards and display boards.

The two main common rooms, one for the academic staff and one for students, are located on the ground- and second-floors respectively, each with kitchen facilities. The academic staff room opens on to a paved terrace.

The architects are Messrs. Easton and Robertson and the quantity surveyors, Messrs. Hamilton H. Turner and Son. Consultants for the heating services, drainage work and landscape work are, respectively, Messrs. Donald Smith, Seymour and Rooley, Mr. Daniel Longden and Miss Mary Braendle. The builders are Taylor Woodrow Construction, Ltd.

By a triumphant combination of imagination and practical skill this quite large building sits comfortably and almost unobtrusively in its parkland setting. From every window in it there are trees and sky to be seen, and inside it there is an agreeable air of spaciousness and quiet. It succeeds in being friendly and domestic without losing dignity. The development of the Whiteknights Park estate has got off to a good start.

But, of course, this is only the first move. It has set the tone and pace, but it is really only a foretaste of the whole that is to be. The next moves promise to be no less exciting and no less arduous. Plans are well advanced for the two next buildings. They are to be a Hall of Residence and the Department of Physics.

It is natural that, in Reading especially, a new Hall of Residence should stand high on the priority list. On grounds of policy and of practical need, Reading has from the first developed the residential system as one of its distinguishing characteristics, and additional residential accommodation was a serious need even before the latest demands for expansion were made.

A new building for the Department of Physics is an equally urgent need. For many years the Department has conducted its multifarious activities on two separate sites, and the consequent waste of time and energy has for long been almost intolerable. To concentrate the Department in a new building in Whiteknights Park will ease this strain considerably, and will also be an important step towards removing one of the serious obstacles to an increased output of scientists and technologists.

Some time soon, the Library will have to move. Distances may not be great, but there is something rather startling in having a Faculty of Letters in one place and the University Library three-quarters of a mile away. The sudden bright thought of the lecturer, the immediate necessity for checking a reference, and, especially, the fostering of the habit of meditative reading, all demand that the gap in space between the student and the main body of his tools must be bridged as soon as can possibly be.

Other Departments of the Faculty of Science stand high in the queue. The Department of Geology is one, encouraged by handsome benefactions from the oil industry, to assist in the development of studies in sedimentology. Zoology and Microbiology, too, need much more space than is available on the London Road site if they are to make their proper contribution to national needs and to provide the required teaching for the Faculty of Agriculture.

So there will be no peace for the planners for many years yet. The heartening elements in the situation are the liveliness and enterprise of the Departments concerned, the understanding and concern of the University Grants Committee and the sensitive imagination of the architects. How long it will be before the whole of the University is safely housed in Whiteknights Park nobody can possibly know. But the move has begun, and hopes are high.

OBITUARIES

Prof. K. F. Bonhoeffer

The death of Karl Friedrich Bonhoeffer on May 15 at the age of fifty-eight deprived Germany of her foremost physical chemist. He was a member of a distinguished family: his father was professor of psychiatry at Berlin; his brother, who died some years ago, shared with Niemöller the lasting fame which came to those who championed the cause of the Church under Nazi tyranny. He served in the infantry in the First World War and was wounded in 1918. He suffered much also during the Second World War in another way.

Bonhoeffer's academic career began at the Universities of Tübingen and Berlin, where he graduated under Nernst and later became for seven years Haber's assistant at the Kaiser Wilhelm Institute in Dahlem. He successively occupied the chairs of physical chemistry at the Universities of Frankfurt-am-Main (1930), Leipzig (1934) and Berlin (1947), where he was also a director of the Kaiser Wilhelm

Institute for Physical Chemistry. From 1949 onwards he was director of the Max-Planck Physicochemical Institute at Göttingen.

His first researches were in photochemistry, and the "Grundlagen der Photochemie" (1933), which he wrote with Harteck, is one of the best monographs on that subject. The most widely known example of his application of spectroscopy to physicochemical problems is his investigation of the thermal dissociation of water vapour into hydrogen molecules and hydroxyl radicals, the presence of which was detected and the concentration of which was determined spectrometrically. His estimate of 103·3 kcal. per mole as the energy of atomization of hydroxyl remains unchallenged after thirty years. Free radicals have long been recognized as intermediaries in gas reactions. It is one thing, however, to postulate their existence in order to derive a kinetic law or to explain the course of reaction, and quite another to demonstrate the existence and to measure the concentration of a specific free radical. Within recent years many experimentalists have decided to follow Bonhoeffer's example.

Bonhoeffer's most spectacular scientific achievement came in 1929, when he isolated *para*-hydrogen. This proved to be a crucial experiment, to be followed by rapid developments of the quantum theory of chemistry.

Eucken had in 1912 obtained highly anomalous rotational heat capacities for ordinary hydrogen gas, and Mecke in 1924 had recorded a curious alternation of intensities in the spectra of molecular hydrogen. The interpretation of these two apparently disconnected phenomena was given independently in 1927 by Dennison, Heisenberg and Hund, according to whom ordinary hydrogen, hitherto regarded as a pure substance, was in fact a 3 : 1 mixture of *ortho*-hydrogen and *para*-hydrogen, which differed from each other in their nuclear spins and in the rotational energy-levels accessible to them. Physical chemists, while not unimpressed by mathematical arguments based on symmetry properties of wave functions, remained, on the whole, sceptical, and would scarcely have accepted the quantal interpretation were hydrogen gas to remain an inseparable mixture. In 1929, Bonhoeffer and Harteck showed that at low temperatures in the presence of charcoal the conversion of *ortho*-hydrogen to *para*-hydrogen was almost complete. They obtained a sample which was 99·7 per cent pure *para*-hydrogen. Its vapour pressure at the triple point was found to be 2·1 mm. higher than that of ordinary hydrogen and its boiling point 0·13° lower. His pupils, A. and L. Farkas, showed that the ordinarily forbidden interconversion of *ortho*- and *para*-hydrogen could be effected catalytically by paramagnetic molecules or radicals or by atomic exchange, and the reaction $H + p.H_2 = o.H_2 + H$ has proved to be the simplest of known chemical changes, now understood to the last detail.

Bonhoeffer and his school at Frankfurt-am-Main were among the first in the field with experiments on pure deuterium. He was generous with the 9·5-gm. sample of pure heavy water which his department had produced by the spring of 1934. Having schooled his own team to be satisfied with 100 mgm. each, to be recovered after their micro-work, he lavishly sent 1-gm. samples all over the world. It was from him that Rutherford obtained his first sample.

By 1935 it was clear that Bonhoeffer's interests were moving slowly away from physical chemistry to biology; papers appeared on deuterium in growing organisms, on the enzymic hydrolysis of glycosides in heavy water, and on the synthesis of polysaccharides in yeast cells. From 1941 onwards Bonhoeffer's principal experimental work dealt with membrane potentials and with the activation of passive iron as a physicochemical model of nerve excitation.

About half his publications appeared in the *Zeitschrift für physikalische Chemie*, of which he was editor with Bodenstein, Drucker and Simon from 1933 until his resignation in 1941. He was a founder editor of the new series of that journal which was issued in 1954.

Despite his tribulations, K. F. Bonhoeffer preserved an essentially sunny disposition, sustained by a supremely happy home life with his wife, daughter and three sons. He could relax, forget chemistry, enjoy music, and dance well. In his work, he had the enthusiasm of a boy and a gift for inspiring young men. Above all, he was blessed with the humility which is the hall-mark of greatness.

E. A. Moelwyn-Hughes

Dr. Otto Böhm

By the death of Dr. Otto Böhm on May 17, at the age of seventy-two, the Royal Naval Scientific Service has lost a distinguished and devoted servant.

He was born at Zaborze in Upper Silesia on July 2, 1884, and graduated in power engineering at Berlin, proceeding later to his doctorate at Darmstadt with a thesis on the effects of transients in high-voltage power lines. Joining the Telefunken Co., where his interests moved towards electromagnetic theory and radio, he rose rapidly to become director of research in 1922. In these years he made a number of original contributions to research on radio aerials, among them being the 'Tannenbaum' element so frequently used as a component of broadside arrays for high-frequency communications. It was with the Telefunken Co., also, that he did pioneer work on the reflexion of radio waves from obstacles.

But he was a Jew, unobtrusively proud of the accomplishments of his ancient race and inimical to the rising tide of Nazi doctrine. When eventually he stood in peril, the Telefunken Co. gave him due warning and provided an escort to Switzerland.

In 1936 Böhm came to England, and in 1941 to H.M. Signal School (now Admiralty Signal and Radar Establishment). The first experimental 10-cm. radars were then being made in the laboratories for naval use, and there followed an intensely productive period in which he originated one micro-wave aerial after another. At this time his invention of the 'cheese' aerial, to give a fan-shaped beam, was outstandingly apposite to the ship-borne radar problem. This was all pioneer work in a new field of applied science with no well-documented literature to show the way, and within a few weeks of their conception some of these aerials played vital parts in dramatic incidents both at sea and in coastal defence. To this work he brought a rare and remarkable combination of engineering design knowledge allied with an ability to go really deeply into the mathematical theory of aerial design.

His full-time service with the Establishment ended in 1946, but he continued as a consultant until his death, working as hard as ever and visiting the Establishment several times a month. His originality sparkled until the end, and in his last year he put forward a new approach to the problem of supergain arrays which is in the vanguard of thought on this subject.

Otto Böhm was a liberally educated man, versed in the German poets and philosophers, and as ready to talk on the more obscure works of Thomas Mann as he was to exercise his specialized science. Courteous and gentle by nature, and warm in friendship, he would make real personal sacrifices to help any colleague in adversity. As a great teacher, he had an uncanny power for presenting difficult ideas in original and simple ways. It was a pleasure to watch him surrounded by four or five bright young scientists expounding some new idea, and to see him change his approach, or modify his argument, until he was quite sure all had understood. His face would then light up and the years seemed to fall away from him. Those enriched by these experiences, and all who sought him throughout the years, will feel the impact of Hilaire Belloc's lovely lines:

> "He does not die that can bequeath
> Some influence to the land he knows"—

for Otto Böhm loved England, and has bequeathed his influence abundantly. J. CRONEY

NEWS and VIEWS

Extraction Metallurgy at the Imperial College: Prof. F. D. Richardson

THE establishment of a second chair of metallurgy in the University of London emphasizes the growing, if tardy, recognition of the importance of this subject, and it is fitting that a chair of extraction metallurgy should be located in the Royal School of Mines, where this branch of the subject has always received considerable attention. Dr. F. D. Richardson, who has been appointed to this chair, graduated in chemistry at University College, London, in 1933. After completing his postgraduate studies for the Ph.D. degree, he spent two years at the University of Princeton as a Commonwealth Fund fellow. At the outbreak of war in 1939, he was commissioned in the R.N.V.R. and his work on star shells during this period of service won for him an award from the Royal Commission on Awards to Inventors. Dr. Richardson's special interest in metallurgy commenced in 1946 when he was appointed superintendent chemist to the British Iron and Steel Research Association. During the next four years, while building up the Chemistry Department of that Association, he carried out theoretical and experimental investigations into the applications of thermodynamics to iron and steel making, work that has greatly increased our understanding of silicate melts and of the objects of slag control. As the result of these studies, the Sir George Beilby Memorial Award was conferred upon him in 1956, in recognition of his work on the thermodynamic properties of high-temperature systems, with special reference to iron smelting and steelmaking.

On the establishment, through a generous grant from the Nuffield Foundation, of a Nuffield Research Fellowship in extraction metallurgy at the Royal School of Mines, Dr. Richardson was appointed as the first Nuffield Research fellow in 1950. In that capacity, and with valuable additional support from the metallurgical industry, he has been enabled to form the Nuffield Research Group which is engaged in the extension of thermodynamic studies into the field of non-ferrous pyrometallurgy. Now that Dr. Richardson has been appointed to this new chair, it is to be expected that the investigations under his direction will be extended into the hydrometallurgical field that is of such growing importance. The eventual expansion of the metallurgy department, under the expansion scheme at the Imperial College of Science and Technology, should enable the Royal School of Mines to increase the supply of extraction metallurgists familiar with the modern trends in their profession and so enhance its reputation as the premier school in this branch of study.

International Geophysical Year: Awards of the Polar Medal

THE following have been awarded the Polar Medal for good services as members of the advance party of the Royal Society Antarctic Expedition for the International Geophysical Year: *Clasp to the Polar Medal*, Surgeon Lieut.-Comdr. D. G. Dalgliesh, R.N. (Sidcup), leader and medical officer; K. E. C. Powell (West Ewell), senior diesel mechanic; *Polar Medal*, A. R. F. Dalgliesh (Sidcup), general duties; Dr. S. Evans (Stockport), scientist; Sgt. C. F. Le Feuvre, Royal Corps of Signals (Titton, Staffs), wireless operator; D. W. S. Limbert (Finchley), meteorologist; Lieut. G. R. Lush, R.N. (Cosham, Portsmouth), general mechanical engineer; D. R. O. Prior (Norwood), carpenter; J. E. Raymond (West Norwood), senior carpenter; Major G. E. Watson, R.E.M.E. (Bromley, Kent), chief scientist.

The party were south of latitude 60° S. from about December 28, 1955, to February 1, 1957. The efforts of the expedition resulted in a notable acquisition of new knowledge of the meteorological conditions in that region, and, among other subjects, of the aurora australis and the habits of the Emperor Penguin.

University of Reading

Two publications, recently issued, show some aspects of the way the University of Reading is likely to develop. The first describes activities in the Museum of Rural Life during 1956 (Pp. 16. Reading: The University, 1957. 1*s*.) and contains details, not only of the exhibits, but also of three interesting exhibitions which were arranged at the Museum during the year. One of these was concerned with gardening in the eighteenth century, another with Welsh woodware and textiles, and the last with specialized forms of netting, lining and trapping used on the River Severn. The second publication (A History of Whiteknights. By Dr. Ernest Smith. Pp. iii+32 (4 plates). Reading: The University, 1957. 5*s*. 6*d*.) is a fine historical account of the origins and development of Whiteknights Park until its purchase by the University in 1947. With increasing pressure on land in this small island, this imaginative act may well lead to the University of Reading becoming one of the foremost residential universities in Great Britain. Both publications have been designed and produced with exquisite care and taste.

Canadian Journal of Chemical Engineering

In recognition of the growth of the chemical engineering profession in Canada the Chemical Institute of Canada is publishing a new journal, *The Canadian Journal of Chemical Engineering*, the first issue of which appeared in June. In publishing this new journal, the Institute has taken over the *Canadian Journal of Technology*, which was published by the National Research Council. The conversion and renaming of this long-established journal is designed to provide additional service to the chemical engineering members of the Institute, and to provide a medium of publication for the increasing amount of chemical engineering research and development that is being carried out in Canada. *The Canadian Journal of Chemical Engineering*, which will be published every second month, is edited by W. M. Campbell, of the Chemistry and Metallurgy Division, Atomic Energy of Canada, Ltd., Chalk River. Subscription rates are 3 dollars a year; U.K. and U.S.A., 4 dollars; foreign, 4.50 dollars; single copies, 75 c.

Transatlantic Travel

Political and Economic Planning published "Transatlantic Travel" (Broadsheet No. 410. Pp. 85–108. *2s. 6d.*) on May 20, before the Chancellor of the Exchequer announced on June 4 that the ordinary travel allowance, at present £100 a year, would be available in future for travel to the dollar area, in the same manner as for travel in the transferable account area. The Chancellor attempted no estimate of the cost of this relaxation, but the Broadsheet estimates that for an additional dollar cost of £5 million, 40,000–50,000 more people could visit the United States and Canada each year. The Broadsheet, which includes a list of opportunities for study and travel in the United States and Canada, points out that whereas in 1956, 576,000 United States residents visited Europe, of whom 250,000 visited Britain, spending more than 80 million dollars—or 130 million dollars if travel is included—the total annual movement from Britain to the United States in recent years averaged about 37,000, of whom 10,000 were in transit to Australia or the Far East. Of the remainder, 8,500 were business men, about 1,200 had government or official visas, and 1,000 were on 'exchange' visas, mainly university professors or students. The total cost of travel abroad in 1956 was £123 million, of which travel to the dollar area represented £5 million, about one-third being in Canada and two-thirds in the United States. The Broadsheet is critical of other obstacles to travel, such as the visas required by the United States, and the rigorous regulations which must be satisfied before a visit to Canada is allowed. It also concludes that there is a strong case for extending the teacher-exchange scheme to other professions, and recommends establishment of a comprehensive agency with both the United States and Canada to foster such exchanges. Cheaper transport would facilitate a wider extension of university interchange, and much more could be done to encourage transatlantic travel for students.

A New Ferroelectric Material

Progress continues to be made with both methods and materials for the storage of digital information. Recently the Massachusetts Institute of Technology made use of superconductivity in a storage element called a 'cryotron' which occupies little more than 0·01 cm.^{2} per binary digit (bit). Now the Bell Telephone Laboratories, New York, have announced a new ferroelectric material, triglycine sulphate, particularly suited to switching and storage. Its coercive electric field is 220 V./cm., only one-fifth that of either barium titanate, the most widely studied ferroelectric material, or guanidinium aluminium sulphate hexahydrate (G.A.S.H.), a material described earlier by the Bell Telephone Laboratories. The Curie point of the new material is 47° C. (that of barium titanate being about 120° C., and of guanidinium aluminium sulphate hexahydrate not less than 200° C.), but can be raised to 60° C. or more by substituting deuterium for some of the hydrogen atoms. Switching times of a microsecond or two, such as have been realized also with barium titanate, are claimed (guanidinium aluminium sulphate hexahydrate responds much more slowly). Triglycine sulphate does not show the fatigue found in barium titanate after repeated switching, and will retain its polarization for long periods. When a wafer, 1 cm. square and 0·02 cm. thick, has a set of ten parallel strips of metal evaporated on to each of its two large faces, one set at right angles to the other, it can store 100 bits and be driven and read by circuits using transistors. The material is chemically stable, does not decompose on exposure to the air, and can be handled in thin sheets—three valuable secondary properties.

North Pacific Volcanoes

In the past two years studies by American and by Russian geologists have added greatly to our knowledge of the island arc volcanoes of the northern Pacific. In co-operation with the Department of Defense, the United States Geological Survey has lately completed an investigation of the eruptive centres of Alaska, the Aleutian islands, and the Pribilof archipelago ("Investigations of Alaskan Volcanoes", *Bull. U.S. Geol. Surv.*, No. 1028 *A-F*, 1955–56. Pp. 160+21 plates+36 figs.); while simultaneously the results of comparable work on volcanic and hydrothermal activity in Kamchatka and the Kurile Islands has been published in Moscow by the Academy of Sciences (*Trudy Laboratorii Vulkanologii*, No. 10, 82, 1955; No. 12, 218, 1956). In the Pribilof group, described by T. F. W. Barth (*Bull.*, 1028 *F*), the rocks differ from the andesites and basalts of the other volcanic centres in showing alkalic affinities, the basic lavas and tuffs being predominantly basanitic, sometimes with olivine bombs which are presumed to be derived from an exposed periodotite basement. The lengthy studies of Kamchatkan and Kurile volcanoes are replete with petrographical detail and in particular they give much new information on the composition of fumarolic gases. Surprisingly, neither the Russian nor the American authors refer to previous work by their national counterparts.

A Geological Garden

A geological garden constructed at Leeds by Dr. D. E. Owen is described in the issue of the *Museums Journal* for May 1957. A site within the grounds of Kirkstall Abbey was made available, and an outline map of England and Wales was marked by an 18-in. concrete path. Large, typical, clean, unweathered and uncut specimens of rocks measuring 3 ft. × 1 ft. 6 in. were then placed in their correct relative positions. Individual labels giving the name of the rock and its locality, and a larger descriptive label set lectern fashion on an upright post, are provided, and a brief geological history of the country is available at the nearby branch museum.

Evaporation from Grass and Vegetables

PENMAN's method of calculating from past temperature, rainfall and sunshine the amount of water necessary in irrigation to replace that lost by evaporation is based on experimental evidence for evaporation from grass. It has been hitherto assumed, in the application of the method, that the evaporation from other crops is the same as that from grass. N. E. Rider, of the Meteorological Office, working in the School of Agriculture, Cambridge, measuring the evaporation from bare soil, grass, peas and brussels sprouts during the early summer of 1955, found it was on some days much greater from the peas and sprouts than from grass. During the afternoon of June 18 the rate of evaporation from peas was equivalent to a water loss of 7·4 mm. a day, more than ten times the rate of 0·6 mm. a day from grass and the 0·4 mm. a day from soil. The rate from dry, bare soil was less than from grass. Both peas and sprouts formed a continuous cover over the ground. The rate of evaporation was not measured directly but by computation from Thornthwaite and Holzman's aerodynamic formula relating it to differences of wind speed and water content in the vertical direction immediately above the crop. The necessary delicate readings of wind and humidity were made with three types of apparatus, and most of Rider's paper (*Quart. J. Roy. Meteor. Soc.*, 83, 181; 1957) is devoted to justifying the accuracy of the observations. On one afternoon the rate of evaporation was about twice that for which energy could be provided by the intensity of sunshine measured at the nearest station, 60 miles away at Kew, but no error could be found in the instruments. Rider's work is of agricultural importance for deciding how much water to provide in irrigation.

Lethal Effects on Plant Cells of Fungal and Bacterial Extracts

A FURTHER contribution to this theme comes from S. G. Fushtey (*Annals of Botany*, N.S., 21, 273; 1957). When cucumber and turnip tissues were subjected to enzyme preparation of *Botrytis cinerea* and *Bacterium aroideae* in the presence of plasmolysing concentrations of various crystalloids, killing of cells was retarded out of all proportion to the slight retarding effect on maceration. When the tissue cells were recovered from plasmolysis they regained their sensitiveness to the toxic action. Toxicity of mercuric chloride and oxalic acid was also much reduced when cells were plasmolysed. Fractional precipitation with various proportions of acetone and over a wide range of *p*H gave preparations which varied in activity from one treatment to another, but their macerating and toxic actions varied together. After partial maceration, plant tissues were much more sensitive to the toxic action of mercuric chloride or oxalic acid. This is interpreted as meaning that, before maceration is complete, the toxic principle has been able to reach the protoplastic surface and to exert a deleterious effect upon it. The evidence presented gives further support to the view that the enzyme system of the two pathogenic organisms which macerates the host cell walls also brings about death of the protoplasts.

Brown Library, Liverpool

To mark the unveiling by H.M. Queen Elizabeth the Queen Mother on June 25 of a plaque commemorating the commencement of the rebuilding of the Brown Library as part of the celebrations of its centenary and of the 750th anniversary of the creation of Liverpool as a borough, the City Librarian, Dr. G. Chandler, has compiled an illustrated booklet (Centenary of the Brown Library and its Satellites, 1857–1957. Pp. 24. Liverpool: Central Public Libraries, 1957) recording the development of the several central libraries of Liverpool, all named after benefactors, and other principal donations to the Liverpool City Libraries. Besides the Brown Library itself, opened in 1860 and named after Sir William Brown, there are the Picton Reference Library, opened in 1879 and named after Sir James A. Picton, and the Hornby Library, presented by Mr. H. F. Hornby and opened in 1906. The Oak Library, opened in 1914, was built to house some of the most valuable books given to the city or acquired by special purchase, and the Commercial Library, opened in 1917, was considerably expanded in 1955. Rebuilding of the Brown Library will cost more than £400,000, and the area devoted to the temporary Technical Library (opened in 1952) will be used for the Record Office and local history collections when the Hunter Street block is built. The new modern building is expected to contain the permanent technical and patents libraries; the general reading room to replace the Christian Street library; a Central junior library with meeting and exhibition rooms; a lecture theatre to seat 850, which could also be used for public meetings; a large exhibition hall; staff and stock rooms; and accommodation for the Parents–Teachers–Youth collections temporarily housed in Blue Coat Chambers. The anniversary is also marked by an exhibition of books, manuscripts, water-colours and prints in the International Library, Central Public Libraries, during June 17 to September 28.

International Scientific Radio Union

THE twelfth General Assembly of the International Scientific Radio Union (U.R.S.I.) will be held at Boulder, Colorado, during August 22–September 5, by invitation of the U.S. National Committee of the Union and the U.S. National Academy of Sciences. Accounts of the previous meeting at The Hague in 1954 and of reports of its proceedings were given in *Nature* for September 3, 1955, p. 451, April 7, p. 652, and September 8, 1956, p. 528. Plans for the forthcoming meeting at Boulder have already been announced by the United States organizing committee under the chairmanship of Dr. J. H. Dellinger, honorary president of the International Scientific Radio Union. These include preliminary agenda for meetings of the seven commissions dealing, respectively, with radio measurements and standards, tropospheric and ionospheric propagation, noise of terrestrial origin, radio astronomy, and waves, circuits and electronics. The president of the International Scientific Radio Union for the General Assembly is Father P. Lejay (France). The Union is composed of national committees which contribute by subscription to its income and, as a result, are entitled to official representation and participation in its scientific work before and during each General Assembly. The British National Committee for Scientific Radio is organized under the auspices of the Royal Society, with Mr. J. A. Ratcliffe as chairman. This committee has nominated a British delegation comprising scientists directly interested in one or more of the subjects of the commissions described above. This is the second meeting of the Union to be held in the United States, the 1927 General Assembly having been in Washington. The Boulder meeting will be of special interest in connexion with the programme of the International Geophysical Year, which starts on July 1.

Oversea Service Division, Colonial Office

THE following appointments have recently been made in the Oversea Service Division, Colonial Office: S. H. Abbott (superintendent of agriculture, Antigua, Leeward Islands), superintendent of agriculture, St. Kitts–Nevis–Anguilla, Leeward Islands; B. Butters (agricultural chemist, Uganda), soil fertility chemist, Uganda; K. S. Feltham (government chemist, Northern Region, Nigeria), federal government chemist, Federation of Nigeria; A. Rogerson (scientific officer, East African Veterinary Research Organization), senior scientific officer, East African Veterinary Research Organization; W. E. M. Logan (deputy chief conservator of forests, Tanganyika), deputy chief conservator of forests, Uganda; J. W. Barnes (geologist, Uganda), principal geologist, Uganda; E. F. Bradford (geologist, Federation of Malaya), principal geologist, Federation of Malaya; J. M. B. Harley (scientific officer, East African High Commission), senior scientific officer, East African High Commission; P. W. M. Allin (deputy director of surveys and lands, Northern Rhodesia), surveyor-general, Surveys Department, Northern Rhodesia; W. Gascoyne (senior surveyor, Western Region, Nigeria), deputy director of surveys, Western Region, Nigeria; W. M. Younger (chief surveyor, Department of Surveys and Lands, Northern Rhodesia), commissioner of lands, Lands Department, Northern Rhodesia; R. W. Butler (veterinary officer, Tanganyika), veterinary research officer, Tanganyika; A. Orhan (veterinary officer, class I, Cyprus), chief veterinary officer, Cyprus; A. A. Brunt, plant pathologist, virologist, West African Cocoa Research Institute, Ghana; J. P. Parmiter, agricultural officer, Zanzibar; T. W. Tinsley, deputy director, West African Cacao Research Institute, Ibadan, Federation of Nigeria; R. D. H. Rowe, assistant conservator of forests, Kenya; A. T. Carr, geologist, Uganda; J. A. Cole, geologist (geophysicist), Federation of Nigeria; A. R. Drysdall, geologist, Northern Rhodesia; P. Ibbotson, geologist, Fiji; W. J. Jones-Davies, veterinary officer, Northern Nigeria; Dr. V. Balashor, physicist/chemist, Northern Rhodesia; A. E. Cookbain, palaeontologist, Cyprus.

University News: London

UNIVERSITY chairs of applied mechanics, mining geology and technical optics have been instituted at the Imperial College of Science and Technology from October 1, 1957, to replace existing professorships in these subjects. The present holders of the professorships have been appointed to the newly instituted chairs as follows: Prof. H. Ford (applied mechanics); Prof. D. Williams (mining geology); Prof. W. D. Wright (technical optics).

Sheffield

THE following appointments in the University of Sheffield have been made: G. R. Hervey, as lecturer in physiology; Dr. B. B. Argent, as lecturer in metallurgy; D. Parsons, as assistant lecturer in physics; B. Truelove, as junior research fellow in botany; D. Bryce, as junior research fellow in zoology.

The University has accepted an offer by Messrs. Edgar Allen and Co., Ltd., to establish a postgraduate scholarship for study or research to be known as the Charles Kingston Everitt Memorial Scholarship, and an offer by Messrs. John Thompson, Ltd., of Wolverhampton, to establish a research scholarship in the Department of Mechanical Engineering to be known as the John Thompson Research Scholarship in Mechanical Engineering. The University has also accepted a generous donation of £4,000 from Messrs. Metropolitan-Vickers Electrical Co., Ltd. The donation will be used to provide equipment for the Department of Mechanical Engineering.

Announcements

MR. ELWYN JONES has been appointed to fill a vacancy in the membership of the Agricultural Research Council. Mr. Jones is a prominent Welsh farmer and a well-known breeder of Hereford cattle. He is keenly interested in all scientific developments in farming and has travelled extensively, particularly in North America, studying farming methods.

THE following officers of the Salters' Company have been elected for the year 1957–58: *Master*, Lieut.-Col. B. B. N. Woodd; *Upper Warden*, Sir Charles Goodeve; *Second Warden*, E. C. S. Price.

THE following have been elected officers of the Royal Meteorological Society for 1957–58: *President*, Prof. P. A. Sheppard; *Vice-Presidents*, Dr. A. W. Brewer, Dr. C. H. B. Priestley, Dr. R. C. Sutcliffe and R. G. Veryard; *Vice-President for Canada*, R. C. Graham; *Vice-President for Scotland*, J. R. Atkinson; *Treasurer*, Dr. J. S. Farquharson; *Secretaries*, P. J. Meade, Dr. H. L. Penman, Dr. G. D. Robinson (editor) and Dr. A. G. Forsdyke (librarian).

Immunology, the official journal of the newly formed British Society for Immunology, will be published by Blackwell Scientific Publications, Ltd. Contributions to the first issue, which will appear in January 1958, should be received by the editor, Prof. J. R. Marrack, Department of Pathology, Cambridge, by the end of July.

A COURSE in photoelasticity extending over the academic year 1957–58, and comprising weekly lectures on the theory and methods of photoelasticity, with particular emphasis upon the use of photoelastic methods in practical stress-analysis problems, is to be held in the Department of Civil and Municipal Engineering, University College, London, starting in September. Applications to attend and for further details should be made to the Secretary, University College, Gower Street, London, W.C.1.

IN the article in *Nature* of May 4, p. 900, par. 2, line 19, it is stated: "Records at Table Mountain also showed the increased atmospheric opacity arising from the Alaskan volcano in 1953 and from the explosions of nuclear or thermonuclear bombs". This is incorrect. The Report (p. 67) states: "Records from Table Mountain show clearly the increased opacity of the atmosphere arising from the Alaskan volcano in 1953. However, they show no effect of increased opacity arising from the explosions of nuclear or thermal nuclear bombs".

VAPOUR DETECTORS FOR GAS CHROMATOGRAPHY

An informal symposium on "Vapour Detectors for Gas Chromatography" was held in the Physical Chemistry Laboratory, Oxford, on May 3. The meeting was organized by the newly formed Gas Chromatography Discussion Group associated with the Institute of Petroleum, and was the first of a series of such meetings to be held twice yearly at centres throughout the country. More than two hundred participants attended and six papers were presented, the chairman and local organizer being Mr. C. S. G. Phillips.

In an introductory paper, Dr. A. I. M. Keulemans emphasized the importance of the detector in gas chromatography and the necessity for a continual improvement in its sensitivity. He directed attention to the recommendations made at the symposium in London during May 1956[1], concerning the description of detector characteristics, and suggested that the method described by Dimbat, Porter and Stross[2] for comparing sensitivities was generally applicable. This expresses the sensitivity, S (in units of mV. ml./mgm.), in terms of the peak area obtained for a given weight of a component, but is only suitable for use with a chromatographic assembly of column and detector. A statement of the noise level, s (in microvolts), is also required. The sensitivity of the detector alone is better defined as the minimum detectable vapour concentration (γ/ml. carrier gas), for a specific signal to noise ratio. Another speaker later commented that high sensitivity without a reasonably small detector volume and short time of response is not particularly useful for chromatographic purposes. Dr. Keulemans continued with a brief consideration of the relative merits of the thermal conductivity and β-ray ionization detectors. Although sensitive katharometers are comparatively easy and cheap to construct (S = 300–1,000, s = 0–20) they suffer from two defects, namely, non-linearity of response, which necessitates calibration; and decomposition of vapours at high temperatures. These defects are largely overcome with the ionization detector, which can achieve a similar sensitivity and is much less sensitive to temperature changes. Expensive amplifying equipment is required, however.

The next two papers dealt with ionization detectors employing radioactive sources. Dr. H. Boer discussed the stability of the single-cell β-ray detector developed in the United States[3] compared with that of the balanced twin-cell arrangement he had already described (ref. 1, p. 169). To achieve a satisfactory zero drift, it is necessary to control the temperature of the former to within one-tenth per cent of the absolute temperature, but the latter is very much less sensitive. He had found it completely satisfactory to heat the twin-cell with infra-red lamps in a simple oven without a thermostat. Optimum cell depths, of the order of 15 mm., are only a fraction of the free path length of the β-particles in air, and tend to decrease with increasing source strength and become larger as the polarizing voltage is increased. The detector gives a good quantitative response with low vapour concentrations; corrections due to ionization cross-section are usually not very important. Dr. Boer finally described a modified twin cell detector requiring only a simple double triode amplifier, which was being tried at temperatures greater than 250° C.

In the second paper, Dr. J. E. Lovelock described another balanced twin-cell arrangement, but with the radioactive sources in the form of foil and with guard-rings on the ion collectors. He claimed, however, that the use of argon as carrier gas allowed a gain in sensitivity over the cross-section detector of at least one hundred to be achieved. This is possible because of the unique ionization properties of this gas. In common with the other rare gases, argon produces, on irradiation, many more excited atoms than ions, but the energy of these excited argon atoms is comparatively low (about 11·5 eV.). Additional ionization of vapour molecules by collision with these atoms occurs, but their energy is insufficient to affect any of the contaminants found in commercial argon. Although a 10-millicurie strontium-90 source was normally employed, the higher sensitivity made possible the use of an 80-microcurie radium source. With a polarizing voltage of about 700 V. the response had been shown to be linear at low vapour concentrations and a close function of the mole fraction for most common organic structures. The current produced by the detector is of the order of 5 × 10^{-8} amp., and this is recorded with the assistance of a simple electrometer amplifier. Dr. Lovelock commented that the detector had been successfully operated from 20° to 200° C., and that no zero drift took place when raising the column temperature through this range during the course of an analysis. Normal column loadings were in the range 0·1–1 mgm. when the minimum detectable amount at a signal to noise ratio of 2 : 1 was 5 × 10^{-7} moles.

The afternoon session opened with a paper by Mr. J. C. Hawkes on the use of the gas density balance at high temperatures. An earlier apparatus described by the author (ref. 1, p. 266) had operated successfully up to 300° C. using a vapour jacket. In considering a design to operate from 200° C. to as high as 550° C., difficulties with gaskets and the lack of thermally stable boiler liquids had necessitated the adoption of electrical heating for both the block and columns. The construction of the latest model was nearly complete and the uniformity of the temperature along the column had been kept within 2° C. even at an operating temperature of 500° C. Platinum resistance thermometers are employed as temperature controllers operating in an a.c. bridge circuit through phase-sensitive amplifiers to control the electrical input. In this way thermostatting to ± 0·3 per cent of the operating temperature is achieved. Many difficulties had been encountered in devising modes of construction to withstand the large temperature changes, particularly with the anemometer heater and thermocouple supports. The most satisfactory heater arrangement achieved had a hollow invar shaft surrounding a twin-hole porcelain tube through which stainless steel lead-wires passed. These were sealed to the ceramic with soda glass. To prevent corrosion the inside of the balance had been coated with nickel by a non-electrolytic method[4]. An interesting sample introduction system employing a glass-phial crusher was described for use with the equipment.

The next speaker, Mr. J. R. Bishop, discussed the use of directly heated bead thermistors in thermal conductivity detectors. He presented data on the sensitivity of five different types of elements of both British and American manufacture. Using nitrogen as carrier gas, S values of 100–600 had been obtained with noise level lower than 10 microvolts. All types examined are stable up to 150–160° C. in nitrogen but with hydrogen as carrier gas the upper limit is only 100° C. at low bridge currents. With a bridge current of 15 milliamp. in hydrogen, noise appears, especially with uncoated beads, and at higher currents irreversible changes take place. A simple arrangement with a single thermistor supported in an extension 8 mm. in diameter at the end of a glass chromatographic column is effective and has a low detector volume. It is inherently sensitive to flow and this is best compensated by using another thermistor in the bridge, placed at the end of a second column. With the two elements connected in parallel to the applied voltage it was shown that the sensitivity was highest when the two fixed bridge resistors had values lower than the operating resistance of the thermistors. A detector with four thermistors connected in a bridge, which should give even higher sensitivity, was being constructed. Mr. Bishop directed attention to new American thermistors capable of operation up to 300° C., and illustrated the robustness of modern elements by describing how a colleague regularly cleans his detector with strong sulphuric acid. In conclusion, he commented on the possible use of thermistors for vapour detection based on specific heat rather than thermal conductivity differences.

One of the most recent detectors described, the low-pressure electric discharge, formed the subject of the last paper, by Dr. R. C. Pitkethly. Preliminary experiments with simple discharge tubes similar in construction to that used by Harley and Pretorius[5] demonstrated the very high sensitivity of the voltage drop across the discharge to small changes in concentration of hydrocarbon vapours in a stream of nitrogen passing through it. Early tubes, with platinum electrodes spaced a few centimetres apart, were very noisy and showed a poor linearity of response, with tailing of the peaks. These effects were attributed to electrode sputtering, changes in the number of bands in the positive column, poor scavenging and pronounced pressure sensitivity. An improved detector tube, employing a modified small neon indicator bulb, had been developed. This had comparatively large closely spaced iron electrodes, and was run at a pressure of about 3 mm. mercury with 200–300 V. across it. A pair of these tubes were connected to the ends of two columns with fine capillary tube, which provided the necessary pressure drop. They were operated in a simple bridge circuit with a double triode impedance changer to enable a standard high-speed potentiometric recorder to be employed. With this arrangement operated at room temperature, it is easily possible to detect a concentration of paraffin hydrocarbon gases in nitrogen of one part in ten million by volume. In the range C_1–C_4, the response to paraffins eluted in nitrogen from a column ranged from 9 to 38 volt–litres per micromole, rising with molecular weight. This sensitivity in the units proposed earlier is of the order of 3 × 10^6 mV. ml./mgm. with a noise level of ·20 mV.

Before closing the meeting, the chairman invited Mr. R. P. W. Scott to describe his recent work with the hydrogen flame detector. A miniature bunsen burner-like attachment had been fixed to the top of the jet, which produced a pre-mixed flame more compact and stable than the original diffusion type. This, in conjunction with a platinum–rhodium/platinum thermocouple 0·004 in. in diameter on an improved support, had produced a marked increase in sensitivity. The minimum detectable concentration was now about 0·07 γ/ml. with a signal to noise ratio of four.

TRACE ELEMENTS IN SOILS, PLANTS AND ANIMALS

More than one hundred people listened with interest to papers and discussion at a symposium on trace elements in soils, plants and animals which was held in Bristol during April 10–12. Seven papers out of seventeen were contributed by workers at Long Ashton. C. Bould spoke on iron chelates for control of chlorosis in plants. With fruit trees, good results were obtained by applying chelates to the soil, provided that they were well watered in so that they reached the rooting zone before their iron was liberated by interaction with calcium. For strawberries or blackcurrants seasonal cure of chlorosis could be obtained by foliar sprays: a good wetting agent was essential. If chelates are absorbed in excess by plants there is a risk that minor elements may be affected. E. J. Hewitt reported that, with cauliflower, molybdenum is required not only for reduction of nitrate; when toxic accumulation of nitrate is avoided, by supplying nitrogen in other forms, deficiency of molybdenum has disturbing effects involving limited growth, reproductive failure and low concentration of ascorbic acid and, in cauliflower, symptoms of whiptail. In discussion it was mentioned that soil acidity, which is normally accompanied by lack of calcium, may cause plant injuries due to deficiency of molybdenum or excess of manganese and aluminium. D. J. D. Nicholas reported that in *Neurospora* and in green plants the step-wise reduction of nitrate to nitrite, to hyponitrite, to hydroxylamine, to ammonia was effected by flavin enzymes dependent on molybdenum, on copper and iron, on copper and iron, and on manganese, respectively. An alternative to the final step is the non-enzymic reaction of hydroxylamine with ketonic acids, resulting in the formation of oximes which are then reduced enzymically to amino-acids. That molybdenum is a constituent of nitrate reductase has been shown, because activity of the enzyme was diminished after dialysis in the presence of cyanide but was largely restored by adding molybdenum to the apoenzyme, whereas addition of various other elements was without effect. Strains of *Azotobacter* and *Clostridium* require molybdenum and iron for nitrogen fixation; in some instances vanadium or tungsten can replace molybdenum in this process. The hydrogenase enzyme, which is primarily iron-dependent, is not invariably coupled with nitrogen fixation. Speaking of tropical agriculture, R. A. Webb noted that preoccupation with the major plant nutrients, nitrogen, phosphorus and potassium, had led to neglect of other nutrients which are now known to be essential for satisfactory growth of plants. He had obtained decisive indications of several elementary deficiencies with pot experiments in the Gambia by using subtractive techniques developed at Long Ashton. Similar results were now being obtained in other tropical areas. Successful fertilizer practice might require the use of mixtures supplying four or more essential nutrients. In discussion the need was stressed for sound agronomic practices and for numerous and widely scattered field experiments.

A. H. Williams described an investigation of certain organic compounds in plants and their variation with nutritional status; it was hoped that in plants suffering from nutrient deficiencies accumulation might occur of metabolic intermediates not readily detected in normal plants. Using paper chromatography, he found unusually large amounts of arginine in cauliflowers grown at low molybdenum-levels and supplied with nitrogen sources other than nitrate; when nitrate was supplied a low content of glutamic acid accompanied molybdenum deficiency. With tomato there is evidence that several linked metabolic processes are dislocated by deficiency of potassium or calcium or magnesium; this was associated with high levels of asparagine and glutamine and marked changes in the contents of malic and nitric acids and sugars. In discussion, the bearing of these studies on animal nutrition was mentioned. H. M. Stevens described the use of paper chromatography in the separation of valency states of biologically important metals: the method was applied to the preparation of pure cation solutions in known valency states which were used to determine valency changes in metals during enzymic action. C. F. Timberlake had found small quantities of copper, zinc, iron and lead in the tissues of fruit and still less in fruit juice. Copper occurs in polyphenol oxidase, but also occurs in ionic association with malic acid and in more stable complexes with amino-acids and with many phenolic compounds. At acid pH values normally found in fruits, only a small proportion of copper may be complexed with phenolic compounds: it acts as catalyst during their oxidation. In discussion it was noted that organic acids give copper complexes that differ widely in their stability and presumably in their nutritive value.

M. Fieldes and N. Wells reported that in New Zealand the composition of sweet vernal grass grown on 250 soil-types is being studied in a comprehensive scheme of analysis. Uptake of molybdenum by sweet vernal grass is related to molybdenum content of the topsoils and to the nature of the clay minerals, consisting in New Zealand mainly of hydrous oxides or allophane formed by weathering of primary minerals. Allophane contains aluminium in 4-co-ordination; molybdate and other anions containing oxygen are strongly held at broken bond sites in the clay and are less readily released to the plant. Molybdenum uptake thus decreases as weathering proceeds: it depends on pH also in a rather complicated way. In discussion, attention was directed to the large seasonal and other changes in composition of grass that make this kind of study difficult. This subject was treated by R. L. Mitchell, J. W. S. Reith and Isabel M. Johnston in a contribution from the Macaulay Institute. In Scottish soils the most important factor influencing trace-element availability is the drainage status. Under poor drainage conditions the extractable contents of many trace elements in soils are increased and in certain instances, notably cobalt and nickel, there is a corresponding increase in plant uptake. Numerous and detailed analyses of plants had shown such large changes in mineral content at different times of sampling that it now seemed that analysis of soil would prove a better guide to long-term plant content, provided suitable extractants could be found. For this purpose, ethylenediamine tetra-acetic acid (EDTA) may be more useful than acetic acid. A lively discussion ensued regarding the composition and analysis of pasture, which depends not only on soil but also on the proportion of grass to clover. It was mentioned that when pasture is deficient in cobalt the ruminant derives little or no benefit from soil ingested with the fodder.

Having in mind the Long Ashton work on factors involved under the general heading of soil acidity, E. G. Hallsworth, E. A. N. Greenwood and Jane Auden had grown clover, lucerne and lupin in sand and water cultures to study their reactions to low calcium- and high manganese- and aluminium-levels and had found serious restriction to growth in plants showing no toxicity symptoms. In experiments with subterranean clover, growth was restricted when copper was supplied at a low level, but the injury was not otherwise conspicuous; by increasing the copper supply a three-fold increase in dry matter production was obtained. With low levels of copper, phosphorus and molybdenum the plants were perfect miniatures. This effect was not confirmed in a later experiment: the discrepancy is ascribed to climatic conditions, in that symptoms of toxicity or deficiency are most evident when plants are growing vigorously.

A. Thompson's paper on the trace-element contents of herbage plants was presented by Mr. Brynmor Thomas. Supplementing earlier reports, analytical data were given for eight grasses, four legumes and four herbs from Cockle Park; hand-picked specimens of eight herbage plants from plots treated with fertilizers and manures for fifty years showed no large differences in their content of copper or cobalt. Samples from the Palace Leys hay plots showed differences in trace-element content that are ascribed mainly to differences in botanical composition. It cannot be assumed that minerals in fodder are wholly or uniformly available to the animal; for anaemic rats grasses are a better source of iron than legumes or herbs, but all three are inferior to ferric chloride. Aluminium exceeding 200 p.p.m. of the dry matter indicates contamination with soil. There was some discussion on differences in manganese between A. Thompson's analyses and those of R. L. Mitchell. It was noted by E. A. N. Greenwood that variation in manganese content of lucerne at Sutton Bonington had been traced to variation in illumination.

H. A. Robertson and A. W. J. Broome recorded that injection of thyroxine (four sheep) was followed by a rise in the level of blood sugar and rapid respiration with a slow return to normal, while dosing with thiouracil (two sheep) produced a notable fall in the level of blood sugar and apparently a less slow recovery. There was an inverse change in blood cholesterol. No change was observed in one sheep receiving gradually increasing injections of DNOC. It is inferred that blood-levels of copper depend on activity of the thyroid gland, which affects the basal metabolic activity. In discussion it was noted that both thyroxine and thiouracil form complexes with copper.

C. F. Mills's paper on dietary factors influencing copper utilization by the animal was presented by Dr. D. P. Cuthbertson. The greater part of the copper in herbage is in the form of fairly stable organic complexes. Copper in herbage, and in aqueous extracts made from herbage, is more readily available to rats than an equivalent amount of cupric sulphate: the copper complexes present in the extract are not decomposed at ranges of acidity such as occur in the gastric contents of the rat; nor are they decomposed in the digestive tract of the sheep but seem to be absorbed intact. The lower availability of ionic copper may be ascribed to the formation of insoluble compounds. Discussion followed regarding conflicting findings with swayback in sheep. It was noted that in animals excess zinc reduces the activity of cytochrome-*c* oxidase, whereas copper restores it; in micro-organisms molybdenum has a similar effect to zinc, and the molybdenum–copper interrelationship therefore seemed worth studying in animal enzyme systems.

Copper nutrition in ruminants was further discussed in a paper by Ruth Allcroft and Gwyneth Lewis, who observed that copper deficiency in cattle and sheep in the United Kingdom occurs on pastures with an apparently normal or even high copper content. This is in contrast to parts of Australia and New Zealand, where the disorder is regarded as a simple copper deficiency associated with a low copper content of pastures—usually less than 5 p.p.m. Observations in the United Kingdom indicate the presence of other factors in the herbage which interfere with the utilization and storage of copper in the animal. Australian work has shown that a high molybdenum intake can limit liver copper storage in sheep and cattle, and that the inorganic sulphate content of the diet influences the effect of molybdenum. Evidence obtained so far indicates that the copper, molybdenum and inorganic sulphate contents of the food are not the only factors concerned in the occurrence of copper deficiency in ruminants in Britain. Some of the complexities of copper metabolism were discussed and the possible danger of over-supplementation with copperized mineral mixtures was pointed out. E. J. Butler commented on the gross disparity of pathological symptoms associated with copper deficiency; he agreed that low copper content in pasture does not always lead to swayback. H. A. Robertson mentioned a flock of sheep which was healthy in spite of low levels of blood copper. J. W. S. Reith said there were areas in north-eastern Scotland where crops had responded to application of copper, but animals showed no deficiency in spite of the low level of copper in the pasture.

Classical examples of cobalt deficiency occurring in Connemara were reported by L. B. O'Moore. The disorder occurs with cattle grazing on a calcareous sand of the coastal area and with sheep, especially with recently weaned lambs, pastured on certain acid peats in the inland hill area. On the same peats, cattle are liable to suffer aphosphorosis. The traditional way of avoiding these troubles is to move stock to different grazing areas. However, fortnightly drenching with cobalt sulphate is effective in the coastal sand-blown pastures; top dressing with cobalt is advocated for acid peat land.

A. D. Osborne has found a moderate degree of cobalt deficiency in some parts of north Herefordshire. No severe symptoms appear, but male lambs gain weight more rapidly when given a fortnightly drench of cobalt sulphate; female lambs benefit less from the treatment. In discussion, J. B. E. Patterson noted that the subclinical deficiency is of financial importance to the farmer. The investigation has been difficult, since analytical data for soil and for pasture do not give a clear picture: limits found acceptable elsewhere are not satisfactory here.

Confirming observations in the United States, D. B. Bellis and J. McL. Philp, by adding zinc to the dry feed of 8–16-week-old pigs, obtained spectacular cures of parakeratosis, a severe disorder of the skin accompanied by reduced growth. In discussion, it was asserted that the syndrome is mainly due to excessive amounts of calcium carbonate incorporated in proprietary pig feeds; the diet quoted by the authors is high in calcium and low in phosphorus. Work is being continued with a range of calcium/phosphorus ratios.

On April 12, symposium members visited the Long Ashton Research Station and the University of Bristol Veterinary Laboratory at Langford and the artificial insemination unit of Horlicks Farms and Dairies, Ltd. The symposium was organized jointly by the Agriculture Group and the Bristol Section of the Society of Chemical Industry. The organizers owed a particular debt to Prof. T. Wallace and his colleagues for the success of the meeting. The papers and discussions of the symposium will appear in a supplementary issue of the *Journal of the Science of Food and Agriculture* later this summer.

SEMICONDUCTORS

THE subject of the Spring (1956) Meeting of the Physical Society, organized with the assistance of British Thomson-Houston, Ltd., was "Semiconductors". The report* of the meeting has now, a little belatedly, been published; it contains all but one of the twenty-three papers read, but not the discussions.

Prof. N. F. Mott opened the meeting with his ideas on the transition to metallic conduction via impurity states in a semiconductor. He sought to show that in an array of monovalent atoms, the overlapping of the wave functions of adjacent atoms, though making electron transfer possible, does not necessarily lead to freely mobile carriers. He contested the assumption that an array of singly charged centres in a semiconductor, containing only donors or only acceptors, can be treated as a half-filled band. Confirmation of his prediction, that transition to metallic conduction with increase of concentration of monovalent dissolved atoms will be sudden, may have to await a sample of a semiconductor with regularly spaced donors or acceptors.

Another speaker introduced the idea of a 'semiconductor bond'. It does not exclude one (A) of the two atoms of a compound AB having incomplete s- and p-orbitals, provided there is no bonding together of the A atoms. Some predictions of new semiconducting compounds were made, based on a simple relation between the number of valence electrons per molecule, the number of atoms of the molecule lying in Groups IV–VII and any bonding between these atoms.

* Report of the Meeting on Semiconductors held by the Physical Society, in collaboration with British Thomson-Houston, Ltd., Rugby, in April 1956. Pp. 153. (London: Physical Society, 1957.) 20s (12s. 6d. to members).

Almost all the other papers dealt with practice—technology and measurements—or with the properties of junctions. In the main they consolidated or clarified earlier work, or directed more detailed attention to outstanding problems; some contained comprehensive measurements. Only a few of the many points made can be reviewed here.

Improved trace-analysis has been needed to assist the purification of silicon. The common donor elements can now be estimated to 1 part in 10^{9} by methods using radioactivation; equally sensitive methods are still lacking, however, for two acceptor elements, boron and aluminium. The rates of evaporation of donor and acceptor elements from molten silicon have been measured; when proper attention is paid to them, as well as to segregation constants, control of resistivity of single crystals grown from the melt is much improved. Carrier life-time in silicon is markedly dependent on injection-level; values for very low levels, obtained in part by extrapolation, have enabled a study of dependence on temperature to be commenced.

It has been suggested that most of the carriers responsible for the reverse current of a *p-n* junction in silicon are generated, not in the *n*- or *p*-regions, but in the depletion layer. New measurements, showing the current to have an activation energy of only 0·7 eV., point to the current arising in a surface channel. An analysis of a model of a *p-n* rectifier, intermediate between the one-junction (*p-n*-ohmic) and two-junction (*p-n-n*+) models, was presented; it, too, predicted a two-component forward current-voltage relationship, $I \propto \exp(qV/kT)$ at small voltages and $I \propto \exp(qV/2KT)$ at large voltages.

The non-ohmic conductivity of *n*-type germanium has been measured for fields less than, as well as greater than, 10^{3} V./cm. For fields between 10^{4} and 6×10^{4} V./cm. it is so pronounced that the electron drift-velocity changes very little; thereafter avalanche multiplication sets in. Many of the properties of small-area diodes can be explained by these phenomena alone.

There were contributions on noise—an endeavour to detect shot-noise—surface conduction and the Ettingshausen effect, all in germanium.

Compound semiconductors also received attention. Extensive measurements were reported for indium antimonide and indium arsenide—for both of which some degeneracy remained at all temperatures even in the purest samples—and for gallium arsenide of improved purity, many donors having been removed by zone-refining. Measurements of photo-effects in indium antimonide were used to deduce carrier mobilities, μ_e and μ_h, and life-time. There was marked dependence of μ_e on hole-concentration in *p* material; life-times were short, less than 0·1 microsec., at room temperature. The spectrum of recombination radiation from indium antimonide has now been measured; because the absorption spectrum of thin specimens enables a value of radiation life-time of about 0·8 microsec. to be deduced, which is little more than some experimental values of carrier life-time, it was concluded that recombination in indium antimonide may be mainly radiative.

The electron contribution to the thermal conductivity, at room temperature, of an impure sample of indium antimonide (Hall constant 2×10^{-4} cm.^{3}/coulomb) was calculated to account for the observed increase above the value for a purer sample (5×10^{-3} cm.^{3}/coulomb). However, whereas the electronic contribution in extrinsic bismuth telluride conformed with existing theory, the contribution in intrinsic material was more than expected, probably due to the transfer of ionization energy down a thermal gradient.

The nuclear resonance of indium-115 in highly degenerate *n*-type indium antimonide was shown not to differ in frequency from that in intrinsic material (that is, the Knight shift was absent); an adequate explanation lies in the very small effective mass of conduction-electrons in indium antimonide. The size and shape of the resonance are sensitive to cold working of the crystals and to the addition of tellurium as a donor.

The many informal discussions, possible because the audience was in residence, continually stressed the need for more frequent, similar, meetings. The subject has entered so many fields of science and technology, and so quickly finds new applications of effects, that the workers in the field, many of them young, have difficulty in keeping themselves adequately informed. J. R. TILLMAN

THE WHISTLED LANGUAGE OF LA GOMERA

LA GOMERA is one of the Canary Islands, lying in the Atlantic off the west coast of North Africa. It is inhabited by some 30,000 Spanish-speaking people, scattered over the island in many tiny hamlets and four little towns. The island, volcanic in origin, is distinguished by a rugged and peculiar topography. It has the general shape of a big tent; from a central peak some 4,500 ft. high it slopes down on all sides to sheer cliffs at the sea's edge. Deep gorges radiating from the centre cut up the terrain. It is a difficult, mountainous country where two points only 500 yards apart as the crow flies may be as much as an hour apart in walking time. Apart from a single road, which links San Sebastian, the capital, with the other three towns, the only means of travel between most points on the island is by rough paths which are little better than goat tracks; communication on the island is a great problem.

But the Gomeros do communicate freely, across their ravines and from the valleys to the mountain-tops. The method of communication has been described in an article by André Classe (*Sci. Amer.*, 196, No. 5; May 1957). Long ago the Gomeros contrived an elegant solution to their problem: namely, a whistled language by which they speak to each other across miles of disjoined terrain. The *silbo*, as this language is called, is not a mere code or signal system but a version of Spanish. It has extraordinary carrying power: it can be heard and understood clearly over far greater distances than shouted talk. On a windless day any practised *silbador* can be heard more than a mile away. A good performer can whistle messages three miles or more.

On La Gomera, goatherds on widely separated hills carry on *silbo* conversations merely to pass the time. They whistle long sentences and even make jokes. During the Spanish Civil War in 1936–39 Gomeros were used occasionally for communication at the front; but the practice was discontinued when it was discovered that there were *silbadores* on both sides, so that the degree of secrecy was not high.

This curious medium of communication owes its existence to the geography of La Gomera. It goes back to the aborigines who inhabited it before the Spanish arrived in the fifteenth century. The aboriginal residents in the Canary Islands, called the Guanches, had developed a whistled form of their language for communication in their territory, then so thickly wooded that whistles were the only kind of 'talk' which could be transmitted for any distance.

The *silbo* is based directly on the Spanish language and is learned effortlessly and as a matter of course by most Gomeros. Children on La Gomera pick up *silbo* as naturally as they pick up spoken Spanish in their parents' talk; they often begin to recognize their own name in *silbo* before they are a year old.

The fact that the whistled language depends only on pitch explains why it can be understood at much greater distances than ordinary shouted speech. The sounds of ordinary speech are complex waves containing a number of harmonics. What makes such speech unintelligible at a distance is the loss of the weak harmonics and transients. On the other hand, a whistled signal, the meaning of which does not depend on timbre but is determined solely by pitch, will be understood perfectly so long as it is heard at all.

How does the *silbo*, using only variations in the pitch of a whistle, express the sounds of Spanish? It is fortunate that the language is Spanish; it would be vastly more difficult to whistle English, for English has a complex phonetic system. The Spanish phonetic system, especially in the Gomero dialect, is almost the simplest possible: it has comparatively few different vowel and consonant sounds, and relatively little contribution to meaning is made by stress, rhythm or intonation. All the *silbador* has to do is put the tip of his tongue against his teeth, start whistling and, at the same time, try to articulate words as if he were speaking normally. A practised *silbador* can whistle intelligibly everything he can say in the Spanish language. The whistle does not differentiate all the consonants in the spoken language, but when the *silbador* whistles words and sentences, the context makes his meaning unambiguous. Like ordinary speech, the *silbo* is differentiated into dialects and even individual styles. Each *silbador* has his own delivery.

Nothing better illustrates how commonly the Gomeros use the *silbo* than an experience Classe had one day in the wilds of the middle of the island. He was climbing the central mountain and all around in the woods were blackbirds whistling, not their own bird songs but, unmistakably and with excellent articulation, the *silbo* for the names 'Felipe', 'Alfonso', 'Frederico' and so on. In each case the bird prefixed the name with the attention-calling sound 'ah', which invariably precedes a call in the *silbo*.

The *silbo* of La Gomera is by no means the only whistled language in the world; but it is the most explicit. Other whistled forms of communication, found in Mexico and some parts of Africa, are made up of the tones, isolated from the other elements of speech, and convey meaning by a kind of musical accent. Generally speaking these other whistled languages are far less accurate, less explicit and more limited in power of expression than the *silbo*. The *silbo* is of great interest to a linguist because it does without what is commonly thought to be the one indispensable feature of normal speech: namely, variation of tone quality.

PASSIVATION OF IRON BY CHROMATE SOLUTIONS

ESTIMATIONS, in this Laboratory[1] and elsewhere[2], of the amount of chromium in the protective films formed on iron during immersion in potassium chromate solution have been reported. Further measurements in this Laboratory, using the radioactive tracer technique previously reported[1], have yielded results apparently of considerable theoretical interest. Publication of these results (apart from summaries in "Chemistry Research"[3]) has been delayed because of some uncertainty concerning the effect of the method of preparation of the radioactive potassium chromate solution (labelled with chromium-51) on the absolute figures for uptake of chromium, though it has been apparent for some time that the figures obtained have given useful relative results. (It is desirable to record here that slow precipitation of trivalent chromium in some earlier solutions[1] led to an incorrect conclusion concerning the effect of concentration of chromate on uptake of chromium; the concentration now appears to have little effect on uptake.) In view of the wide interest in the mechanism of corrosion inhibition, passivity and film growth at room temperatures, it now seems opportune to publish an abbreviated account of some of these results.

A family of curves has been obtained (Fig. 1) by plotting uptake of chromium against $\log_{10}(t_s + 1)$ (where t_s is time of immersion in chromate), for various times of pre-exposure of the specimens to air (t_a) before immersion. The nature of this family of curves has been interpreted as follows. The curve for the relatively short time $t_a = 5$ min. shows that uptake of chromium is a linear function of the logarithm of time. If it is reasonably assumed that the chromium, which has been detected only as Cr^{3+} (presumably in the form of Cr_2O_3), constitutes a constant proportion of the growing film, this relationship with time also applies to the film growth. The remainder of the curves (t_a greater than 5 min.) show the same 'logarithmic' film growth in chromate solution, but are displaced downwards because growth of the oxide film had already started in air before immersion of the specimen in the chromate solution; a straight line plot of growth v. log (time) can only be obtained if both growth increments and time are measured from the moment of start of growth. It can readily be shown that uptake curves for chromium (t_a not negligible) should, starting from a common origin, become parallel to the original straight line (t_a negligible), when t_s is very much larger than t_a, and that, further, this parallel portion will be displaced downwards by an amount proportional to the growth already present at the new starting point. It has, in fact, been found that this downward displacement is proportional to $\log_{10}(t_a + 1)$ for the various curves,

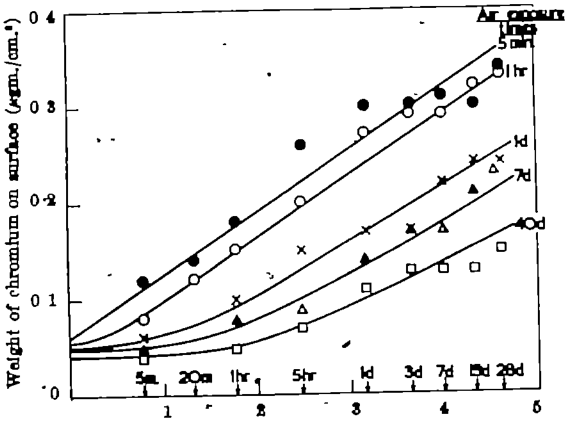

Fig. 1. Uptake of chromium by mild steel immersed in 0·005 *M* radioactive potassium chromate solution, *p*H 7·5, after exposure to air for different periods, v. $\log_{10}(t_s + 1)$. (t_s = time of immersion in minutes)

thus demonstrating, in addition, that oxide growth in air before immersion is also a linear function of the logarithm of time.

Since film growth in air and in chromate solution are both linear functions of log (time), differing only in their rate constants, it is concluded that the growth mechanism in the two conditions is identical. Dr. O. Kubaschewski, of the Metallurgy Division, National Physical Laboratory (private discussion), has related this mechanism to Hauffe and Ilschner's[4] extension of a theory of Mott[5]. According to this extended theory, the rate of growth of very thin films is controlled by electron transfer through the film. Provisional estimates of the thickness of the films after some two to three weeks growth in air or chromate based on a ratio of iron to chromium in the 'chromate-grown' film of 3 : 1 are of the order of 40–60 A. Preliminary calculations (Brasher, D. M., and Nurse, T. J., unpublished results) have shown the relative oxidation-rates to be of the expected order; final calculations must await further experimental results both on uptake of chromium and on iron chromium ratios in the stripped films.

We thank Dr. F. Wormwell and other colleagues in the Corrosion and Radiochemical Groups for useful discussions and the Radiochemical Group for estimating the radioactivity on the specimens. The work was carried out as part of the corrosion research programme of the Chemistry Research Board, and this communication is published by permission of the Director of the Chemical Research Laboratory, Department of Scientific and Industrial Research, and of the Senior Representative in the United Kingdom of the Australian Department of Supply.

A. H. KINGSBURY*
A. D. MERCER

WORK subsequent to that described above has demonstrated that the rate of uptake of chromium, and hence presumably the rate of oxidation by chromate ion, is considerably influenced by the amount of oxygen in the solution (Fig. 1). The rate in a solution saturated with nitrogen is more than double that occurring in the same solution saturated with oxygen. It would appear that oxygen and chromate ions compete in oxidizing the iron surface.

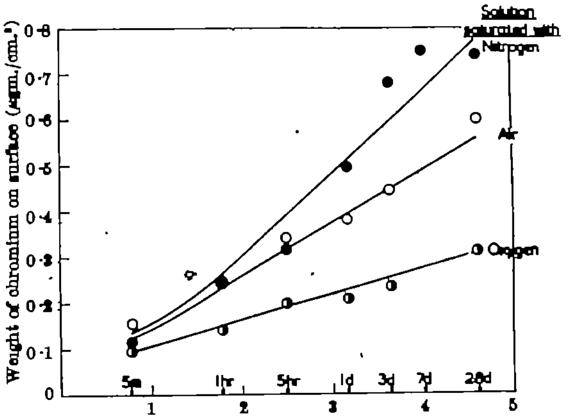

Fig. 1. Effect of dissolved oxygen on uptake of chromium by mild steel immersed in 0·005 *M* radioactive potassium chromate solution, *p*H 7·5. Specimens pre-exposed to air for 1 hr. (t_s = time of immersion in minutes)

Reference to Fig. 1 in the previous communication shows that the curves all cut the chromium uptake axis at approximately the same point, representing about 0·05–0·1 μgm. chromium/sq. cm. This was then considered to represent an adsorbed layer, the true chromium uptake curve probably rising rapidly from zero before forming part of the series of logarithmic growth curves. This assumption seems reasonable, since the total amount taken up corresponds approximately to a monolayer, and is (virtually) independent of the age of the oxide film at the moment of immersion. Points on the curve near the origin have now been obtained (Fig. 2) and clearly show the rapid formation of this layer before the true 'logarithmic' film growth begins.

The picture of inhibition by chromate can now be imagined somewhat as follows. Immediately on

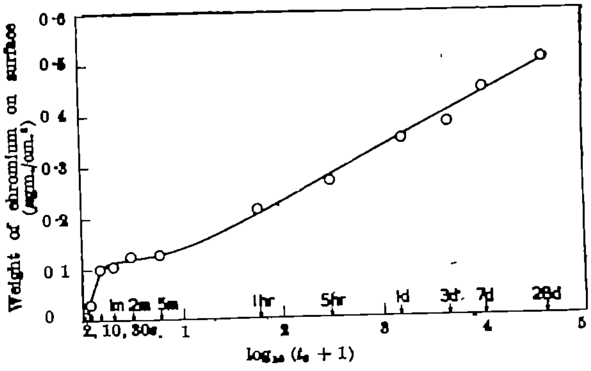

Fig. 2. Chromium uptake by mild steel immersed in 0·005 *M* radioactive potassium chromate solution, *p*H 7·5. Specimens pre-exposed to air for 1 hr. (t_s = time of immersion in minutes)

immersion of the iron or steel in the chromate solution, an adsorbed layer containing chromium ions is formed. This is followed by 'logarithmic' growth of an oxide film, with an adsorbed film always present. It is not possible, at this stage, to distinguish between the relative contributions, towards inhibition, of the adsorbed layer and the chromium-containing oxide film, since both are always present, though it is known that the longer the period of immersion, that is, the thicker the oxide film, the greater the degree of protection[1].

BINDING IN HÆMOGLOBIN AZIDE AS DETERMINED BY ELECTRON RESONANCE

Electron Resonance Studies of Hæmoglobin Azide and Hydroxide Derivatives

PREVIOUS investigations[1,2] of the ionically bound acid-met- and fluoride hæmoglobin derivatives have shown that electron resonance methods are able to give very precise information concerning both the orientation of the hæm planes and also the binding of the iron atom to its immediate neighbours. We have now made a series of detailed measurements on the 'covalently bound' derivatives and some of the initial results are summarized here to illustrate the further information that can be deduced. The experiments have been carried out in the manner previously described[1], with radiation of frequencies of either 25,000 Mc./s. or 36,000 Mc./s. and at liquid hydrogen temperatures with the d.c. magnetic field rotated around the crystal under investigation.

If the iron atom is held with strong covalent d^2sp^3 octahedral bonds, two of the $3d$ orbitals will be used by bonding electrons and the five magnetic electrons of the ferric ion will be left with only the three remaining $3d$ orbitals to fill, and hence will pair in two of these leaving a single unpaired electron spin. In terms of the more precise molecular orbital picture, this is equivalent to a large splitting produced between the $d\gamma$ and $d\epsilon$ levels (or, in Mulliken's notation, the e_g and t_{2g} levels respectively) of the $3d$ configuration, so that the five electrons will fill the $d_{xy}d_{yz}$ and d_{zx} orbitals of the t_{2g} group, and do not enter the e_g levels. The single unpaired spin should therefore produce one electronic transition per iron atom, from the lowest Kramers's doublet, with g factors spread across the free-spin value. From a detailed analysis (following communication) of these g-values it is then possible to deduce which of the t_{2g} levels is lying lowest, and to obtain some idea of what type of σ- or π-bonding is therefore to be associated with the iron atom (see the following communication).

Quite apart from this information on the chemical binding, further details on the structural symmetry of the surroundings of the iron atom can be obtained, since the variation in g-value no longer has axial symmetry, as in the ionic derivatives. Three mutually perpendicular axes are therefore individually defined by the results and these can then be correlated between different crystal forms to indicate equivalent directions within the hæm plane in different crystals. The results thus give information, not only on the orientation of the plane of the hæm group, but also on directions within the hæm group.

The azide derivative has been studied in most detail so far, and plots of the variation in g-value have been made for three perpendicular planes and for the plane of the hæm group in both type *A* and type *F* crystals[3]. Since the azide derivative can be obtained by converting the acid-methæmoglobin crystals *in situ*, it is very useful to take the conversion to only partial completion and study both spectra in the same crystal. The variation in g-value of the acid-methæmoglobin derivative can then be used as a very sensitive check on the orientation of the plane under investigation, the g-value remaining constant at 6·0 when the magnet is rotated around the hæm plane itself[1]. From a careful analysis of these results the variation in g-value of the azide derivative with respect to the hæm plane can be deduced, and this is shown in Fig. 1. The maximum value of 2·80 is in the direction of the hæm plane normal, with the other two axes lying in the hæm plane itself.

Theoretical analysis of these results shows that the d_{xy} orbital must be lying lowest in the t_{2g} group,

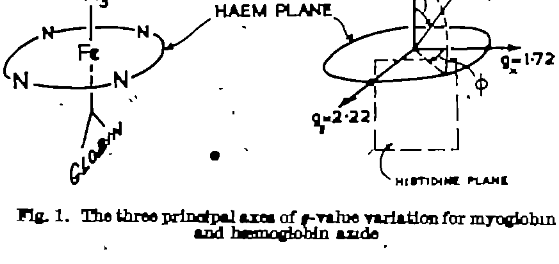

Fig. 1. The three principal axes of g-value variation for myoglobin and hæmoglobin azide

some 600–1,000 cm.$^{-1}$ below the d_{xz} orbital. This, in turn, lies about the same distance below the d_{yz} orbital. The latter separation may well be related to the less than fourfold symmetry imposed on the site by the histidine group of the globin. This is discussed in more detail in the following communication. The structural symmetry can be best expressed by quoting the g-value in the general direction (θ, φ), θ being the angle to the hæm normal and φ that between the axis of minimum g-value and the projection on to the hæm plane. Then: $g^2_{\theta,\varphi} = g^2_z \cos^2\theta + g^2_x \sin^2\theta \cos^2\varphi + g^2_y \sin^2\theta \sin^2\varphi = 7{\cdot}84 \cos^2\theta + 2{\cdot}96 \sin^2\theta \cos^2\varphi + 4{\cdot}93 \sin^2\theta \sin^2\varphi$.

A detailed analysis of the results from several other crystal types is now in hand, based on this equation, to deduce equivalent directions within the hæm plane for the different crystal types.

The myoglobin and hæmoglobin hydroxides are of particular interest, as on initial conversion from the acid-methæmoglobin derivative a g-value variation identical to that of the azide derivative is obtained. When the pH is increased, however, an entirely new electronic transition appears with a much larger variation in g-value, showing that a new type of chemical bond is formed at a certain pH value. Further work is in hand to elucidate the exact conditions at which this occurs. Other derivatives are also being studied so that a detailed picture of the molecular orbital patterns and symmetry of the surroundings of the iron atom can be obtained.

We would like to thank Dr. J. C. Kendrew, Dr. K. A. Munday and Thelma M. Haughton for a supply of large single crystals.

Theory of Electron Resonance in Ferrihæmoglobin Azide

IN the preceding communication, g-values were reported for ferrihæmoglobin azide. Here I give a theoretical interpretation of them, using the simplest plausible model for the five d electrons—that obtained by considering the matrix elements of the spin-orbit coupling, magnetic field energy and a rhombic distortion along the Cartesian axes within the six-dimensional manifold t^5_{2g} formed from pure $3d$ orbitals (see Howard[1], Stevens[2], Bleaney and O'Brien[3]). Such a discussion is very illuminating and probably gives the main qualitative features of the situation adequately. It is hoped to publish a more detailed treatment at a later date.

The z-axis is at right-angles to the hæm plane and we quantize the d orbitals with respect to it. Thus $| m >$ represents a $3d$ orbital with $l_z = m\hbar$, and we write α,β for the spin functions with $m_s = \frac{1}{2}, -\frac{1}{2}$, respectively. The three orbitals belonging to the representation t_{2g} of the associated cubic group are then $| 1 >$, $| -1 >$ and $| \zeta > = \frac{1}{2}\sqrt{2}\,(| 2 > - | -2 >)$. As customary, we denote the states of the ground manifold by giving the quantum numbers of the electron missing from the t^6_{2g} closed shell. Thus $| 1\alpha >$ stands for $| 1\beta, -1\alpha, -1\beta, \zeta\alpha, \zeta\beta >$, etc. Then we suppose d_{xz}, d_{yz}, d_{xy} to have energies $-\frac{1}{2}V$, $\frac{1}{2}V$, Δ respectively (again these symbols all represent holes in t^6_{2g}, not single-electron functions). The spin-orbit energy is then $-\lambda\, \mathbf{l}.\mathbf{s}$ (with $\lambda > 0$) and we have two 3 × 3 matrices (see ref. 3) for determining the zero-field energies and eigenfunctions. The two matrices are conveniently combined in Table 1.

Table 1. MATRICES FOR THE GROUND MANIFOLD OF HÆMOGLOBIN AZIDE IN ZERO MAGNETIC FIELD

	$\lvert 1\alpha >$ (or $\lvert -1\beta >$)	$-\lvert \zeta\beta >$ (or $+\lvert \zeta\alpha >$)	$\lvert -1\alpha >$ (or $\lvert 1\beta >$)
$\lvert 1\alpha >$ (or $\lvert -1\beta >$)	$-\frac{1}{2}\lambda$	$\frac{1}{2}\lambda\sqrt{2}$	$\frac{1}{2}V$
$-\lvert \zeta\beta >$ (or $+\lvert \zeta\alpha >$)	$\frac{1}{2}\lambda\sqrt{2}$	Δ	—
$\lvert -1\alpha >$ (or $\lvert 1\beta >$)	$\frac{1}{2}V$	—	$\frac{1}{2}\lambda$

The ground doublet, then, must be of the form

$$\psi^+ = A\,| 1\alpha > + B\,| \zeta\beta > + C\,| -1\alpha >,$$
$$\psi^- = A\,| -1\beta > - B\,| \zeta\alpha > + C\,| 1\beta >,$$

with g-values

$$g_x = 2\,|(\sqrt{2}\,A + B)(\sqrt{2}\,C - B)|,$$
$$g_y = 2\,|(\sqrt{2}\,A + B)(\sqrt{2}\,C + B)|,$$
$$g_z = 2\,|(2A^2 - B^2)| \text{ (see ref. 2).}$$

Without loss of generality we take A, B, C real and $(\sqrt{2}\,A + B)$ positive. Putting $p = \sqrt{2}\,A + B$ we readily find $g^2_x + g^2_y + g^2_z = 4p^2\,(4 - p^2)$, whence, using the values observed by Gibson and Ingram, $\vec{g} = (1{\cdot}72, 2{\cdot}22, 2{\cdot}80)$, $p = 1{\cdot}504$ or $1{\cdot}319$. A simple way of obtaining A, B and C is to use these p and the observed g_z. Then there turn out to be just two solutions with $A^2 + B^2 + C^2 = 1$, one for each value of p. I give the resulting g-values in Table 2. It is clear that we should take $p = 1{\cdot}319$ and then the agreement with experiment is comparable with that obtained[3] by the same model for $K_3Fe(CN)_6$, and might be improved slightly by a more judicious fitting of parameters (the particular method of fitting adopted by Bleaney and O'Brien[3] gives worse agreement in our case, however).

Table 2. CALCULATED AND OBSERVED g-VALUES FOR HÆMOGLOBIN AZIDE (g_z ASSUMED)

	$p = 1{\cdot}504$	$p = 1{\cdot}319$	Observed
g_x	0·93	1·62	1·72
g_y	2·65	2·30	2·22
g_z	(2·80)	(2·80)	2·80

For $p = 1{\cdot}319$, it transpires that $(A, B, C) = (0{\cdot}842, 0{\cdot}128, 0{\cdot}525)$, and since these values give $\psi\pm$ as eigenfunctions, we can work back and use the matrices shown in Table 1 to give us relations between the values of V, Δ and λ. Doing this, one obtains $V = -2{\cdot}26\,\lambda$, $\Delta = 3{\cdot}32\,\lambda$. Using the matrices of Table 1, we can then work out in terms of λ the relative positions of the three Kramers's doublets. The results are summed up in Fig. 1 with energies in terms of λ and, in brackets, in cm.$^{-1}$ assuming that $\lambda = 435$ cm.$^{-1}$ (from free-ion data; there is a possibility, however, that λ might be as low as about 280 cm.$^{-1}$, at least in $K_3Fe(CN)_6$ (see ref. 3)).

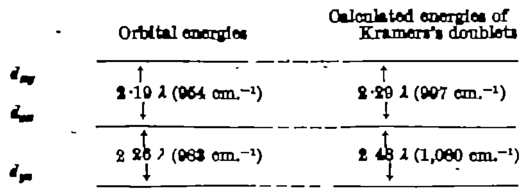

Fig. 1. Energies in hæmoglobin azide derived from observed g-values (d-functions are holes in t_{2g}^6)

Fig. 1 refers to holes in the t_{2g}^6 shell and so, for one-electron functions, we have the result that adjacent pairs of the three functions (d_{xy}, d_{xz}, d_{yz}) are separated by approximately equal amounts (of some 600–1,000 cm.$^{-1}$) and with d_{xy} lying lowest. This is remarkably interesting, for one might have expected the reverse to be true, on the grounds that d_{xy} cannot π-bond appreciably with any of the groups ligated to the iron, but d_{xz} and d_{yz} can π-bond with the porphyrin ring, and probably, at least for one of them, with the other ligands attached to the iron. Then should not d_{xy} be the least rather than the most stable ?

I cannot go into this problem in detail here, but point out that the anomalous result may be, at least in part, due to the d_{xy} orbital being fairly well away from the directions in which the negative charge of the ligands is mainly concentrated. In the plane of the hæm the nitrogen electrons which are not σ-bonding with Fe are tied up in the N—C σ-bonds. However, out of the plane of the hæm the nitrogen π-electrons are probably on the whole closer to the iron atom. Of course, I realize that the N—C σ-bonds also can be combined to give an orbital around the nitrogen atom of π-type with respect to the Fe—N bond—I suggest, however, that there may be a larger electron density π to the porphyrin plane (see ref. 4) and also that the N—C σ-bonds contract slightly under the influence of the carbon nuclear charge so that the π-type nitrogen orbital obtained from them is not pure $2p\pi$.

With such an interpretation one would say that the total effect of π-interaction in this case is to raise the energy of the interacting d-orbitals. If so, then it may be that the least stable orbital, d_{yz}, is that which is the most exposed to π-interaction and therefore if there is an iminazole ring attached to the iron atom it lies in the xz plane. Another way of putting this is to say that the direction of the smallest g-value lies along the orthogonal projection of the plane of the iminazole ring on the hæm plane. I emphasize that this final deduction is very tentative indeed and is really only inserted to provoke discussion. It does, however, underline that electron resonance and its interpretation afford a possibility of finding even such intimate details of the environment of the iron atom as the orientation of the, at present hypothetical, iminazole ring.

I am greatly indebted to J. F. Gibson and D. J. E. Ingram for making the experimental data discussed here available to me prior to its publication.

MUTAGENIC RESPONSE TO THE ALKYL-METHANESULPHONATES DURING SPERMATOGENESIS IN *DROSOPHILA MELANOGASTER*

By DR. O. G. FAHMY and DR. MYRTLE J. FAHMY

Chester Beatty Research Institute, Institute of Cancer Research, Royal Cancer Hospital, London, S.W.3

Introduction

THE degree of genetic damage induced by a given dose of a mutagen in a cell population undergoing differentiation varies with the cell stage at the time of treatment. Thus when an adult *Drosophila* male is injected with a single dose of a chemical mutagen and then its germ line is fractionated by repeated matings to successive virgin females, the mutation-rate shows significant variations in the successive broods[1–3]. Since the sperm used in the successive matings must have been derived from progressively younger germ cells at the time of treatment, the fluctuations in the mutation-rate have been attributed to differential genetic response of the stages of spermatogenesis to the action of the mutagen. In this communication it is intended to analyse this pattern of genetic response to the action of different alkyl-methanesulphonates, and to reveal how far this analysis helps in the elucidation of the mechanism of mutagenesis.

Brood Technique and Cell-Stage Utilization

The testis of an adult *Drosophila* male presents an uninterrupted spectrum of differentiation from spermatogonia through spermatocytes and spermatids to mature sperm[4]. Any attempt at fractionating this continuous germ line into separate cell stages by repeated matings is bound to be very rough and approximate. Indeed, we have shown that even for the same mutagen and the same strain, significant alterations in the brood-mutation pattern may occur in replicate experiments[3]. Nevertheless, it was possible to trace most of the factors responsible for the above variations, and modify our technique so as to eliminate or reduce the variables. Reasonable consistency has been achieved when great care was exercised in standardizing the experimental method, both in relation to the animals themselves and the mating procedure. We therefore developed a standard brood technique[2,3] in our laboratory and applied it for all the mutagens investigated. The males used

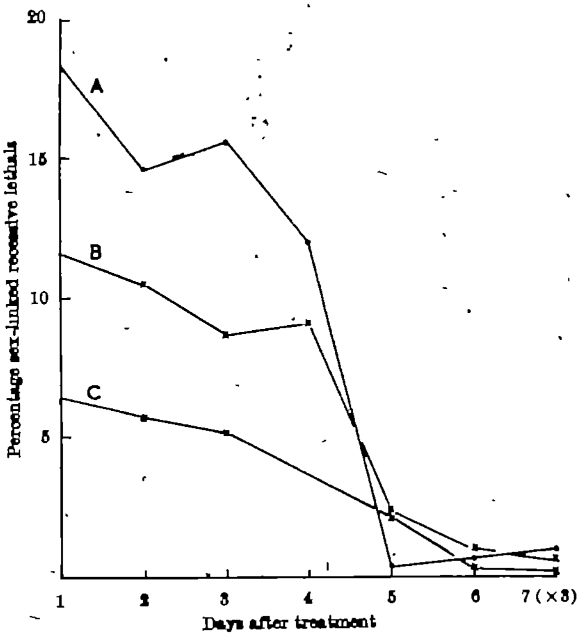

Fig. 1. Sex-linked recessive lethals in successive broods for ethyl methanesulphonate (curve *A*), and methyl methanesulphonate (curves *B* and *C*); based on data in Table 1

were from the Oregon-*K* stock and were selected at an age of 30 ± 5 hr., and weighed 0·85 ± 0·05 mgm. The compound under test was dissolved in isotonic saline (0·4 per cent sodium chloride) and injected intra-abdominally around the testes. The concentration injected was as a rule well below the *L.D.*50-level. Each male received practically the same volume of solution, which was 0·25 ± 0·05 µl. The treated males were always mated 24 hr. after injection so as to allow the flies to regain their vigour and activity. The fractionation of the progeny into broods was undertaken by repeated matings to 3-day-old females every three days (calculated from the day of treatment), either in pair cultures, or in mass cultures with a sex-ratio of unity. The cultures were kept at a constant temperature of 25 ± 1° C. Under such conditions, it has been shown[2,3] that sperm ejaculated in the first four matings (4 broods: 12 days after treatment) has been derived from post-meiotic germ cells (sperm and spermatids), whereas sperm utilized in later matings (5th brood onwards: more than 12 days after treatment) has been derived from meiotic and premeiotic germ cells (spermatocytes and spermatogonia). The mutations which have been scored in the experiments to be reported here are the sex-linked recessive lethals and visibles detected by the Muller-5 technique.

Brood-Mutation Pattern of the Alkyl Methanesulphonates

The mutation yield of the various stages of spermatogenesis under the effect of ethyl methanesulphonate (*C.B.* 1528: $CH_3CH_2OSO_2CH_3$) and methyl methanesulphonate (*C.B.* 1540: $CH_3OSO_2CH_3$) has been investigated by our standard brood technique and the results are summarized in Table 1 and Fig. 1. There is a convincing similarity in the brood-mutation pattern of the two sulphonates presented. The general tendency is that the mutation-rate decreases the later the brood. At the higher doses for both compounds (curves *A* and *B*, Fig. 1), and in spite of the non-significant fluctuations in the first four broods, a gradual fall in the mutation-rate is clearly discernible. This fall then proceeds at a much sharper gradient from the fourth to the fifth brood, and the low mutation-rate thus reached is maintained to the end of the experiment at the seventh brood. At the lower dose of the methyl ester (curve *C*, Fig. 1) the fall in the mutation-rate is gradual and almost linear from the first to the seventh broods. The decrease in the mutation-rate the later the brood (and, therefore, the younger the germ cell at the time of treatment) has already been ascertained also for the di-(methanesulphonoxy)alkanes[4]. It is, therefore, certain that the above general trend is characteristic of the various compounds of the alkyl methanesulphonate series, irrespective of whether the molecule is mono- or di-functional as regards the sulphonoxy groups.

From the above brood-mutation pattern, and from previous considerations as regards the speed of utilization of the stages of the germ line in our standard brood technique, the following conclusion emerges. The alkyl methanesulphonates are most active on the later stages of spermatogenesis (sperm and latest spermatids); the response decreases the earlier the stage of germ cell differentiation, almost reaching the control level among the earliest germ cells, the spermatogonia.

The yield of the sex-linked recessive visibles in the successive broods under the effect of the alkyl methanesulphonates follows essentially the same trend as the lethals (Table 1). Likewise, the sperm

Table 1. Sex-linked Recessive Visibles and Lethals induced in the Successive Broods under the Effect of the Ethyl and Methyl Esters of Methanesulphonic Acid

Ratio visibles/lethals	0·27					0·21					0 26				

and latest spermatids give the highest yield of visibles. The overall ratio of visibles to lethals shows some variation among the various sulphonates. For both the mono-functional methanesulphonates (the ethyl and methyl esters) this ratio is 0·26 ± 0·01 (Table 1) and is, therefore, significantly higher than for the di-(methanesulphonoxy) alkanes, where it is 0·12 ± 0·02 (see ref. 5). It is to be noted that this ratio, even for the mono-methanesulphonates, is lower than that for 2-chloroethyl methanesulphonate (C.B. 1506), which gives an overall ratio of 0·42 ± 0·02 (see ref. 6).

Mechanism of Mutagenesis under the Alkyl Methanesulphonates

In a recent communication[6] we directed attention to the fact that for 2-chloroethyl methanesulphonate, the highest mutagenic response was in the very early germ cells (utilized more than 12 days after treatment), and the lowest was in mature sperm. This is the reverse situation to that produced with ethyl methanesulphonate, or indeed any other mono- or di-methanesulphonate so far investigated in our laboratory, where the maximal effect is on the later germ cells. By way of illustration we have given in Fig. 2 the actual experimental curve for the brood/mutation-rate under the effect of ethyl methanesulphonate (curve *A*, based on Table 1) and compared it to that for roughly the same injected molar concentration of the chloroethyl ester (curve *D*, based on the previously published data[6]).

From the chemical point of view, both ethyl and 2-chloroethyl methanesulphonate are potential alkylating agents, but the chemical reactivity of the sulphonoxy group is much higher in the former compound. The data of Davis and Ross[7] show that *in vitro* the hydrolysis constants for the sulphonoxy groups in water expressed as $k \times 10^{-7}$ sec.$^{-1}$ at 37° C. are: 164·8 for the ethyl ester, as compared to 2·4 for the chloroethyl ester, giving a ratio of 68·7 : 1. Expressed in another way, nearly 27 per cent of ethyl methanesulphonate is hydrolysed in water at 37° in 5½ hr., whereas only 20 per cent of the chloroethyl ester is hydrolysed under the same conditions in 10 days; the chlorine atom is not appreciably hydrolysed under the above conditions. While it is fully realized that *in vivo* the relative reactivity of the two sulphonates may be different, due to differential excretion, detoxication and other biochemical factors, yet it is virtually certain that 2-chloroethyl methanesulphonate is retained in the living tissue in an active (unhydrolysed) state for much longer than ethyl methanesulphonate.

The above difference in the chemical reactivity of the two sulphonates may explain some of the differences in their brood-mutation patterns (Fig. 2). The much higher mutation-rate induced in the sperm by ethyl methanesulphonate (as compared with the chloroethyl ester) could be associated with the higher chemical reactivity of its sulphonoxy group. Furthermore, due to this higher reactivity, the intra-cellular residue, which is not used up in the alkylation of the cell constituents, almost certainly becomes inactivated (by hydrolysis) before the first sperm sample is drawn in the first mating (within three days after treatment). The mutation-rate detected in the successive broods would then represent the response of the genetic material of the various cell stages for roughly the same time of treatment. 2-Chloroethyl methanesulphonate, on the other hand, because of its lower reactivity and hydrolysis-rate, may be retained within some cells in an active form for several days, at least for more than the 3-day period of one brood. In such circumstances, the biological activity would be expected to rise as a function of the time-concentration product, and it would be feasible to arrive at a situation where the mutation-rate would increase with the time after treatment, which is roughly what was found experimentally for the first three broods. From the third to the fourth brood, however, there is a significant drop in the mutation-rate. A four-fold statistical test for this drop (illustrated in Fig. 2; for data see Table 1, dose $1 \cdot 4 \times 10^{-3}$ *M*, ref. 6) gave $\chi^2 = 4 \cdot 05$, *D.F.* = 1, $P = 0 \cdot 046$. This trough in the mutation curve at the fourth brood under the effect of the chloroethyl ester probably indicates the end of the influence of the intra-cellular 'residual' compound. If such an active compound was retained throughout the differentiation of the cells utilized in the fourth brood, they would be expected to yield a higher (or at least the same) mutation-rate as those recovered in the third brood, rather than a lower rate as observed. It seems, therefore, that no appreciable amount of active 'residual' sulphonate remains in the germ cells more than 9 days after treatment.

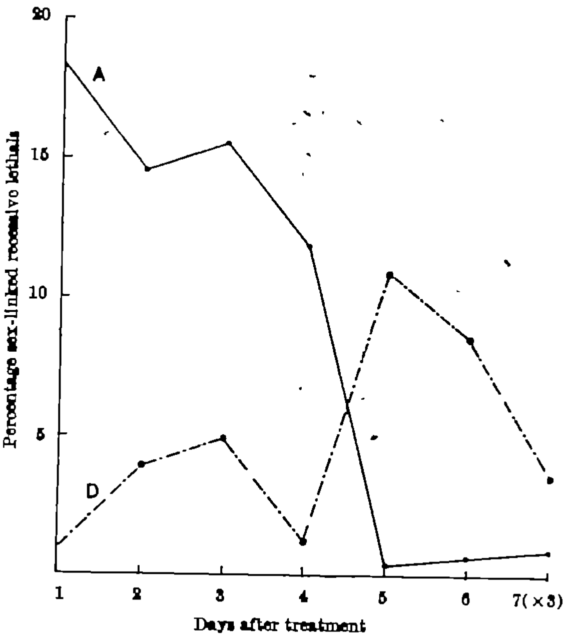

Fig. 2. Comparison of the brood-mutation patterns (sex-linked recessive lethal rate) for ethyl methanesulphonate (curve *A*, conc. $1 \cdot 6 \times 10^{-3}$ *M*, Table 1) and 2-chloroethyl methanesulphonate (curve *D*, conc. $1 \cdot 4 \times 10^{-3}$ *M*, data in ref. 7)

The most outstanding difference in the brood pattern of ethyl methanesulphonate as compared to the chloroethyl ester lies in the response of the early germ cells utilized later than the fourth brood. Whereas with the latter compound there is a sharp rise from the fourth to the fifth brood followed by the retention of a fairly high mutation-rate in later broods, the ethyl ester gives the exact opposite—a sharp drop from the fourth to the fifth brood and then a sustained low mutation-rate. The high mutation yield from the fifth brood under the effect of 2-chloroethyl methanesulphonate is probably not a function of time (that is, longer period of reaction between intra-cellular compound and the cell constituents), because of the presence of the trough in the mutation curve at the fourth brood. Two other explanations could, however, be postulated for the observed reversal of mutagenic efficiency on the early germ cells : (*a*) based on direct mutagenic action and differential cell stage response, or (*b*) based on indirect action and the production *in vivo* of a secondary mutagenic compound. Of course, these two mechanisms are not necessarily exclusive, and a combination of them might actually occur.

If the hypothesis of direct action is to be adopted, then we shall have to assume a very high grade of specificity between the chemical structure of the mutagen and the physico-chemical state of the genetic material during differentiation ; a specificity which is upset by a change in the alkyl group from ethyl to chloroethyl. It must be stated at once that there seems to be no evidence whatever for such a high grade of specificity. On the whole, alkylating agents of the same chemical series have roughly comparable brood-mutation patterns. Among the alkyl-methanesulphonates themselves, different compounds both mono- and di-functional (as regards the sulphonoxy groups) gave essentially the same cell stage-mutation pattern.

We are, therefore, left with the postulate that some type of indirect action must occur ; that under the effect of 2-chloroethyl methanesulphonate some 'secondary mutagen' is produced *in vivo* which is most active on the early germ cells and which is not formed from other alkyl methanesulphonates, including the ethyl ester. Evidence for the setting in of mutagenesis through indirect action under the effect of the chloroethyl ester is not entirely lacking. Unlike the other sulphonates it gives a mutation-rate which increases with dose only for the later germ cells (utilized in the first three broods), while for the earlier ones (utilized in the fourth–seventh broods) there is no direct relationship between the dose administered and the mutation yield.

The time of production of the secondary mutagen is not difficult to deduce. The peak of maximal mutability attributed to this agent occurred in the sperm sample utilized in the fifth brood. It is in this sperm sample also that the first 'visible' clusters appear, indicating that this sperm must have been derived from the latest germ cells which were capable of multiplication, after mutating by the treatment. This means that the germ cells most responsive to the action of the secondary mutagen are the latest spermatogonia, just before they start metamorphosing to spermatocytes. Now, it is known that under our experimental conditions spermatogonia differentiate into mature sperm within a period of 15 days[3]. It follows, therefore, that the lag in the detection of the genetic effects of the secondary mutagen can be entirely accounted for on the basis of the time needed for the responsive cells to complete differentiation. In other words the secondary mutagen must have been formed, and produced its effect, almost immediately after the injection of the chloroethyl ester.

As to the chemical nature of the secondary mutagen, the results of Roberts and Warwick[8] using ^{14}C-ethyl methanesulphonate (labelled on the α-carbon atom) are most relevant. Evidence has been obtained that this sulphonate alkylates the $-SH$ group of cysteine. It is likely that the effect of 2-chloroethyl methanesulphonate under *in vivo* conditions is comparable to that of the ethyl ester, in which case the reaction product would not be S-ethyl cysteine, but its chloroethyl analogue.

Chloroethyl cysteine has been synthesized in the Chemistry Department of this Institute and will be analysed for mutagenicity, to determine whether it gives a brood-mutation pattern of the type yielded by 2-chloroethyl methanesulphonate. Nevertheless, even at this stage, it may be stated that the genetical properties of the chloroethyl ester are not incompatible with the possibility that an amino-acid-mustard is produced *in vivo*. Recent work on the mutagenicity of the 'N-mustard' derivatives of phenylalanine shows that there are some features of its biological mode of action which are comparable to those brought about by 2-chloroethyl methanesulphonate. They are similar in so far as they produce high cytotoxic and mutagenic activity on the early germ cells—that is, among the premeiotic stages. Another comparable feature is that the phenylalanine mustard (particularly the *L*-derivative) yields a high ratio of visibles to lethals, which though not as high as for the chloroethyl ester, is nevertheless the nearest to it among the 'mustards' so far analysed[5,6].

To test the hypothesis of indirect action (through a metabolite) under the effect of 2-chloroethyl methanesulphonate we examined the brood-mutation pattern for fluoroethyl methanesulphonate (*C.B.* 1522, $FCH_2CH_2OSO_2CH_3$). This latter compound has the same low chemical reactivity (same hydrolysis-rate) as the chloroethyl ester, but would not be expected to produce *in vivo* a highly reactive 'mustard'. The mutation peak at the fifth brood which occurred with the chloroethyl ester, and which has been attributed to a strong secondary mutagen (presumably a 'mustard') would not, therefore, occur with the fluoroethyl ester. The genetical results so far obtained (to be detailed elsewhere) conformed with the biochemical expectation. Under the effect of fluoroethyl methanesulphonate the mutation-rate increased for the first three broods (reaching roughly half the rate induced by the same molar concentration of the chloroethyl ester) and then levelled off into a plateau until the seventh brood. There can scarcely be any doubt, therefore, that the high mutagenic response of the early germ cells under the effect of 2-chloroethyl methanesulphonate is an indication of the formation of a secondary, highly active mutagen. An attractive property of this mutagen is its potency in the induction of 'visibles'. It is, therefore, hoped that its successful identification and synthesis might well provide us with an agent highly selective for the induction of this class of mutation.

We wish to thank Prof. A. Haddow, Prof. F. Bergel and Dr. W. C. J. Ross for their interest and suggestions, and our other colleagues of the Chemistry Department of this Institute for their helpful discussion as well as the supply of the mutagens.

A Mechanism of Conversion of Fat to Carbohydrate in Castor Beans

THE mechanism of the interconversion of fat and carbohydrate, known to occur in germinating fatty seedlings, has not yet been established. It has been shown that the castor bean can utilize acetate carbons in the synthesis of sucrose, and that the labelling of the sugar after incubation of bean extracts with sodium acetate-^{14}C is consistent with the operations of glycolysis and the tricarboxylic acid cycle[1]. Yet these reactions are not by themselves sufficient to account for any net synthesis of carbohydrate from fat, but necessitate the occurrence of ancillary replacement reactions, whereby the intermediates drained from the cycle could be replaced directly by the breakdown of fatty acids. The 'glyoxylate by-pass' of the tricarboxylic acid cycle demonstrated in acetate-grown *Pseudomonas*[2] supplies such a replacement mechanism, which would also account for the observed labelling patterns. It was of interest, therefore, to investigate the possible occurrence of this by-pass in castor beans, particularly since malate is one of the earliest labelled products formed from labelled acetate in this tissue.

Cell-free extracts of the endosperm and cotyledons of castor bean seedlings four to five days old were prepared by macerating the beans in a Waring blendor in 0·1 *M* potassium phosphate, *p*H 7·5, filtering the juice through muslin and removing particles from it by high-speed centrifugation (25,000 *g*). When incubated anaerobically with *iso*citrate, both α-ketoglutarate and glyoxylate were formed by the actions of *iso*citric dehydrogenase (1) and *iso*citritase[3] (2). The amounts of glyoxylate present progressively decreased while those of α-ketoglutarate increased. Incubation of the extract with triphosphopyridine nucleotide and *iso*citrate, or reduced triphosphopyridine nucleotide and glyoxylate, showed that a reduced triphosphopyridine nucleotide-linked glyoxylic reductase was present in addition to *iso*citric dehydrogenase. These findings therefore suggest that glycollate arises from *iso*citrate by a coupled oxidation-reduction reaction :

*Iso*citrate + TPN → α-ketoglutarate + TPNH$_2$ + CO$_2$ (1)

*Iso*citrate → succinate + glyoxylate (2)

Glyoxylate + TPNH$_2$ → glycollate + TPN (3)

Sum : 2 *Iso*citrate → α-ketoglutarate + succinate + glycollate + CO$_2$ (4)

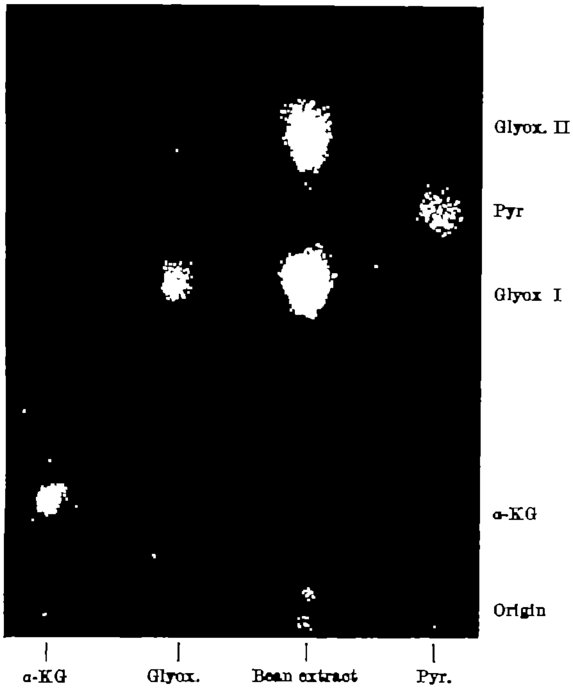

Fig. 1. Formation of glyoxylate from *iso*citrate by partially purified (0–30 per cent ammonium sulphate fraction) castor bean extract.
The α-keto compounds formed on incubation of extract with *iso*citrate were isolated as the 2,4-dinitrophenylhydrazones and analysed by paper partition chromatography (ref. 5). Derivatives of authentic α-ketoglutarate, pyruvate and glyoxylate were simultaneously analysed as standards. No detectable α-keto compounds were formed in the absence of *iso*citrate, or from *iso*citrate by boiled extract

The formation of glyoxylate from *iso*citrate, without concomitant formation of α-ketoglutarate, was demonstrated in partially purified extracts (Fig. 1). Extract from 1 gm. of beans catalysed the formation of at least 8 μmoles of glyoxylate/hr.

When cell-free extracts were incubated with *iso*citrate, ^{14}C-labelled acetate, coenzyme *A*, glutathione and adenosine triphosphate, malate was the only labelled compound formed. There was no incorporation of carbon-14 from acetate in the absence of adenosine triphosphate or *iso*citrate (Table 1).

Table 1. FORMATION OF LABELLED MALATE FROM ^{14}C-ACETATE
The complete system contained 100 μmoles of potassium phosphate *p*H 7·6, 10 μmoles of glutathione, 10 μmoles of magnesium chloride, 0·08 μmole of coenzyme *A*, 0·1 ml. of cell-free bean extract, 10 μmoles of *iso*citrate, 6 μmoles of adenosine triphosphate, 2 μmoles of sodium acetate-^{14}C (giving 7·4 × 10^{5} counts/min. under the conditions of radioassay used) and water to final volume of 1 ml., incubated at 30° for 15 min. Samples were analysed by two-dimensional chromatography and autoradiography.

System	Radioactivity of malate (counts/min.)
Complete system	6,500
No adenosine triphosphate	300
No *iso*citrate	510

This production of malate from acetate and *iso*citrate (7), catalysed by *iso*citritase (2) and malate synthetase[4] (6), is the overall reaction of the glyoxylate by-pass. These results therefore indicate that the glyoxylate by-pass operates in castor beans, and provides both a route for the interconversion of fat and carbohydrate and information on the origin of glycollic acid in this tissue.

*Iso*citrate → succinate + glyoxylate (2)

Acetate + ATP + CoA → acetyl CoA + (AMP + PP) (5)

Acetyl CoA + glyoxylate → malate (+ CoA) (6)

Sum : *Iso*citrate + acetate → malate + succinate (7)

Effect of Day-length and Gibberellic Acid on the Flowering of *Arabidopsis*

IT has recently been discovered[1] that a mixture of gibberellin *A* and gibberellic acid greatly accelerates the initiation of flowers in unvernalized *Hyoscyamus niger* L., a vernalizable long-day biennial plant. Even more recently, it has been found[2] that this mixture of compounds will cause flower formation under short-day conditions in *Bryophyllum crenatum* Baker, a plant which requires long-day for internode elongation, short day for floral initiation, and long-day again for the development of functional flowers[3].

With *Arabidopsis thaliana* (L) Heynh., a facultative long-day plant[4], pilot experiments have established that gibberellic acid will accelerate flower formation in non-vernalizable 'races' grown under short-day, and in non-vernalized, but vernalizable, 'races' grown under long-day conditions.

The data reported here were obtained with the rapidly growing race, Estland, which does not respond to vernalization. The experimental plants were grown on agar in 16 mm. × 150 mm. test-tubes under aseptic conditions, as described elsewhere[5]. They were grown under fluorescent light of about 900 foot-candles intensity at 23–25° C. in two growth chambers, one with 8 hr. light per day and the other with continuous light. When the plants under short-day were 19 days old, aliquots of Seitz-filtered gibberellic acid solution were added aseptically to half of them, to give 4 μgm. of gibberellic acid per plant. Plants under long day received 0, 1, 2, 4 and 8 μgm. per plant when 8 days old. Approximately ten plants were provided for each treatment. A plant was considered to be flowering when the first flower opened.

Table 1. THE EFFECT ON FLOWERING AND LEAF NUMBER OF DAY-LENGTH AND GIBBERELLIC ACID (G.A.)

Day-length (hr.)	Treatment	No. of plants	No. of rosette leaves	No. of cauline leaves	Days to flowering
8	Nil	9	12·2 ± 0·1	8·9 ± 0·3	67·6 ± 0·5
	4 μgm. G.A. per plant	10	8·3 ± 0·4	8·5 ± 0·8	50·5 ± 0·5
24	Nil	9	7·6 ± 0·2	3·5 ± 0·2	21·8 ± 0·4
	4 μgm. G.A. per plant	10	6·2 ± 0·2	4·2 ± 0·2	20·5 ± 0·4

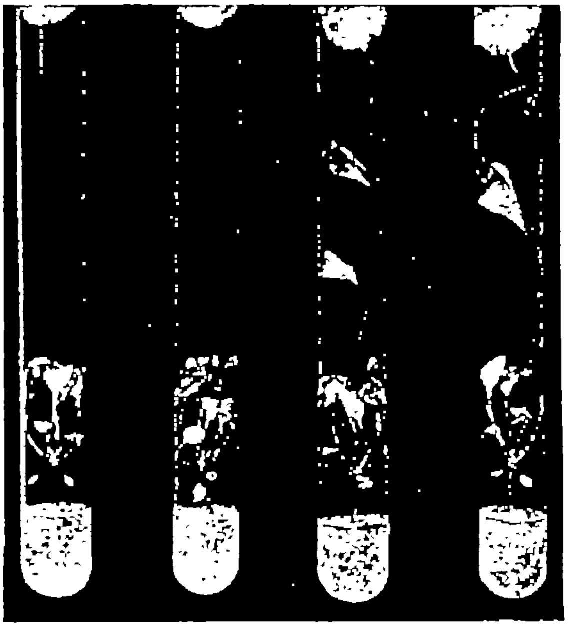

Fig. 1. *Arabidopsis thaliana.* Plants 47 days old, grown in 8-hr. day. Left, control; right, with 4 μgm. of gibberellic acid

Table 1 shows that there is a highly significant ($P < 0{\cdot}001$) acceleration of flowering when plants are treated with gibberellic acid and grown under an 8-hr. day (Fig. 1). A more complete replacement of day-length might be obtained by applying gibberellic acid more frequently. The presence of an interaction ($P < 0{\cdot}005$) between day-length and gibberellic acid is confirmed by the ability of the compound significantly ($P < 0{\cdot}05$) to decrease the time required for flowering under long-day. This effect cannot be due to a partial replacement of a vernalization requirement as in *Hyoscyamus*, for the mean time to flowering with seed vernalization (21 days at 5° C.) was 23·3 ± 0·4 days; with vernalization plus gibberellic acid, the time was 22·0 ± 0·5 days.

Table 2. THE EFFECT ON FLOWERING UNDER LONG-DAY OF A GEOMETRIC CONCENTRATION RANGE OF GIBBERELLIC ACID

Gibberellic acid per plant (μgm.)	No. of plants	Days to flowering
0	9	21·8 ± 0·4
1	10	21·0 ± 0·6
2	10	19·7 ± 0·4
4	10	20·5 ± 0·4
8	5	23·8 ± 0·9

An analysis of variance of the data shown in Table 2 yields a highly significant ($P < 0{\cdot}01$) F ratio for differences between treatment means. Individual t tests indicate a highly significant ($P < 0{\cdot}01$) acceleration of flowering with 2 μgm. of gibberellic acid per plant and a significant ($P < 0{\cdot}05$) inhibition of flowering with 8 μgm. per plant. With the latter treatment four plants became distorted, their apical meristems were damaged, and their flowering was much delayed; they were not included in the analysis.

Gibberellic acid is the first substance found that appears likely to be generally effective in promoting flowering. However, its effects on the long–short-day plant, *Bryophyllum*, and the facultative long-day plant, *Arabidopsis*, are in the nature of accelerations of flowering, and it remains to be seen if it will cause flower formation in an obligate long-day plant.

I thank Dr. P. W. Brian, of Imperial Chemical Industries, Ltd., Welwyn, England, for the gift of the gibberellic acid used in these experiments.

Metabolism of Acetate in *Hevea brasiliensis*

THERE is now considerable evidence to show that the synthesis of *iso*prenoid compounds in both plants and animals may proceed by the utilization of acetate as the sole primary carbon source[1,2], and that the pathways by which the *iso*prenoid monomer is derived from acetate may have a number of carboxylate intermediates in common, for example, ββ′-dimethyl acrylate and β-hydroxy-β-methyl glutarate[1,3]. Before taking part in these metabolic reactions acetate first undergoes activation by coupling with coenzyme *A*, and this form of carboxyl activation is then transmitted through subsequent intermediates arising from acetate. An examination of the latex and tissues of *Hevea brasiliensis* for such activation systems is briefly reported here.

Freeze-dried serum, obtained from fresh latex which had been kept at −20° for 3 weeks, was used in much of the work. Samples of freeze-dried 'yellow-fraction' (the yellow sediment obtained by centrifuging fresh latex at high speed) were also tested. Tissue samples were derived either from young seedlings grown in a greenhouse, or from fresh fragments of the cambial layer of mature trees. These fragments were packed in polythene sachets surrounded by 'dry ice', and transported from Malaya in Dewar flasks. This method has been generally useful in the preservation of cellular enzyme systems.

Hydroxylamine was used as a trapping reagent for activated carboxyl compounds in an assay system similar to that described by Beinert *et al.*[4]. Water-soluble hydroxamates were determined as the red ferric complexes by the method of Kornberg and Pricer[5]. Hydroxamate extracts were prepared for chromatography by adding an equal volume of ethanol to portions (2–5 ml.) of the incubation mixture, and evaporating the filtrate to dryness under reduced pressure. The dry residue was extracted with warm ethanol (0·5 ml.), and spots analysed on Whatman No. 1 paper with a solvent system composed of *n*-butanol/water/acetic acid (63 : 27 : 10 by vol.)[6].

Carboxyl activation was detected in freeze-dried serum one month after its preparation, hydroxamates being produced in incubation mixtures to which no acetate, adenosine triphosphate, or coenzyme *A* had been added. Addition of adenosine triphosphate and coenzyme *A* did not stimulate this inherent activity, but when extra acetate (10 μmoles) was supplied more hydroxamate was produced, and this reaction could be further increased by the addition of adenosine triphosphate (7 μmoles), but not of coenzyme *A*. Activity was not detected in boiled serum, and rapidly decayed in solutions kept at room temperature. The dried serum powders were also very unstable in storage at 0° C., the activity falling by a half during the second month after preparation.

Chromatography of the hydroxamates resulted in three spots, that with R_F value 0·48 being markedly increased by the addition of acetate to incubation mixtures, and corresponding exactly with authentic acethydroxamic acid. The remaining spots with R_F values 0·67 and 0·81 were not positively identified.

Attempts to detect free acid intermediates of *iso*prenoid synthesis suggested that much of the acetate administered to latex was directed towards respiratory metabolism. General increases were observed for acids of the Krebs cycle, and more particularly for succinic and fumaric acids. However, it should be mentioned that these two acids, under the different chromatographic conditions employed, behaved identically with two possible *iso*prenoid intermediates, namely, β-hydroxy-β-methyl glutaric and β-methyl glutaconic acids, respectively, so that the possibility of mixtures could not be ruled out.

In most samples of freeze-dried yellow-fraction, carboxyl activation was barely detectable, but in a few cases the activity approached that of a comparable amount of whole serum. This suggests that the yellow-fraction particles may be important loci of carboxyl-activating systems.

The greatest difficulty in the use of cambial tissue for experiment was due to the high concentration of tannins present. No soluble protein could be extracted at *p*H values lower than 8·5, and carboxyl activation was not detected in homogenates. After grinding with sand in *tris* buffer of *p*H 9·2 (0·05 *M*), and washing with fresh buffer, the homogenates were active, and some inactive protein could be extracted by magnesium sulphate solution (½ sat.). The activity was associated entirely with the bulky cell debris, every attempt to obtain soluble systems being unsuccessful.

I wish to thank the Dunlop Rubber Co., Ltd., for permission to publish this communication.

A Technique for the Measurement of Lead Tolerance in Plants

BRADSHAW reported[1] that root growth was inhibited when plants of *Agrostis tenuis* were grown in soil from the tip of an old Welsh lead mine, while plants originally growing on the tip produced normal roots. This suggested that some plants of *A. tenuis* were inherently more tolerant of the lead and zinc in the soil than others. On similar waste tips in Scotland, *A. tenuis* is replaced by *Festuca ovina* and *Deschampsia flexuosa*, and a method has been worked out for the measurement of lead tolerance in *F. ovina* from soils of different lead contents.

In preliminary experiments it was found that the toxicity of lead was greatly reduced by the presence of other salts. 3 p.p.m. of lead in the form of a pure solution of lead nitrate was highly toxic to all plants of *F. ovina*, while in a Knopp's culture solution (without phosphate because of the extreme insolubility of lead phosphate) many plants showed little reduction in root growth at 25 p.p.m. The salts used for making up the culture solution were then tested one at a time, and the only one which had any antagonistic effect to lead was calcium nitrate. It seemed of interest to find out whether the calcium or the nitrate ion was responsible.

Tillers of a single plant of *F. ovina* were rooted in water and then transferred to solutions of calcium nitrate, calcium chloride and sodium nitrate of equivalent concentrations. Lead nitrate and zinc sulphate were added gradually to two sets of cultures, so that the tillers were transferred each day one step up the series : 0, 1, 3, 10, 30, 100 p.p.m. of the metal, the concentrations of the accompanying salts being kept constant. The length of the longest root on each tiller was measured at each transfer and the amounts of growth in the different solutions compared. The two metals gave rather different results. In the case of lead, growth fell off very rapidly with increasing concentration in the presence of sodium nitrate, but in presence of calcium nitrate or calcium chloride growth was increased at low concentrations and only fell markedly at 30 p.p.m. and more. The calcium ion was clearly reducing the toxicity of the lead, while the nitrate ion had no such effect. In the case of zinc there was no stimulation at low concentrations and little sign of reduced toxicity in the presence of any of the three salts.

It was decided to use 1 gm./litre of calcium nitrate in all subsequent experiments so that higher concentrations of lead could be used without stopping all growth. The exact adjustment of the lead concentration would then be less critical, and slight loss by precipitation or adsorption less serious. It remained to find the most suitable concentration of lead for showing up possible differences between plants.

Five plants of *F. ovina* from different habitats were tillered and rooted in calcium nitrate. The rate of root growth in this solution was measured and found to vary little from one plant to another. The rate of growth was measured again after the addition of different concentrations of lead nitrate (Table 1).

It will be seen from Table 1 that the first differences between plants began to show when the lead concentration reached 10 p.p.m. Root growth in plants 140 and 197 was slowed down while plants 127, 154 and 191 were unaffected. It was satisfactory to note that the last three plants came from poisonous lead tips, 197 came from an old overgrown tip and 140 came from a hillside away from the mining area. At 30 p.p.m. the difference was more marked, the two intolerant plants being able to grow very little while the other three were slowed down slightly. At 100 p.p.m. very little growth took place in any of the plants.

Table 1. Rates of Root Growth (2-day Increments in mm.)

Lead added		0	3	10	30	100 p.p.m.
Plants :	127	19	18	13	11	4·0
	140	17	14	8	2·5	0·5
	154	24	22	14	11	2·0
	191	23	17	20	16	2·0
	197	21	19	9	3·8	3·0

For the routine testing of large numbers of plants a concentration of 25 p.p.m. of lead was eventually chosen, as this allowed a little growth in the least tolerant plants but still produced a slight check in that of the most tolerant. When the roots have reached a constant rate of growth, that rate is measured in calcium nitrate alone, and the amount of growth is again measured four days after the addition of lead nitrate. An index of lead tolerance is derived from these two growth-rates. The whole experiment is carried out at a temperature of 70° C. and with constant artificial light of about 500 foot-candles intensity.

A good range of responses is obtained from different plants, and it is already clear that those from any one tip tend to be similar. There is a reasonable correlation between the mean index for a tip and the amount of lead which can be extracted with 0·5 *N* acetic acid from the soil of that tip.

Action of Gonadotrophins on the Ovary

It is generally agreed that when an adequate dose of gonadotrophin is injected into the immature female mammal, secretion of œstrogen takes place in the ovary and this in turn causes the uterus to increase in weight. While it is not certain that œstrogen is the only uterine growth-promoting substance liberated by the ovary[1] at that time, this will not alter the interpretation of the findings presented here.

The time-response curve for the increase in uterine weight of immature mice shows a lag phase of up to 18 hr. duration, followed by a phase of logarithmic growth, the uterus reaching a maximum weight about 40 hr. after the injection. The (log dose) – (log response) line is linear over a twenty-fold range of dose, and may be used as a basis for a gonadotrophin assay. It is possible to gain information on the ovarian release of œstrogen by studying the response of the uterus in animals ovariectomized at various times after the administration of œstrogen-free gonadotrophin.

Immature female albino mice weighing about 10 gm. were used in an experiment with pregnant mare serum gonadotrophin, and randomized to boxes, five mice per box. The experimental design employed was a 3 × 4 factorial, one box of animals being allocated to each treatment combination. The factor varied at three levels was dose of gonadotrophin and at four levels the time of ovariectomy. The doses were chosen so that the responses they elicited fell on the linear segment of the (log dose) – (log response) line, and also so that they were equidistant on the logarithmic scale. The dose was administered in one subcutaneous injection of 0·1 ml. isotonic saline. The times of ovariectomy were measured from the time of injection, and chosen so that they were equidistant on the logarithmic time-scale. Thus at 5, 10 and 20 hr. after the injection of gonadotrophin, the animals of one group at each dose-level were

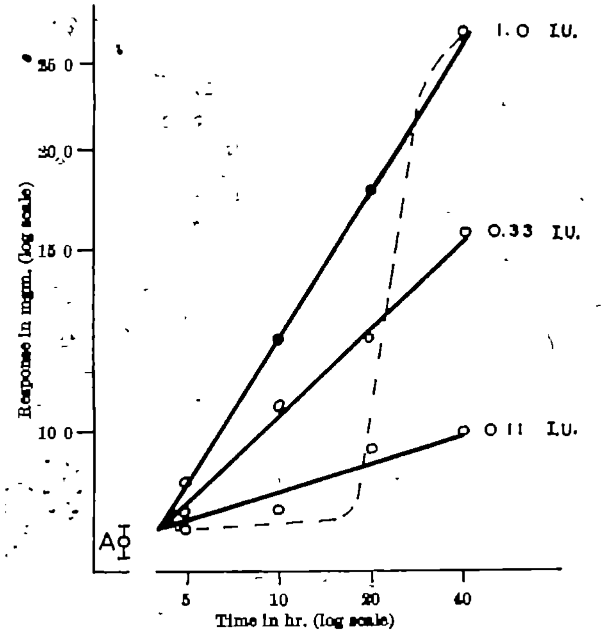

Fig. 1. Effect of various doses of pregnant mare serum gonadotrophin and the time of ovariectomy on the weight of the mouse uterus. — — —, the time-response curve for 1 I.U. of the gonadotrophin; O, experimental data in the 3 × 4 test. The mean control value (*A*) cannot be placed on the (log scale) since it corresponds with zero time; it has been plotted with a line of ± one standard deviation

ovariectomized under transient ether anæsthesia. All mice were killed and the weight of the uterus recorded 40 hr. after injection, when final groups due for ovariectomy at this time were also killed. Body-weight was recorded at death so that the logarithm of the response may be corrected for the logarithm of this weight by covariance.

After ovariectomy, the uterus continues to grow to a size which is related to the dose of gonadotrophin and the time of ovariectomy. This is shown in Fig. 1, where the (log, time) – ($\log_{10}$ response) line is drawn for each dose-level of gonadotrophin. It is apparent that the three lines intersect at a common point, a point also common to the control values obtained from mice ovariectomized at the time of injection (0 hr.), and killed with the others 40 hr. later. These control values were obtained on the same day as the experimental values in order that secular variation in response could be eliminated.

The analysis of variance of the experimental data permits the conclusions listed above and indicates that the data are described by a multiple regression equation of the following form:

$$Y = a + b_1x_1 + b_2x_2 + b_{12}x_1x_2 \qquad (1)$$

where Y is the expected value of ($\log_{10}$ response); b_1 is the regression coefficient relating response to (log dose), x_1; b_2 is the regression coefficient relating response to (log time), x_2; b_{12} is the regression coefficient relating response to the product of (log dose) and (log time); a is a constant.

The abscissa of the point of intersection of the time-response lines is given by the equation:

$$i(x_2) = -b_2/b_{12} \qquad (2)$$

and the variance of this estimate and its 95 per cent fiducial limits may be deduced using Fieller's formula[2]. The ordinate of the point of intersection [$i(y)$] may be obtained by substitution in equation (1).

A second experiment of the same type was carried out, using human chorionic gonadotrophin. These two preliminary experiments indicate that both gonadotrophins cause liberation of œstrogen by the ovary which is effective in the uterus 3·9 {2·6–5·8} hr. after injection. A combined estimate is given since no significant difference was obtained between the gonadotrophins. The ordinates are obviously not different from the control values:

	Pregnant mare serum gonadotrophin	Human chorionic gonadotrophin
Control	87·0 ± 1·46	88·5 ± 1·44
$i(y)$	86·7	86·8

This response has not previously been subject to quantitative study. Astwood[3] showed that the uterus responds rapidly to the subcutaneous injection of œstrogen. Water uptake begins 1–2 hr. after the administration of an effective dose. A maximum response is reached in a further 4 hr. Taking this result together with the estimate given above, it appears that the ovary must begin to liberate œstrogen into the blood stream as early as 2–3 hr. after the administration of gonadotrophin. The three time – response lines are linear over the range in question, and thus the ovary may well continue to produce œstrogen at least for 40 hr. after the initial stimulus; but since no studies have been made in which œstrogen has been withdrawn after early stimulation of the uterus, it is not possible to be certain of this. It is clear, however, that a single injection of either gonadotrophin is effective in causing the release of œstrogen.

While it is somewhat surprising that the two gonadotrophic preparations studied apparently act in a similar manner on the ovary, this is in line with other studies in this laboratory and elsewhere, raising some doubts about the separate identity of the two pituitary hormones, follicle-stimulating hormone and luteinizing hormone. These, however, are not identical with the hormones used by us in the present work, and little can be said without more work on the subject. The quantitative study of secondary responses after organ removal or ablation may prove fruitful in other fields.

This work was aided by grants from the New South Wales State Cancer Council and the Commonwealth Bank of Australia.

Carnosine and Carnosinase in Rat Tissue

Paper chromatography has been used for obtaining a qualitative picture of the distribution of carnosine and 'carnosinase' in the albino rat.

One-year old animals were killed by chloroform, the tissues removed and ground with acid-washed alumina and 5 ml. of 0·02 *N* potassium cyanide. This amount of cyanide, in control experiments, was found to inhibit completely the moderate 'carnosinase' activity of the uterus, but not the very strong activity of rat kidney.

Table 1

	(1)	(2)	(3)	Colour with diazo reagent
Histidine	0·21	0·07	0·19	red
Carnosine	0·20	0·07	0·36	red
Anserine	0·20	0·07	0·60	none
Histamine	0·24	0·24	0·40	red
Thiolhistidine	0·27	0·15	0·22	yellow
Ergothioneine	0·32	0·24	0·88	yellow
Urocanic acid	0·61	0·67	0·77	red

Solvents: (1) *n*-butanol – glacial acetic acid – water (60 : 15 : 25), (2) *n*-propanol – *N* acetic acid (3 : 1); (3) phenol – hydrochloric acid

The suspension of ground tissue was centrifuged and the protein in the supernatant precipitated with 10 per cent trichloracetic acid, the excess of which was removed by extracting three times with ether. The clear solutions were taken to dryness *in vacuo* over sulphuric acid and the residues dissolved in 10 per cent *iso*propanol. Chromatograms were run on Whatman No. 4 papers in phenol–hydrochloric acid[1] (200 ml. of 80 per cent phenol equilibrated overnight with a mixture of 120 ml. concentrated hydrochloric acid and 40 ml. of water placed in a separate container at the bottom of the tank). The chromatograms were dried and hung in the air for 4–5 days to remove traces of phenol then developed with diazotized *p*-anisidine[2], a reagent which will detect 0·2 μgm. of carnosine on the paper. A list of R_F values is given in Table 1.

'Carnosinase' activity was measured in tissues from a rat killed by a blow on the head. The tissue was ground with acid-washed alumina and 5 ml. of 0·18 *M* borate buffer *p*H 8·0 and the mixture divided into two portions, one of which was boiled to serve as a control. The tissues and buffer were added to stoppered tubes containing 1 mgm. of carnosine and incubated at 37° C. for 3 hr. After the incubation the mixture was centrifuged and the supernatant deproteinized, etc., as described above.

Hydrolysis of carnosine was revealed by the appearance of a histidine spot not present in the controls. The amounts of material placed on the paper in these enzyme experiments were such that the small amounts of histidine present in the tissues did not show up.

In addition to rat tissues, toad stomach was investigated. A toad was pithed, the stomach removed, washed in Ringer's solution and the mucosa peeled away from the smooth muscle coat. The results are given in Table 2.

Since stomach was the only tissue, apart from striated muscle, in which carnosine was detected, the experiments on rat and toad stomachs were repeated several times. The material was run in all three solvents together with carnosine added to the extracts. The characteristic blue colour with ninhydrin was developed as described by Yudaev[3], and served as further evidence that the substance was in fact carnosine.

Table 2

	Carnosine	Histidine	Carnosinase activity
Rat			
Stomach	++	+	+
Spleen	−	+	+
Kidney	−	+	++
Uterus	−	+	+
Liver	−	++	++
Heart	−	+	++
Diaphragm	+	+	+
Bladder	−	trace	+
Muscle	++	+	trace
Blood serum	−	+	−
Blood cells	−	trace	−
Lung	−	trace	++
Brain	−	trace	++
Small intestine	−	+	++
Toad			
Smooth muscle	trace	−	−
Mucosa	++	−	+

From the results it is clear that nearly all tissues can hydrolyse carnosine but that carnosine itself is present only in striated muscle and stomach. The function of carnosine is obscure and its presence in a non-muscular tissue like gastric mucosa is of considerable interest.

I wish to thank Miss M. Wooldridge, who carried out the estimations on the tissues.

Application of Ethylenediaminetetra-acetic Acid in the Isolation of Crustacean Chitin

ISOLATION of 'chitin' {which generally connotes a polysaccharide comprising units of 2-acetamido 2-deoxy-D-glucose (N-acetyl-D-glucosamine)} from the cuticles of crustaceans usually involves[1] decalcification; for example, treatment with *N* hydrochloric acid followed by repeated, prolonged extraction of the insoluble residue with *N* sodium hydroxide at 100°. The material remaining undissolved by this treatment is termed 'chitin'. Such drastic treatment may well effect structural changes in the chitin, such as removal of pendant groups (protein or peptides), de-N-acetylation and fragmentation. Little is known of the mode of association of chitin with protein and a knowledge of this is of importance in studies of the biosynthesis and biological function of chitin.

In seeking milder methods for the isolation of chitin, we have studied the action of ethylenediaminetetra-acetic acid on the cuticle of the edible crab, *Cancer pagurus*. Only those parts of the fresh, cleaned, air-dried cuticles which were free from hairs were used. Large (1 cm.^{2}) cuticle fragments were attacked slowly (50 per cent loss in weight in two weeks) by ethylenediaminetetra-acetic acid at *p*H 9. Powdered shell {particle size 1–10μ; ash (as oxide), 45 per cent; spectrographic analysis: CaO, 77; MgO, 4·5; SiO_2, 5·6; P_2O_5, 8·2 per cent (error ± 10–20 per cent)} was decalcified rapidly (in less than 15 min.) on treatment with excess ethylenediaminetetra-acetic acid at *p*H 9. No carbohydrate material was extracted in this process. After a further treatment with ethylenediaminetetra-acetic acid at *p*H 3, the residue was extracted with ethanol (pigment removal) and ether (lipoid removal). The chitin (*A*) so obtained was an off-white colour {ash (as oxide), 2·6 per cent; spectrographic analysis: SiO_2, 107; MgO, 0·08 per cent (error ± 10–20 per cent)}. Found (corrected for ash in parentheses): C, 42·3 (43·5); H, 6·4 (6·6); N, 7·4 (7·6). Calculated for $(C_8H_{13}O_5N)_n$: C, 47·3; H, 6·4; N, 6·9 per cent. That chitin *A* contained protein was demonstrated by hydrolysis (6 *N* hydrochloric acid for 24 hr.) followed by paper electrophoretic separation[3] of the hydrolysate components in acetate buffer (pH 5). Acidic (glutamic and aspartic acids) and neutral amino-acids separated into compact zones detectable with ninhydrin. D-Glucosamine and the basic amino-acids were located in the same zone. Determination of the protein content of chitin preparations proved difficult but appeared to be less than about 5 per cent. A comparison of the protein content of the various chitin preparations was achieved by visual inspection of the acidic amino-acid zone detected by ninhydrin after paper electrophoresis.

The protein in chitin *A* could not be removed by extraction at room temperature with dimethylformamide or a phenol – water (9 : 1) mixture. Extraction with 98–100 per cent formic acid (cf. Schulze and Kunike[3]) gave soluble chitin *B* {69 per cent; ash (as oxide), 0·8 per cent; $[\alpha]_D$ 0 ± 2°} and insoluble chitin *C* {31 per cent; ash (as oxide), 4·8 per cent}. Both fractions apparently had the same protein content, but some evidence was obtained which suggests that formylation may have occurred during the extraction. The fraction soluble in formic acid was precipitated by the addition of an equal volume of water.

Chitin *A* was almost completely dispersed in aqueous lithium thiocyanate[4] (saturated at room temperature) at 95–100° to give chitin *D* ($[\alpha]_D$ – 24 ± 5°). Progressive dilution of the extract with acetone gave a series of chitin fractions which, expressed as a percentage of original chitin in solution with acetone percentage in parentheses, were *E*, 77 per cent (50); *F*, 11 per cent (75); *G*, 11 per cent (90). The protein content of these fractions was similar. Fractionations of chitin *A* were also achieved using dilute solutions of lithium thiocyanate and/or lower extraction temperatures. The protein content of all these fractions appeared to be similar. In no case was a protein-free chitin fraction obtained.

The protein content of chitin *A* could be substantially reduced but not completely eliminated by repeated extraction with hot alkali (cf. Hackman[1]) to give chitin *H*.

The above observations strongly suggest that the protein in chitin *A* is bound chemically to the mucopolysaccharide. There has been speculation[5] in the literature concerning the existence in the arthropod cuticle of a glycoprotein, and in the case of *Cancer pagurus* this would appear to be so. Also indicated by the above fractionations is the polydisperse nature of chitin *A*. In this connexion it would be of interest to determine the molecular weight of the various fractions described above and, now that solvents for chitin are available, methods such as that devised by Isbell *et al.*[6] theoretically should be applicable. This aspect is being further examined, as is the precise nature of the protein–chitin linkage.

The close general similarity of the infra-red spectra[7] of chitin *A* and the almost protein-free chitin *H* suggests a close structural relationship between them and, further, indicates a protein content of less than 5 per cent in chitin *A*. It should be emphasized that a very small amount of de-N-acetylation and/or fragmentation in converting chitin *A* into chitin *H* would not easily be detected in the infra-red spectra.

Full experimental details of this investigation will be published in due course.

We thank Prof. M. Stacey for his interest, Dr. S. A. Barker and Dr. T. S. West for helpful discussion, Dr. D. H. Whiffen for the infra-red measurements, Dr. J. R. Majer for the particle-size determination and Mr. R. F. Hourigan and Dr. J. H. Thompson for the spectrographic analyses.

Two New Bacteriophages for Bacterial Pathogens of the Bean

THE bacterial pathogens of beans are widespread all over the world. In most cases four species of bacterium are the main causal organisms: *Pseudomonas phaseolicola* (Burkholder) Dowson, *Xanthomonas phaseoli* (E. F. Smith) Dowson, *Corynebacterium flaccumfaciens* (Hedges) Dowson, and *Xanthomonas phaseoli* var. *fuscans* (Burkholder) Starr et Burkholder. The symptoms, on the seed, of the diseases caused by these four bacteria are similar to such an extent that they can be identified only by means of laboratory methods. Katznelson *et al.*[1] succeeded in isolating the phages for *P. phaseolicola* and *X. phaseoli*. The Canadian authors worked out a rapid phage-count method using these two phages. By means of this procedure they were able to detect the halo-blight organism (*P. phaseolicola*) and the common blight bacterium (*X. phaseoli*) in beans. In order to apply this method for all the four important pathogens of beans, it was necessary to isolate also the phages for *C. flaccumfaciens* and *X. phaseoli* var. *fuscans*. This work, which was undertaken because *C. flaccumfaciens* and *X. phaseoli* var. *fuscans* are the major causative agents of bean diseases in Hungary, was recently carried out in our laboratory.

We have isolated specific phages for both *C. flaccumfaciens* and *X. phaseoli* var. *fuscans* from naturally infected bean seeds. The ground seeds were suspended in nutrient broth and were inoculated with the host cells susceptible to the phages to be tested. After an incubation period of 48 hr. at room temperature, the samples were centrifuged and filtered through Seitz pads. The active filtrate was passed five to seven times until we obtained typical plaques on nutrient broth agar.

The plaques of phage for *C. flaccumfaciens* could be seen after 10–12 hr. at 28° C. On 0·75 per cent agar medium (glucose-broth-agar) the phage forms clear, circular plaques of 1–2 mm. in diameter, with entire margins.

The plaques of the phage for *X. phaseoli* var. *fuscans* appeared after 20–24 hr. They are larger than those of the other phage mentioned above (3–4 mm. in diameter), are clear, round and have entire margins.

Both phages were tested for specificity against a variety of strains of their homologous organisms, as well as of other species. These results are reported in Table 1.

Table 1. SPECIFICITY OF PHAGES FOR *C. flaccumfaciens* AND *X. phaseoli* VAR. *fuscans*

Organisms tested	Phage for	
	C. flaccumfaciens	*X. phaseoli* v. *fuscans*
C. flaccumfaciens (B629)	+	−
(and 24 strains of it)	+	−
P. phaseolicola	−	−
X. phaseoli (from Germany)	−	−
X. phaseoli (from England)	−	−
X. phaseoli var. *fuscans* (B736)	−	+
(and 4 strains of it)	−	+
X. carotae	−	−
X. malvacearum	−	−
X. uredovorus	−	−

It can be seen that the phage for *X. phaseoli* var. *fuscans* is highly specific, since it does not lyse the closely related *X. phaseoli*.

This work shows that if we have the phages for all the four important bacterial pathogens of bean, the method described by Katznelson *et al.* may be applied in its entirety.

Detailed accounts of this work will be published elsewhere.

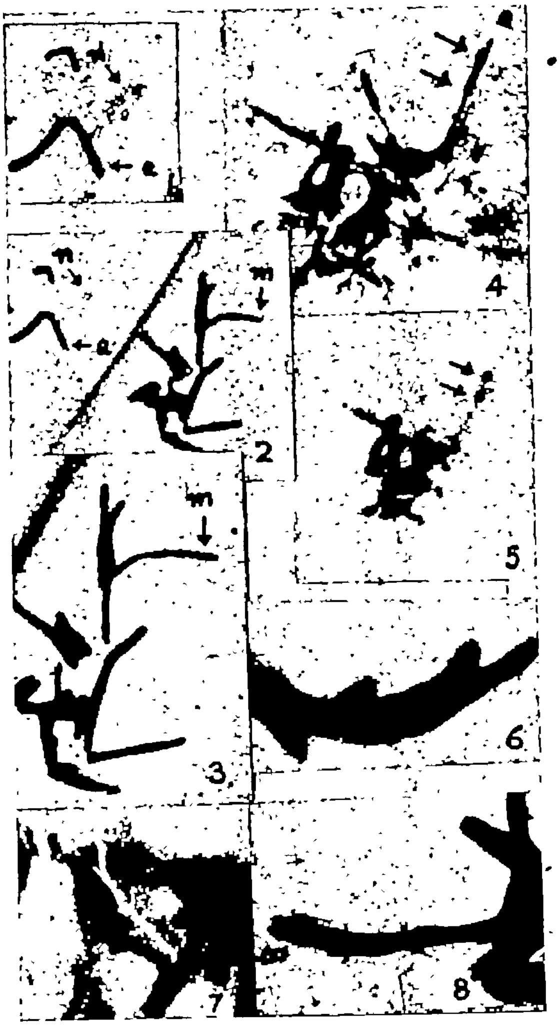
Morphological Changes of Tubercle Bacilli caused by Staining Procedures

WE have studied with the electron microscope the morphological changes of tubercle bacilli caused by Ziehl-Neelsen's and Fontes' stainings. *BCG* was stained on the specimen-holders by these methods and photographed with the light microscope, using the volatile anisol immersion-system; the same bacilli were photographed again with the electron microscope. A similar method has been used by Takeya *et al.*[1] and Glauert and Brieger[2] in other staining procedures.

The acid-fast bacilli prove to be narrow shrunken cellular bodies having high electron density and no visible internal structures (Fig. 1, *a*). There is a non-acid-fast form of tubercle bacillus which is a ghost cell consisting of only a cell wall (Fig. 1, *n*), and its electron-scattering power is lowest of all the cells. There is also a small non-acid-fast form of tubercle bacillus which has somewhat higher electron density. The cytoplasm of the moderately acid-fast form of the tubercle bacillus has low electron density and is torn to small pieces (Fig. 3, *m*). According to these findings, the electron density of tubercle bacilli is considered to be related in some way to acid-fastness. In fact, extraction of lipid decreases the electron density and the acid-fastness. The bacilli stained by Fontes' method are found to be slender shrunken cells having oval dense granules, which are larger than the width of the cells and are irregularly bounded (Figs. 4, 5). No electron-dense granules are found in these stained bacilli, although such granules are observed in 73 per cent of the cells before the staining.

We have also investigated some possible causes of these changes. Neither the fixative (90 per cent alcohol), dye solvent (alcohol) nor decolorizing agents (3 per cent hydrochloric acid–alcohol or acetone–alcohol (1 : 1) and Lugol's solution) has any conspicuous influence upon the configuration and the electron density of the bacilli in the conditions of usual staining procedures. According to Glauert and Brieger[2], the staining of *Mycobacterium phlei* with Giemsa increases the electron density. A large amount of dye deposited on the bacilli is considered to increase their electron density. The increased electron density of *BCG* stained with 10 per cent alcoholic solution of fuchsin at room temperature for 48 hr. (Figs. 6, 7) is lower than that of *BCG* treated with 5 per cent carbol for 10 min. at room temperature. Moreover, the carbol treatment causes the bacillary cytoplasm to contract and the electron-dense granules to disappear. The configuration and electron density of the bacilli treated with 5 per cent carbol show a close resemblance to those of the bacilli stained by Ziehl-Neelsen's method (Fig. 8). The intensity of the changes is parallel with the degree of heating. In each change the carbol content of these stains may be considered to play a greater part



(1) Acid-fast (*a*) and non-acid-fast (*n*) *BCG*. × 5,300. (2) Photomicrograph of the same bacilli as in Figs. 1 and 3. × 2,600. (3) Moderately acid-fast *BCG* (*m*). × 5,300. (4) Electron micrograph of the same bacilli as in Fig. 5. × 3,000. (5) Photomicrograph of *BCG* stained by Fontes' method. × 2,700. (6) *BCG*. × 8,400. (7) *BCG* stained with alcohol solution of fuchsin. × 8,100. (8) *BCG* treated with 5 per cent carbol. ×10,700

However, in the increase of the electron density of the bacilli stained by Ziehl-Neelsen's method, other factors, such as the stain and the lipid material, should be taken into consideration.

In short, in the staining procedures of Ziehl-Neelsen's and Fontes' methods, most of the cells of *BCG* contract and their electron density increases though the electron-dense granules disappear. Accordingly, the granules detected in the specimens stained by these methods are different from the electron-dense granules, which are considered to occur naturally. The carbol of the stains which are used is among the causes of these changes.

We thank Profs. Hibi and Kuroya, of Tôhoku University, for their assistance, and Dr. E. M. Brieger, Strangeways Research Laboratory, Cambridge, for his instructive comments.

Lysis of *Vibrio cholerae* by Thymol

CULTURES of *Vibrio cholerae* are very sensitive to thymol. The addition of 50 mgm. of this substance to 10 ml. of 4-hr. broth cultures results in rapid clearing due to massive lysis of the organisms. This takes about 30–45 min. at 37° C., by which time the cultures are sterile. As thymol is soluble in aqueous media only to the extent of 1 in 1,500, the effective concentration required to lyse *V. cholerae* may be of this order. The rapidity with which this occurs simulates the phenomenon of 'induction' observed in certain lysogenic bacteria, when they are exposed to ultra-violet radiation or X-rays or treated with chemical mutagens. However, lysogenic cultures of *V. cholerae* exposed to thymol do not reveal any appreciable increase in free phage particles in the lysates. Further, 'indicator' strains which have proved useful in the detection of lysogenic strains and which appear to be non-lysogenic themselves are lysed equally effectively by thymol.

Other phenols such as catechol, resorcinol, menthol and carbolic acid do not lyse these cultures to a perceptible degree in such a short time. Of these, only carbolic acid is lethal to *V. cholerae*. It is possible that thymol, by virtue of its low toxicity and marked vibriolytic activity, may be useful in clinical and laboratory studies on cholera.

Fomes lignosus, a Pyrimidine-deficient Fungus

THE growth requirements of a number of brown-root and white-root disease fungi have already been studied. It is generally recognized that the majority of the Hymenomycetes are partially or totally deficient in thiamine (aneurin, vitamin B_1)[1].

So far as can be ascertained from the literature available, one of the most important root disease fungi, especially of tropical plants, *Fomes lignosus* (Klot.) Heim ex. Pat., has not so far been investigated in this respect[2]. Attempts to grow *Fomes lignosus* on artificial media, as those of Czapek, Fries, Richard and Knop[3], have been unsuccessful. However, as soon as organic materials such as malt extract, yeast extract or decoctions of fresh rubber wood or of rubber leaves were added, luxuriant growth of the fungus occurred, and, in the culture flasks, the well-known rhizomorphs were formed.

Table 1. *p*H AND MYCELIUM (DRY WEIGHT IN MGM.) OF *Fomes lignosus* ON KNOP-GLUCOSE MEDIUM WITH AND WITHOUT ASPARAGINE, THIAMINE, THIAZOLE AND PYRIMIDINE AFTER 28 DAYS AT 27° C.

Culture medium	*p*H of culture medium At beginning	 At end	Mycelium per flask (dry weight in mgm.)
Knop + 10 gm./l. glucose	5·0	4·8	1·5
Knop + 10 gm./l. glucose + 1 gm./l. asparagine	5·0	4·8	2·0
Knop + 10 gm./l. glucose + 0·5 mgm./l. thiamine	5·0	4·8	1·3
Knop + 10 gm./l. glucose + 0·5 mgm./l. thiazole	5·0	4·8	2·0
Knop + 10 gm./l. glucose + 1 gm./l. asparagine + 0·5 mgm./l. thiamine	4·9	4·2	331·5
Knop + 10 gm./l. glucose + 1 gm./l. asparagine + 0·5 mgm./l. pyrimidine	4·9	4·2	326·0
Knop + 10 gm./l. glucose + 1 gm./l. asparagine + 0·5 mgm./l. thiazole	5·0	4·8	2·0
Knop + 10 gm./l. glucose + 1 gm./l. asparagine + 0·5 mgm./l. thiazole + 0·5 mgm./l. pyrimidine	5·0	4·2	323·8
Knop + 10 gm./l. glucose + 1 gm./l. malt extract	4·9	4·1	251·2
Knop + 10 gm./l. glucose + 1 gm./l. yeast extract	4·9	8·3	334·8

The experiments were carried out in 500-ml. 'Jena' Erlenmeyer flasks. Each series consisted of ten flasks, and each flask contained 100 ml. of the liquid culture medium. All experiments were replicated three times. The chemicals used were of the "pro analysis" grade (Merck) or the special "Biochemicals" of Hoffmann–La-Roche.

To obtain a uniform inoculum for these experiments the fungus was grown in advance for 42 days on pieces of fresh rubber wood, and a mycelium suspension was prepared by adding 100 ml. of sterile distilled water and vigorously shaking the culture flasks. Preculturing the fungus on small pieces of wood was advantageous compared with preculturing on a rice or liquid medium. The Erlenmeyer flasks were inoculated by the wet method, each flask with 0·5 ml. of the mycelium suspension, and the cultures were incubated at 27° C. Knop solution containing 10 gm./l. of vitamin-free glucose was used as basic medium for these experiments. The results of the experiments are presented in Table 1.

Fomes lignosus is a fungus which is unable to synthesize the whole thiamine (thiamine hydrochloride, $C_{12}H_{17}ON_4SCl.HCl$) molecule. It can synthesize only one part, thiazole (4-methyl-5-(β-oxyethyl)-thiazole, C_6H_9ONS); the other part, pyrimidine (2-methyl-4-amino-5-aminomethyl-pyrimidine-dihydrochloride, $C_6H_{12}N_4.2HCl$), must be supplied from other sources.

A further interesting fact brought out in these experiments is that the pure Knop solution with 10 gm./l. glucose and thiamine or pyrimidine is not sufficient for satisfactory growth and that in addition asparagine had to be added. How far asparagine can be replaced by other organic nitrogen sources and how far *Fomes lignosus* can utilize nitrates are questions which are the subject of further studies.

Effects of Nucleic Acids on Larval Growth, Pupation and Adult Emergence of *Pseudosarcophaga affinis* (Fall.)

THE recent report by Brust and Fraenkel[1] that ribonucleic acid inhibits emergence of adults of *Phormia regina* (Mg.) from the pupae prompted an immediate investigation of the effects of this component of the diet of *Pseudosarcophaga affinis* (Fall.) (Diptera: Sarcophagidae).

The experimental methods used and the composition of the chemically defined diet have been described previously[2]. This diet normally contains 0·1 per cent ribonucleic acid, but for this investigation diets were made up that contained 0, 0·025, 0·05, 0·1, 0·2, and 0·4 per cent. Fifty larvæ were reared on each diet, and the experiment was replicated seven times. The ET_{50} (time, measured to nearest day, required for 50 per cent of the larvæ to reach third instar) was determined for each replicate. The percentage of larvae in third instar in each treatment group on the ET_{50} of the particular replicate was observed and noted.

Whether deoxyribonucleic acid is as satisfactory as ribonucleic acid at the 0·1 per cent level was tested in a second series of experiments. Three media were compounded, one containing 0·1 per cent ribonucleic acid, one containing 0·05 per cent ribonucleic acid + 0·05 per cent deoxyribonucleic acid, and one containing 0·1 per cent deoxyribonucleic acid. One hundred larvæ were reared on each diet, and the experiment was repeated three times.

Each result in Table 1 represents the mean of seven observations. This table shows that growth, pupation, and emergence of adults did occur without ribonucleic acid in the diet and that the addition of ribonucleic acid had little or no effect on pupation. Adding up to 0·1 per cent ribonucleic acid improved larval growth ($P < 0·01$), an effect previously observed with *Drosophila melanogaster* Mg.[3,4], the housefly, *Musca domestica* L.[5], and *P. affinis*[6], but not with *Phormia regina* (Mg.)[1]. However, with more than 0·05 per cent ribonucleic acid in the diet, fewer adults emerged ($P < 0·01$), and the observation of Brust and Fraenkel[1] is confirmed, but only concerning the effect of dietary levels of ribonucleic acid greater than 0·05 per cent.

Table 1. EFFECTS OF RIBONUCLEIC ACID ON LARVAL GROWTH, PUPATION AND ADULT EMERGENCE OF *Pseudosarcophaga affinis* (FALL.)

Diet No.	Percentage RNA in diet	Percentage larvæ in third instar at ET_{50} for replicate*	Percentage of larvæ pupating	Percentage of pupæ producing adults†
1	0	6·9	72·5	30·7
2	0·025	42·1	83·4	32·5
3	0·05	59·0	84·6	41·0
4	0·1	70·9	83·1	26·1
5	0·2	71·5	83·3	19·2
6	0·4	69·8	80·0	16·9

* Larval growth on diets 1, 2 and 3 significantly slower than on diets 4, 5 and 6 ($P < 0·01$).
† Adult emergence on diets 4, 5 and 6 significantly less than on diets 1, 2 and 3 ($P < 0·01$).

The second series of experiments indicated that deoxyribonucleic acid was equivalent to ribonucleic acid for this insect (F value < 1) in its effect on larval growth, pupation, and emergence of adults. Thus *P. affinis* differs from *Phormia regina*, in which deoxyribonucleic acid promotes pupation[1], and from *D. melanogaster*, in which it is not equivalent to ribonucleic acid[4] or may even have a deleterious effect on development[3].

As a result of these experiments, 0·075 per cent ribonucleic acid will be used in future diets for *P. affinis* to preserve most of the effect on larval growth and yet avoid much of the effect on emergence of adults. The results also demonstrate the importance of having more than one criterion of the adequacy of diets.

Water-Relations and Sporulation of *Peronospora tabacina* Adam.

ALTHOUGH it is generally recognized that high humidities favour sporulation of downy mildews, the review of Yarwood[1] indicates the paucity of quantitative data on this aspect of their development. Armstrong and Sumner[2] reported that, under field-conditions, normal sporulation of *Peronospora tabacina* was limited to the range of humidity from atmospheric saturation to slightly below dew point. Laboratory experiments have been carried out at Canberra to study quantitatively the sporulation of *P. tabacina* as a function of the water relations of its host (*Nicotiana tabacum* L. var. Turkish Sampson) under controlled environmental conditions.

Physiologically similar leaves were detached from uniform glasshouse-grown tobacco plants (mean height, 23 cm.), inoculated with a spore suspension and incubated at 100 per cent relative humidity at 21° C. for five days. Leaf disks (15 mm. diameter) were punched from the infected non-sporulating leaves and transferred, ventral surface upwards, to controlled-environment conditions within sealed Petri dishes incubated at constant temperature (21° C.) and alternating light and dark conditions (photoperiod of 12 hr. at 600 lux, fluorescent light) for 24 hr.

The relative humidity of the atmosphere above the leaf disks was controlled by glycerol–water solutions in Petri dishes. The diffusion pressure deficit of the leaf tissue was adjusted by floating the leaf disks on mannitol solutions contained in

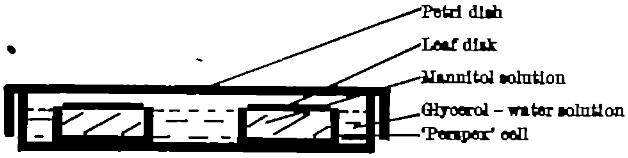

Fig. 1. Micro-environment chamber

'Perspex' cells (15 mm. diameter, 5 mm. deep, Fig. 1) standing in the glycerol–water solutions. Leaf disks were randomized after being punched out. Three leaf disks and 'Perspex' cells were placed in each Petri dish. Six leaf-disk replications were used in all experiments.

Sporulation intensity per unit area of infected leaf was measured by dropping each disk into 0·5 ml. of 50 per cent ethanol in 25-ml. McCartney bottles. The latter were shaken for ½ min. on a 'Microid' shaker and the concentration of the spore suspensions measured by counting standard fields in a hæmocytometer chamber. Results were analysed using the log $(x + 1)$ transformation. The transformed means of the spore concentration counts were plotted against relative humidity or diffusion pressure deficit, and hand-fitted curves drawn (Fig. 2).

Results of experiments studying sporulation as a function of relative humidity with diffusion pressure deficit, temperature and light conditions constant, and sporulation as a function of diffusion pressure deficit with relative humidity, temperature and light conditions constant are presented in Fig. 2. In both experiments a significant difference between treatments ($P < 0·001$) occurred between 2·6 atmos. and 5·1 atmos. diffusion pressure deficit, and between 96 per cent and 97 per cent relative humidity, respectively. Elsewhere differences in sporulation intensity were not significant.

These preliminary results suggest that not only atmospheric humidity but also the diffusion pressure deficit of the host tissues are of critical importance in the sporulation of *P. tabacina*. Either a relative humidity less than 97 per cent or a diffusion pressure deficit greater than 3–4 atmospheres under otherwise favourable environmental conditions significantly reduces sporulation intensity. In this way the external and internal water relations of the host may affect, directly and indirectly respectively, the epidemiology of downy mildew diseases, for under field conditions a reduction in sporulation intensity per unit area of infected leaf reduces the secondary spread of the disease during the growing season.

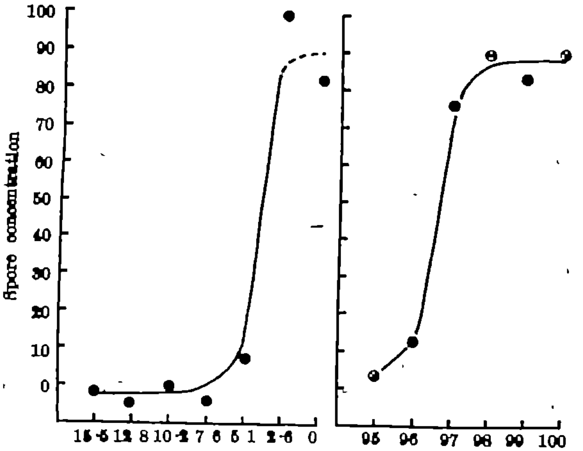

Fig. 2. Relation between diffusion pressure deficit (D.P.D.), relative humidity (R.H.) and sporulation of *P. tabacina*

A full account of this work will be published elsewhere. Thanks are due to Mr. M. L. Dudzinski, Section of Mathematical Statistics, Commonwealth Scientific and Industrial Research Organization, who undertook the statistical analyses of the data.

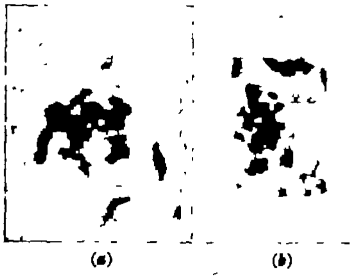
Mitosis in Vegetative Hyphæ of Higher Fungi (Hymenomycetes)

To find out mitotic stages, vegetative hyphæ of an agaric (wild variety of *Psalliota campestris*) and a polypore (*Polyporus cuticularis*), growing in culture on liquid 3 per cent malt medium, were fixed at intervals of half an hour from 2 p.m. to midnight; it was found by these trials that 8 to 8.15 p.m. (at night) was the most suitable period for demonstration of mitotic stages in these two cases under our laboratory conditions (temperatures of 25°–32° C.). A number of fixatives (such as Allen's Bouin, Carnoy, Navashin and Fleming's strong fluid) and stains (iron-hæmatoxylin, gentian violet, aceto-orcein and Feulgen) were used, of which the Fleming's strong fluid preceded by pretreatment in cold (15°–16° C.) for 1½ hr. with aesculin and 1 per cent saponin, and acet-orcein and Feulgen stains were found to be best. The squash technique of applying uniform pressure on the cover-slip readily brought out scattering and clarity of the small chromosomes which can scarcely be expected from the routine method of paraffin block-sectioning.



(a) (b)

Fig. 1. *Psalliota campestris* (wild var.). (a) Late prophase (× 5,000 approx.). (b) Polar view of metaphase (× 3,000 approx.)

Aesculin is a growth-retarding substance, obtained from *Aesculus hippocastanum*. Probably, pretreatment with aesculin and 1 per cent saponin in the cold helps easy penetration of the fixing fluid through the chitinous and complex walls of the higher fungi. The number of chromosomes of the somatic nuclei in *P. campestris* (Fig. 1a and b) seems to be higher ($n = 9$). Colson[1], when studying meiosis in basidia of *P. campestris*, recorded the haploid number of chromosomes for both wild and cultivated forms of *P. campestris* as nine gemini.

Details of the work will be published elsewhere.

An Acetocarmine Squash Technique for the Fucales

ACETOCARMINE techniques have only been used to a limited extent in cytological studies of the Phaeophyta, and only in examination of filamentous forms, or filamentous phases in the life-history of the larger forms. Investigations of the Fucales have relied on techniques of embedding and microtoming, followed by staining with Heidenhain's hæmatoxylin[1] or crystal violet[2].

The chief obstacles to the use of acetocarmine squash techniques in the Fucales are the pigmentation, which may obscure or block the staining, and the nature of the cell wall, which is insufficiently macerated by the acetic acid to allow the necessary degree of squashing. Both these difficulties can be overcome by pretreatment with hydrogen peroxide and sodium carbonate according to the following schedule.

Fixation. Small portions of the material, either apices or receptacles, are fixed for 24 hr. in Karpechenko fixative[3] and then washed thoroughly in water.

Bleaching. Bleaching is carried out immediately after fixation: in all the species examined, 4 hr. in 20 per cent hydrogen peroxide produces a suitable degree of bleaching and also causes a preliminary softening of the cell walls, which helps in the subsequent spreading of the squash. After bleaching, the material is thoroughly washed and then treated with acetocarmine.

Acetocarmine treatment. Hand-sections of the region to be examined are mounted on a filmed slide in a drop of 6 per cent sodium carbonate. This converts any alginate into sodium alginate, and as the preparation is gently warmed, the weight of the coverslip squashes and spreads the section: manual pressure can be applied if further spreading is required.

The preparation is irrigated with distilled water to remove excess sodium carbonate, and then with acetocarmine, after which it is gently boiled until the stain is sufficiently differentiated. It may then be examined as a temporary mount in the acetocarmine, or made permanent by allowing the coverslip to fall off in acetic alcohol, dehydrating and mounting in 'Euparal'.

Storage. If the material is not to be examined immediately after bleaching, it may be stored in acetic alcohol made up of one part of glacial acetic acid to three parts of absolute alcohol, with ferric acetate dissolved in 45 per cent acetic acid added until it is a light amber colour. After rinsing in alcohol to remove excess acetate, acetocarmine squashes can be made as above.

Using this technique, growing apices and developing receptacles of several species of *Fucus* and *Cystoseira*, *Himanthalia elongata* and *Halidrys siliquosa* have been examined, and many stages of division found. Fig. 1*a* shows a metaphase plate in a vegetative cell in the apical groove of *Himanthalia elongata* obtained by this method, and Fig. 1*b* an analysis of this plate made by enlarging the negative to a greater degree, inking in the chromosomes and bleaching the print. This is then checked visually against the preparation. Fig. 1 gives a count of 60 chromosomes. A number of metaphases have been examined in this way and give counts ranging between 56 and 62—a variation possibly due to the fact that many of the chromosomes show separation into chromatids and it is not always possible to distinguish them.

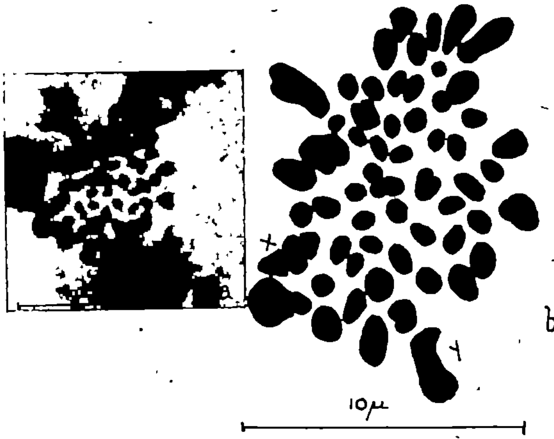

Fig. 1. (*a*) Photomicrograph of a metaphase plate from a cell in the apical groove of *Himanthalia elongata*. (*b*) Analysis of plate shown in (*a*). At *x* one chromosome is at a higher focal level; at *y* the chromosome is scarcely in the focal plane of (*a*)

Thus, by using this technique on actively growing apices and developing conceptacles, nuclear divisions in the Fucales may be obtained with little more trouble involved than in making root-tip squashes or pollen grain smears.

Chromosome Numbers in Some Members of the Ulotrichales

CHROMOSOME numbers in three species of *Uronema* were reported earlier by me[1]. Subsequent study of the mitotic divisions in some other members of the Ulotrichales resulted in establishing the chromosome numbers as listed below.

		Previous counts
**Uronema terrestre* Mitra	$n = 16$	—
Microspora amoena (Kütz.) Rabenh.	$n = 22$	$n = 8$–12 (Neuenstein, ref. 2)
**Microspora* sp.	$n = 18$	—
Ulothrix zonata Kutz.	$n = 10$	$n = 4$ (Schussnig, ref. 3, Gross, ref. 4)
**Ulothrix subtilissima* Rabenh.	$n = 14$	—
**Sphaeroplea annulina* (Roth) Ag.	$n = 16$	—

The chromosome number for *Sphaeroplea annulina* given above is the first record for the genus. Among other species of *Microspora* and *Ulothrix*, Cholnoky[5] recorded $n = 8$–10 for *M. stagnorum* and $n = 7$–8 for *U. variabilis*, and Lind[6] gave $n = 5$ for *U. rorida*. It is noteworthy that the numbers given here for *M. amoena* and *U. zonata* do not confirm the earlier findings. The extremely small size of the chromosomes in most members of the Ulotrichales is probably the reason for the lack of any extensive cytological work on the group.

The materials indicated by an asterisk in the above list were obtained from the Cambridge Culture Collection of Algae and Protozoa. The materials of *M. amoena* and *U. sonata* were collected from Wise Een Tarn and Lake Windermere respectively. Detailed accounts of mitosis in the above forms will be published elsewhere.

A Non-Destructive Method of detecting Diseases in Wood

Ultrasonic equipment has been used by the Timber Development Association for detecting flaws in wood, and its possible development for determining the presence of diseased tissues has been suggested[1]. The principle of this type of flaw detection is to generate pressure (sound) waves of very high frequency which are transmitted through suspect materials such as metals or plastics. When flaws are present, the reduction of the degree of transmission in the defective area can be measured. Ultrasonic waves produced by commercial flaw detectors do not harm the materials being tested. The equipment is portable.

In these trials transmission of ultrasonic energy through wood was measured both down and across the grain. After two areas, on exactly opposite sides of the samples, had been smoothed to give two flat surfaces, each about 25 sq. cm. in area, the wood was smeared with a coupling agent to ensure good contact between the probes and the wood. To transmit across the grain the sampling areas had to be stripped of bark, which was found to be impenetrable to the ultrasonic energies employed.

The transmission of ultrasonic energy through wood is considerably reduced even when slight defects are present (Table 1). The sensitivity could probably be increased with sets specially adapted for detecting flaws in timber. No transmission could be obtained through 5 cm. of red pine infected with dry rot even though ultrasonic energy could be transmitted through 130 cm. of sound seasoned beech.

Besides its potential value as a research tool for studying the ecology of tree disease organisms, the most important development of this technique would be the reduction of economic losses of timber. Trees of value are often lost because fungal infections (such as heart and butt rots) remain undetected for many years. The early detection of disease in a plantation would enable a decision to be made about its potential value and future management. Loss on imports or timber in storage could be reduced if a speedy method of detecting incipient decay in bulk timber were available.

We should like to express our thanks to the Atomic Energy Research Establishment, Harwell, and to Messrs. Kelvin Hughes for permission to use equipment at their laboratories; to Mr. E. Skippen, of A.E.R.E., for his advice and assistance; and to Mr. Abel Ward for allowing us to take samples from Eggerslack, Grange-over-Sands.

Table 1. Relative Transmission of Ultrasonic Energy through Samples of Wood

Direction of transmission	Flaw detector	Frequency (megacycles)	Transducer	Coupling agent	Percentage transmission through sound wood*					
					Birch†			Oak†		
					Sound wood	Wood infected by *Polyporus betulinus*		Sound wood	Sound wood with hole ¼ in. diameter drilled longitudinally	Brittle wood with pockets of rot
						Central rot 32 per cent by vol.	Completely rotten			
Across grain	Kelvin Hughes Mark V	¼	Quartz	'Polycel'	100	0	0	—	—	—
	Kelvin Hughes Mark V	¼	Barium titanate‡	'Vaseline'	100	20	0	100	10	50
	Kraut Kramer Mark IX	½	Barium titanate‡	'Polycel'	100	17–33	0	100	3–23	12–27
Down grain	Kelvin Hughes Mark V	¼	Quartz	'Polycel'	100	38	0	—	—	—
	Kelvin Hughes Mark V	¼	Barium titanate‡	'Vaseline'	100	10	0	100	—	15
	Kraut Kramer Mark IX	½	Barium titanate‡	'Polycel'	—	—	—	100	—	55

* Absolute values are not shown as machines were not calibrated and scale values recorded were peculiar to each machine, so values obtained by the individual machines are not comparable.

† Dimensions of samples were approximately 9 cm. wide by 20 cm. long. Samples were obtained from standing trees five days before testing and were preserved by smearing 'Vaseline' on all cut surfaces, then sealed into polythene bags.

‡ Machine not tuned, so efficiency was about 5 per cent.

Eels in Southern Africa

Sponsored by the South African Council for Industrial and Scientific Research, this Department, under the direction of Prof. J. L. B. Smith, is undertaking the study of the life-history of the freshwater eels of the western Indian Ocean. Most authorities have hitherto held that only one species of freshwater eel, namely, *Anguilla mossambica* Peters, occurs in South Africa. Ege[1] recorded a specimen of *Anguilla* *marmorata* Quoy and Gaimard, from the Buffalo River, Eastern Cape (27° 30′ E., 32° 57′ S.), but as this was the only one from the continent of Africa its validity has been queried. However, among the eels in this Department and of the Kaffrarian Museum, Kingwilliamstown, we have found six, all females, with pleated gonads full of ova, which are unquestionably *Anguilla marmorata* Quoy and Gaimard. Three of these, 85–135 cm. in length, are from the Keiskama River (27° 13′ E., 33° 03′ S.) (near the Buffalo), and the remainder, 73–108 cm. in length, from the confluence of the Sabi and Lundi Rivers in Southern Rhodesia (32° 25′ E., 21° 10′ S.). In both cases the habitats are mature rivers below the 1,000-ft. contour.

At night, during February and March 1957, upstream migrations of thousands of young eels, at all sizes from 10 to 22 cm., were observed in the Buffalo (27° 30′ E., 32° 57′ S.) and the Kariega Rivers (26° 30′ E., 33° 23′ S.). In samplings taken at this time from the Laing Dam wall on the Buffalo River (27° 30′ E., 32° 57′ S.) three species are present, about 85 per cent being *Anguilla mossambica* Peters. Two specimens, 21·5 and 14·5 cm. in length, are *Anguilla bicolor bicolor* McClelland and the remainder *Anguilla marmorata*. Those from the Kariega River were all *Anguilla mossambica*. A fourth species, *Anguilla nebulosa labiata* Peters, the biology of which has been studied and described in much detail by Dr. Winifred Frost[2], has not yet been found in these southerly rivers.

It is unfortunate that the discovery of *Anguilla marmorata*, in the rivers mentioned above, was made too late to be included in the interesting communication by Dr. W. E. Frost in *Nature* of March 16[3].

Dirt Removal from Cotton

In the course of investigations into detergency using radioactive isotopes, some interesting observations have been made. The chopped fibre technique[1] was used, and the cotton fibre was soiled as described previously[2], but with a proportion of the stearic acid replaced by stearic acid-1-^{14}C. The rate of removal of stearic acid from the fibre after washing with different detergent solutions for various times was measured by the residual activity of the fibre compared with the initial activity of the unwashed fibre. The fibre was made into smooth pads and activities were determined by an end-window counter.

It was found that the relative efficiencies of the detergents as estimated by the removal of the stearic acid and by that of the pigment (graphite) component of the soiling mixture determined by reflectance measurements showed marked similarities, as illustrated in Fig. 1. In addition, although excess of a strong alkali, sodium metasilicate, was present in all detergent solutions, the removal of the stearic acid depended partly upon the detergent used.

This work is being continued employing different fibres and with each type of fatty component of the soiling mixture labelled in turn with carbon-14.

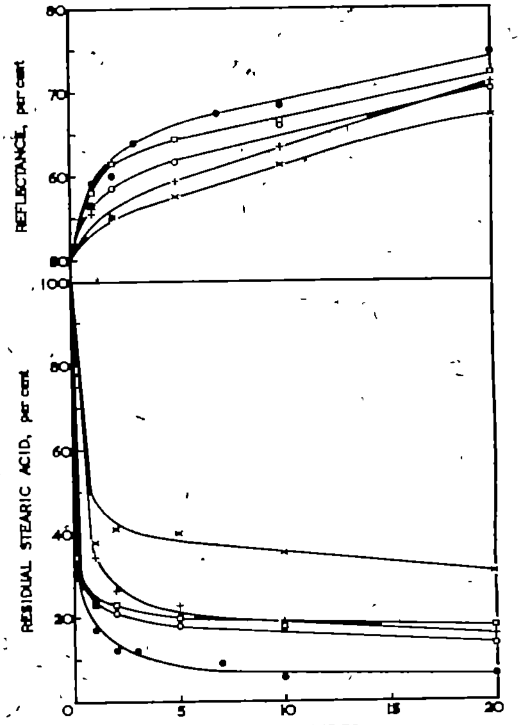

Fig. 1. Removal of radioactive stearic acid and of graphite from cotton. ● + ○ □, 0·1 per cent of detergents plus 0·15 per cent of sodium metasilicate; ×, 0·15 per cent of sodium metasilicate only

We thank Miss J. C. Gracie for technical assistance, the Isotope Division of the Atomic Energy Research Establishment, Harwell, for helpful advice, and the Director and Council of the British Launderers' Research Association for permission to submit this communication for publication.

Organo-Clay Complexes

It has been shown by X-ray analysis that certain organic compounds are taken up between the basal surfaces of montmorillonite and halloysite to form interlamellar complexes. The space occupied by the organic molecules is determined by subtracting the van der Waals thickness of individual clay sheets from the observed (001) spacing, and is normally less than that calculated by assuming that the molecules lie as flat as possible and also make van der Waals contact with the surface atoms of the clay. The apparent reduction in thickness has been ascribed to CH . . . O bonds[1–4] between the oxygen atoms of the clay surface, which have an induced negative charge arising from the isomorphous replacement charge, and the organic molecules. Polyvinyl alcohol, the crysta structure of which has been determined, appears to form a two-layer complex with montmorillonite in which there is van der Waals contact between the —CH_2 groups and the surface oxygen atoms, and the plane of the carbon chains is perpendicular to the (001)

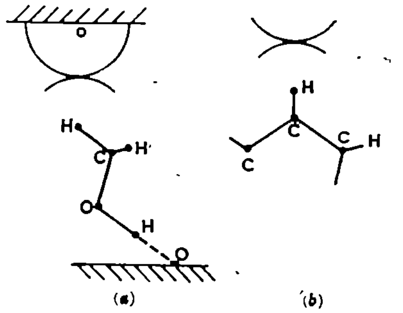

Fig. 1. (a) Methanol on montmorillonite; (b) higher alcohols on montmorillonite

planes (unpublished work). This suggested that the orientation of the simple alcohols might be such that the plane of the carbon chain is perpendicular to the (001) plane, and not parallel as originally assumed[1,3,4]. The most recent evidence is also against the latter assumption[5].

To account for the observed thickness of the intercalated molecules on this hypothesis, some shortening of the van der Waals contact between the organic molecule and the clay surface is still necessary. It seemed unlikely, both from the result with polyvinyl alcohol and on general chemical grounds, that CH . . . O bonds could be formed; OH . . . O bonds would be more likely, as alcohols are known to form intermolecular bonds in this way in the liquid state.

If an oxygen atom is to form a hydrogen bond with another oxygen atom on the clay surface, two conditions have to be satisfied. The OH . . . O bond must be linear and, more specifically, if the clay oxygen atom is already linked by two bonds at the tetrahedral angle to other atoms in the clay, then the hydrogen bonds would be expected to form at the remaining tetrahedral angles, as in the ice structure, for example. This latter condition is met exactly on both surfaces of montmorillonite crystals, where each oxygen atom is linked by tetrahedral bonds to two silicon atoms, and similarly on one surface of halloysite crystals also. On the other surface of halloysite crystals, each hydroxyl is linked to two aluminium atoms by bonds at 90°, so that conditions are not favourable for hydrogen bonding.

Fig. 1a shows the proposed orientation of the methanol montmorillonite complex with the OH . . . O bond at the tetrahedral angle to the clay oxygen atom on one of the clay surfaces. On the other clay oxygen surface van der Waals contact is assumed with the methyl group, with allowance for ree rotation of the group. This will give the maximum observable (001) spacing, namely,

OHO cos 54·73 + CO cos 15·79 + CH cos 54·73
+ van der Waals radius H + van der Waals radius O
+ thickness of silicate sheet (from one plane oxygens to another)
= 2·6 cos 54·73 + 1·43 cos 15·79 + 1·07 cos 54·73 + 1·2 + 1·4 + 6·6 = 12·7 A.

The values of the bond-lengths and van der Waals adii are those given by Pauling[6]. The length of the H . . . O bond is uncertain within 0·1 A.

For halloysite an identical arrangement is possible ith the —CH_3 group making van der Waals conact with the hydroxyl layer. The (001) spacing xpected would then be:

12·7 − 6·6 + 4·4 = 10·5 A.

The increase in spacing to be expected with the higher alcohols in montmorillonite will be (Fig. 1b):

(CC − CH) cos 54·73 + CH cos 54·73
= 1·54 cos 54·73 = 0·89 A., that is, a total (001) spacing of 13·6 A.

For the corresponding amines, methylamine, etc., NH . . . O bonds would be substituted for OH . . . O bonds.

There is some variation among the observed spacings. Glaeser's[7] value of 12·1 A. for the one-layer methanol montmorillonite complex appears to be low, due to incomplete absorption; MacEwan[2] found 10·6 A. for the corresponding methanol halloysite complex, and other workers[1,4] 12·7 A. for the methylamine montmorillonite complex. Glaeser's value for 1-propanol to 1-pentanol on montmorillonite is 13·6 A., the same as MacEwan's value for 1-hexanol, 1-heptanol and secondary alcohols. The corresponding amine complexes give[1,4] spacings of 13·5 A. The general agreement with the calculated values is encouraging.

Evidence relating to the Earth's Inner Core from Hydrogen Bomb Explosions in 1954

In an analysis[1] of seismological readings of four hydrogen bomb explosions carried out by the United States in 1954, we discerned a pattern from which we have surmised the origin-times to an accuracy which we think is of the order of 0·2 sec.

Assuming our surmise to be correct, it emerges that stations in the range 137° $< \Delta <$ 142°, where Δ denotes the epicentral distance, have recorded wave movements from the bombs at times up to 12 sec. before the expected arrival-times. Furthermore, the early movements were found to be followed usually by a second larger phase the times of which agreed within 2 sec. with the expected arrival-times of the phase *PKIKP*. The obvious interpretation of the early readings is that they correspond to diffracted waves arriving at distances short of the *PKP* travel-time cusp at 142°.

A search for diffracted *PKP* waves from natural earthquakes was also made. But while it is likely that there are a number of authentic observations of these waves, epicentral and origin-time uncertainties make it impossible to approach the precision of the inference derived using the hydrogen bomb data. Special significance is attached to the latter, since bomb explosions can permit the precise calculation of travel-times.

The results, which will be presented in detail elsewhere, have an important bearing on the evidence for the existence of the Earth's inner core. Prior to Lehmann's work[2] in 1936, the travel-time branch curve now known as *PKIKP* had been attributed to diffraction effects. It is innate in the calculation of Jeffreys[3] which showed that the readings relating to *PKIKP* could not be attributed to diffraction, that genuine diffracted *PKP* waves should nevertheless be observable. The present investigation gives evidence of the existence of these diffracted *PKP* waves, and at times up to 12 sec. before the *PKIKP* waves arrive. Thus supplementary proof is given of the fact that the phase *PKIKP* is unconnected with diffraction, and therefore connected with the presence of an inner core.

The present communication incidentally illustrates the potential value of nuclear explosions to seismological research.

Detection of Inhomogeneities in Transparent Plastic Sheet by a Simple Schlieren Technique

Transparent plastic sheet and film of most types of polymer respond well to the Schlieren technique, and this method can be used to obtain magnified images of inhomogeneities in the material which are normally not detectable by visual inspection. A very simple method based on the Schlieren principle has been developed which requires only an ordinary slide projector and a clean-cut square piece of an opaque material such as cardboard or thin sheet metal the size of which should be somewhat larger than that of the front lens of the projector.

The specimen under investigation is mounted on the slide carrier without cover glasses and projected on to a screen at the desired magnification. The Schlieren effect is produced by partially covering the front lens of the projector with the opaque sheet. Inhomogeneities such as flow lines or particles of different density then become visible on the screen in the form of high-contrast magnified images.

The opaque sheet should be held as close as possible to the front lens. Where the front lens is recessed or hooded, it is advisable to remove the projecting rim. In some cases it will be found advantageous to stop down the light by placing an aperture in front of the condenser lens. The position of the sheet with respect to both the degree of lens coverage and the angular direction of the traversing edge at which maximum contrast is obtained depends on the physical and optical properties of the specimen as well as on the type of projector used, and is best found by trial. For plastic sheet and film, which are usually anisotropic, the optimum position of the edge is at right-angles to the direction of orientation of the specimen.

The effect of this method is shown in the accompanying photographs, which have been taken by placing a photographic plate (Kodak *B* 4) in the position of the screen. In Fig. 1, (*a*) is the image of a cellulose acetate film which was extruded from a non-homogeneous melt, as it appears on the screen on 'straight' projection; (*b*) shows the appearance of the same area of film with the opaque sheet in position; (*c*) and (*d*) are Schlieren pictures of disturbances in similar cellulosic materials due to incorrect manufacturing conditions. The diamond pattern of the flow lines in (*d*) indicates 'cold flow' due to low production temperature. Fig. 2 is a typical image of polythene film. All reproductions are × 20.

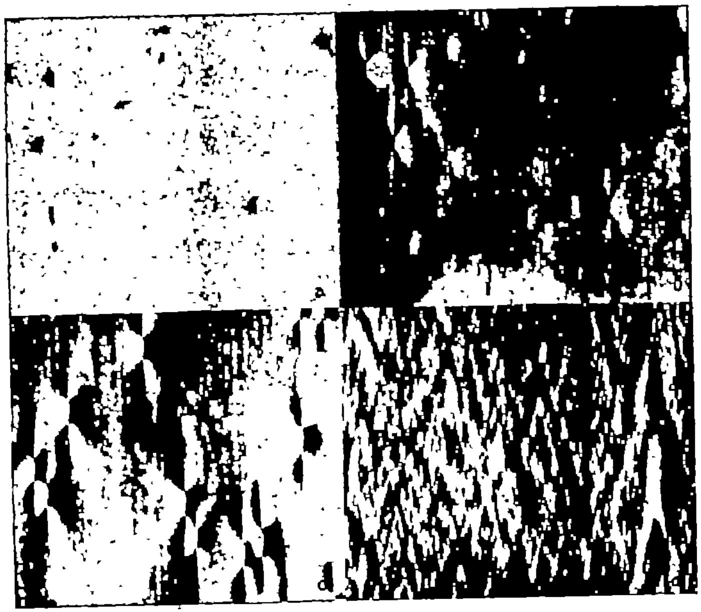

Fig. 1

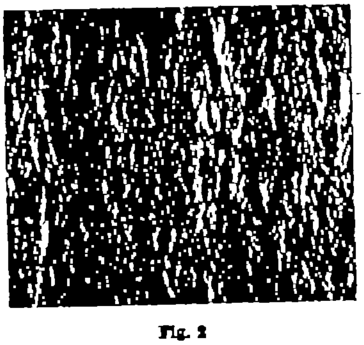

Fig. 2

In all cases, the pattern revealed by the Schlieren method was not, or only faintly, recognizable on inspection in transmitted or reflected light. A study of the various patterns can supply useful information about the manufacturing history as well as some rheological properties of the plastic, and has been used for identifying different materials.

Alternatively, the opaque sheet may be replaced by a sheet of 'Polaroid', and another sheet of 'Polaroid' which is 'crossed' with respect to the front sheet placed between condenser lens and specimen. The effect is the same as that of the single opaque sheet but this arrangement shows in addition whether any of the inhomogeneities are caused by depolarizing substances such as certain organic fibres, which would appear bright.

FORTHCOMING EVENTS

Monday, July 8—Tuesday, July 9

CHEMICAL SOCIETY (in Queen's Building, Queen Mary College, Mile End Road, London, E.1) at 2 p.m. on Monday and 10 a.m. on Tuesday—Symposium on "Solvent Effects and Reaction Mechanism".

Tuesday, July 9

INSTITUTE OF PETROLEUM (at 26 Portland Place, London, W.1), at 4.30 p.m.—Dr. Frederick D. Rossini: "Hydrocarbons from Petroleum".

CIBA FOUNDATION (in the Meeting Room of the Zoological Society of London, Regent's Park, London, N.W.1), at 5 p.m.—Dr. Nathan W. Shock (Baltimore): "Age Changes in Physiological Functions in the Total Animal". (First (Annual) Ciba Foundation Lecture on "Research on Ageing".)

Friday, July 12

BRITISH PSYCHOLOGICAL SOCIETY, INDUSTRIAL SECTION (in the Department of Psychology, Birkbeck College, Malet Street, London, W.C.1), at 1 p.m.—Mr. E. F. Hart: "Methods of Effective Reading".

APPOINTMENTS VACANT

APPLICATIONS are invited for the following appointments on or before the dates mentioned:

LECTURER or ASSISTANT IN PSYCHOLOGY—The Secretary of University Court, The University, Glasgow (July 12).

ASSISTANT LECTURER IN THE DEPARTMENT OF PHYSIOLOGY—The Registrar, The University, Liverpool (July 13).

ASSISTANT LECTURER or LECTURER (with special interests in physical chemistry) IN CHEMISTRY—The Registrar, The University, Sheffield (July 13).

RESEARCH FELLOW IN THE COMPUTING MACHINE LABORATORY—The Registrar, The University, Manchester 13 (July 13).

RESEARCH FELLOW (with postgraduate experience in physiology or allied subjects) IN PHYSIOLOGY, to join work on the physiology of autonomic neuro-effectors—The Secretary, The University, Aberdeen (July 13).

UNIVERSITY LECTURER IN PHILOSOPHY OF SCIENCE—Mr. J. D. Irwin, The Old Schools, The University, Cambridge (July 13).

HEAD (with good qualifications, administrative ability and the capacity to further the development of courses in the application of mathematics to industrial problems) OF THE DEPARTMENT OF MATHEMATICS, including INDUSTRIAL STATISTICS—The Registrar, College of Technology and Commerce, Leicester (July 14).

LECTURER IN EDUCATION—The Principal, Borough Road College, Isleworth, Middlesex (July 15).

PRINCIPAL (with high academic qualifications and considerable experience both in industry and in technical education) OF THE CITY COLLEGE OF TECHNOLOGY, Liverpool—The Director of Education, 15 Sir Thomas Street, Liverpool 1 (July 15).

SENIOR LECTURER IN ORGANIC CHEMISTRY; a SENIOR LECTURER IN MATHEMATICS; a SENIOR LECTURER IN ELECTRICAL ENGINEERING (preferably heavy current); and a SENIOR LECTURER IN BUILDING AND CIVIL ENGINEERING—The Registrar, College of Technology, Suffolk Street, Birmingham (July 17).

SCIENTIFIC COMPUTERS (with an interest in mathematics) to use the latest types of machinery for data processing and statistical calculation—The Group Recruitment Officer, Atomic Energy Research Establishment, Harwell, Didcot, Berks, quoting 888/34 (July 18).

ASSISTANT LECTURER or LECTURER IN CHEMISTRY—The Registrar, University College, Singleton Park, Swansea (July 19).

ASSISTANT FORESTRY OFFICER (with a university degree or diploma in forestry and wide experience in all matters relating to forestry)—The County Land Agent, The Old House, Walton Street, Aylesbury (July 20).

LECTURER (preferably with previous experience of university lecturing in general experimental psychology) IN THE DEPARTMENT OF PSYCHOLOGY, University of Cape Town—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (South Africa, July 20).

RESEARCH FELLOW (graduate of any British university) IN BIOCHEMISTRY OR MICROBIOLOGY—The Registrar, The University, Sheffield (July 20).

SENIOR ASSISTANT ENGINEER (with a university degree and/or member of a senior engineering institution, and experience of design and manufacture of boiler plant) IN THE NUCLEAR POWER SUB-DEPARTMENT, Central Electricity Authority, for duties mainly concerned with the design of reactor pressure vessels, boilers and gas ducting for current nuclear power stations—The Director of Establishments, Central Electricity Authority, Winsley Street, London, W.1, quoting Ref. T/283 (July 20).

ASSISTANT LIBRARIAN (graduate with some library experience)—The Secretary and Registrar, The University, Highfield, Southampton (July 22)

RESEARCH ASSISTANT (graduate mathematician) IN THE COMPUTING LABORATORY—The Head of the Mathematics Department, Northampton College of Advanced Technology, St. John Street, London, E.C.1 (July 22)

SENIOR SCIENTIFIC OFFICER (honours graduate in aeronautical engineering or science (physics and mathematics) or equivalent qualifications) IN THE AERODYNAMIC DIVISION, Weapons Research Establishment, Department of Supply, Salisbury, South Australia, to initiate and participate in research on aerodynamic and aerothermodynamic problems associated with supersonic and hypersonic missiles—The Senior Representative (A.P.78), Department of Supply, Australia House, Strand, London, W.C.2 (July 22).

UNIVERSITY ASSISTANT LECTURER (preferably specialized in statistics) IN MATHEMATICS—The Secretary of the Appointments Committee of the Faculty of Mathematics, The Arts School, Bene't Street, Cambridge (July 24).

SENIOR LECTURER/LECTURER IN (*a*) SOIL MECHANICS AND GEOLOGY; and (*b*) METALLURGY AND STRENGTH OF MATERIALS at Kumasi College of Technology—The Advisory Committee on Colonial Colleges, 1 Woburn Square, London, W.C.1 (July 25).

LECTURER IN APPLIED MATHEMATICS at the University of Adelaide, Australia—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (Australia, July 31).

SENIOR LECTURER IN PHYSICS at the University of Cape Town—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (South Africa, July 31).

SENIOR LECTURER (able to teach electrical machine theory, power circuit theory and give laboratory instruction in the electrical machine theory); and a LECTURER (able to teach general telecommunications and network theory, and electromagnetic theory) IN THE DEPARTMENT OF ELECTRICAL ENGINEERING, University of the Witwatersrand, Johannesburg, South Africa—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (South Africa, August 12).

LECTURER (with a degree in engineering and preferably with experience or interest in some aspects of heavy power electrical design) IN ELECTRICAL ENGINEERING at the University of Western Australia—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (Australia, August 14).

LIBRARIAN (graduate of a recognized university and with professional membership of an approved library association, or equivalent qualification) OF THE FISHER LIBRARY, University of Sydney, Australia—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (Australia, August 14).

LECTURER IN AGRICULTURE (PEDOLOGY AND SOIL SCIENCE); a LECTURER IN AGRICULTURE (ANIMAL NUTRITION); a LECTURER IN AGRICULTURAL CHEMISTRY; and a LECTURER IN AGRICULTURAL ZOOLOGY at the University College of Rhodesia and Nyasaland—The Secretary, Inter-University Council for Higher Education Overseas, 29 Woburn Square, London, W.C.1 (August 15)

LECTURERS (2) (interested in mycology and cytogenetics) IN BOTANY at the University College of Rhodesia and Nyasaland—The Secretary, Inter-University Council for Higher Education Overseas, 29 Woburn Square, London, W.C.1 (August 15).

READER (or SENIOR LECTURER) and a SENIOR LECTURER (qualified in mathematical statistics and, for the more senior position, widely experienced in the application of statistics to practical and managerial problems) IN STATISTICS at the University of Melbourne, Australia—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (Australia, August 15)

SESSIONAL INSTRUCTORS IN CHEMISTRY—The Chairman, Department of Chemistry, University of Alberta, Edmonton, Alberta, Canada (August 31).

DIRECTOR (medically qualified and well acquainted with the field of cancer research) OF RESEARCH, Imperial Cancer Research Fund—The Secretary, Imperial Cancer Research Fund, Royal College of Surgeons of England, Lincoln's Inn Fields, London, W.C.2 (November 1).

ASSISTANT LECTURER (physics graduate, preferably with previous experience of teaching), to assist with the development of the new four-year sandwich course in food technology which begins in October—The Principal, National College of Food Technology, Cranwood Street, City Road, London, E.C.1.

DEMONSTRATOR IN ZOOLOGY—The Registrar, King's College (University of Durham), Newcastle-upon-Tyne.

ELECTRONIC ENGINEERS and PHYSICISTS (with, or obtaining, a first- or second-class honours degree or equivalent with experience or interest in radio, radar and communications; instrumentation for telemetry and other measurements; electronic devices; application of advanced techniques to other fields, for example, armament) at Ministry of Supply Research and Development Establishments chiefly at Malvern, Worcs; Farnborough, Hants; and Sevenoaks, Kent—The Ministry of Labour and National Service Technical and Scientific Register (K), 26 King Street, London, S.W.1, quoting D.514/6A.

GRADUATE IN BIOLOGICAL SCIENCE, to assist in research on mass culture of marine algae—The Professor of Zoology, The University, Southampton.

HEAD (with high academic qualifications and proven farming ability) OF THE DEPARTMENT OF AGRICULTURE, AND FARMS MANAGER, Essex Institute of Agriculture—The Chief Education Officer, County Offices, Chelmsford.

JUNIOR LECTURER (Ph.D. standard in chemistry or biochemistry, and interested in pursuing research in microbiological chemistry) IN THE DEPARTMENT OF BIOCHEMISTRY—The Dean, London School of Hygiene and Tropical Medicine, Keppel Street, London, W.C 1

LABORATORY TECHNICIANS (with a sound knowledge of chemistry and preferably experience of routine biochemical techniques) FOR RESEARCH UNITS—The Administrative Officer, Department of Biochemistry, The University, South Parks Road, Oxford.

LECTURER (preferably with a first-class honours degree in chemical or mechanical engineering, and a taste for personal tuition of students and the initiating and direction of postgraduate research) IN THE DEPARTMENT OF CHEMICAL ENGINEERING—Prof. P. V. Danckwerts, Chemical Engineering Department, Imperial College, London, S.W.7.

ORGANIZING TUTOR/LECTURER (with a good honours degree) IN ZOOLOGY and/or BOTANY—The Director of Extra-Mural Studies, King's College, Joseph Cowen House, 153 Barras Bridge, Newcastle-upon-Tyne 1.

PHARMACIST at the Westmorland County Hospital, Kendal—The Group Secretary, Royal Lancaster Infirmary, Lancaster.

RESEARCH ASSISTANT (with an appropriate degree or expecting to graduate this year) IN THE DEPARTMENT OF PHYSICAL METALLURGY, to work in the field of the physical metallurgy of steel—The Professor of Physical Metallurgy, The University, Birmingham 15.

SENIOR EXPERIMENTAL OFFICER (preferably with a general scientific degree, or at least H.S.C. (science) or equivalent) to assist in the planning and execution of atomic weapon trials—The Senior Recruitment Officer, Atomic Weapons Research Establishment, Aldermaston, Berks, quoting Ref. 1524/34.

SENIOR LABORATORY TECHNICIAN (male, preferably between 24 and 30 years of age) IN THE DEPARTMENT OF CHEMISTRY—The Chief Technician, Chelsea Polytechnic, Manresa Road, London, S.W.3.

SENIOR LECTURER (with a good honours degree and industrial experience in electrical supply or power engineering, and preferably teaching experience) IN ELECTRICAL ENGINEERING—The Principal, North Bedfordshire College of Further Education, Holme Street, Bedford.

STATISTICIAN (British graduate) IN THE DIVISION OF BIOMETRY, Institut National pour l'Etude Agronomique du Congo Belge, Yangambi, district of Stanleyville, Belgian Congo, for work in the design of field experiments, biological assay and sample surveys, and for programming work on I.B.M. equipment—The Director General, I.N.E.A.C., 12 rue aux Laines, Brussels, Belgium.

TECHNICIAN (with some experience in clinical biochemistry and interested in biological work) IN THE ENDOCRINOLOGY LABORATORY—The Royal Marsden Hospital, Fulham Road, London, S.W.3.

Ladies are to be admitted

"The 'Female Physicians' question, thanks to Professor Masson, has made a great stride during the past week. Ladies are to be admitted to study Medicine at Edinburgh University. Imagine the feelings of the non-contents when Professor Masson, in a final outburst, described their argumentation as 'rampageous mysticism, dashed with drivel from Anacreon!'" (*Nature, 1869, 1, i, 25*)

In 1869 scientific clinical methods were nearly as unpopular as women doctors. Today men and women work together in clinical, bacteriological and pathological laboratories all over the world; and in more than seventy countries regard the products of the B.D.H. Laboratory Chemicals Group with equal favour.

LECTURES AND COURSES

SIR JOHN CASS COLLEGE

JEWRY STREET, LONDON, E.C.3
Telephone: ROYal 3383

COURSES FOR DEGREES OF THE UNIVERSITY OF LONDON

The College prepares students by full-time and by part-time study for the Internal B.Sc. (Special) Degrees of the University of London in Chemistry, in Mathematics and in Physics and for the B.Sc.(Eng.) degree in Metallurgy.

There are full-time courses for the External B.Sc. (Special) Degrees in Botany and in Zoology.

Internal B.Sc.(General) Degrees under revised regulations may also be taken by full-time, part-time or evening courses in the above science subjects together with Geology.

Preliminary requirements are met by similar courses of Intermediate standard in these subjects.

Courses, both full-time and part-time, are available for examinations of the Royal Institute of Chemistry, the Institution of Metallurgists and the Institute of Physics.

Facilities are provided for full-time and part-time research and postgraduate work and short courses are held on a variety of special topics

Application forms for enrolment for the Academic year 1957-8, and the College prospectus may be obtained from the Secretary.

COUNTY BOROUGH OF BOURNEMOUTH

BOURNEMOUTH MUNICIPAL COLLEGE OF TECHNOLOGY AND COMMERCE

Principal: M. L. Yates, M.A.(Com.), M.Sc.Tech., Ph.D., M.I.Mech.E.

Full-time and part-time courses are provided in preparation for the following: B.Sc. General (Chemistry, Physics, Biology, Mathematics); B.Sc. Engineering (Electrical, Mechanical); B.Sc. Economics (University of London External Degrees); Accountancy.

Provision is made for students' social and athletic interests

Application for admission should be addressed to the Principal, from whom any further particulars required, may be obtained. Telephone Bournemouth 1520-1.

A. LINDSAY CLEGG,
Town Clerk.

BIRKBECK COLLEGE

(UNIVERSITY OF LONDON)
MALET STREET, W.C.1
SESSION 1957/58

The Postgraduate Course in Crystallography will commence on Monday, September 30. Up to 12 part-time (evening) students can be accepted for the degree of M.Sc. in Crystallography (normally two years) The new teaching laboratory at 32 Torrington Square enables practical instruction to be given in all types of X-ray diffraction and ancillary equipment and in crystal physics. In addition to the basic training the lecture courses cover many special aspects of the subject from which a choice can be made. The course is adapted not only to the needs of students taking the M.Sc. examination in Crystallography but also for students of physics, chemistry, geology, biological and engineering sciences, and those engaged in research and industrial laboratories, who may need to use and understand crystallographic methods.

Further information and a detailed syllabus can be obtained from the Secretary, Physics Department, Birkbeck College.

A limited number of D.S.I.R. Advanced Course Studentships may be available to graduates of London University with a good honours degree in the Faculty of Science, which would enable them to take the examination after one year full-time study.

Application forms for the Session 1958-59, obtainable from the Secretary, Physics Department, Birkbeck College, must be returned to the Secretary not later than February 15, 1958

BATTERSEA COLLEGE OF TECHNOLOGY

MICROWAVE PHYSICS

The following courses in Microwave Physics for part-time and evening students will commence in October, 1957: (a) M.Sc. degree of the University of London. (b) The postgraduate diploma of the College, D.C.T. (Batt.) (c) Postgraduate on (i) Microwave Theory (ii) Microwave Techniques and Measurements.

Application forms and further details may be obtained from the Secretary (Microwave Course), Battersea College of Technology, Battersea Park Road, London, S.W.11,

---

CHELSEA POLYTECHNIC

(COLLEGE OF ADVANCED TECHNOLOGY)
DEPARTMENT OF CHEMISTRY

SANDWICH COURSE IN CHEMISTRY

The Sandwich Course in preparation for the examinations leading to Graduateship of the Royal Institute of Chemistry commences in January, 1958. The course (works based) is of four years' duration and involves six-months' study at College each year. The normal requirements for admission to the course will be success at 'A' Level (G.C.E.), or comparable examinations, in chemistry, together with physics and/or mathematics, and three suitable ordinary level subjects.

Inquiries from industrial firms, research organizations, and government departments will be welcomed. Particulars from the Secretary, Chelsea Polytechnic, Manresa Road, S.W.3.

OFFICIAL APPOINTMENTS

THE GOVERNMENT OF IRAQ INVITES applications for the vacant posts of Economic Botanist and Ecologist in the Ministry of Agriculture at Baghdad in connexion with a current survey of the natural vegetation of Iraq and its economic exploitation. The officials appointed to these posts will be based at Baghdad but will be expected to spend a considerable part of their time in the field in all parts of the country. Travelling allowances sufficient to cover out-of-pocket expenses and transport will be provided by the Government when on official duty away from base. Salaries according to age, qualifications and experience within the range D.150-D.200 per mensem (one Iraqi dinar equals £1 sterling), plus high cost of living bonus (at present rate about D.12 per mensem). The official will be expected to contribute five per cent of his monthly salary to a provident fund to which the Government will likewise contribute a sum equal to ten per cent of his monthly salary, the dues from this fund being payable to the official at the end of his contract. Period of service: two years (subject to a probationary period of six months), renewable by mutual agreement for a further period of one year. Leave at the rate of one day's leave earned for every five days of effective service. Cost of official's passage from his country of origin to Iraq on first appointment and back home at the end of his contract will be defrayed by the Government.—Candidates should write to the Director-General of Agriculture, Baghdad, stating full name, date and place of birth, nationality, religion (also father's full name and nationality at birth and mother's maiden name and nationality at birth) and giving a brief outline of their education, academic distinctions (date and subject of graduation) and of their subsequent career, mentioning the posts they have previously held, the salary of their present post, and the salary they are now asking. Applications should be accompanied by references from at least two qualified authorities

---

SHEFFIELD REGIONAL HOSPITAL BOARD

SHEFFIELD NO. 4 HOSPITAL MANAGEMENT COMMITTEE

RADIOTHERAPY CENTRE
ASSISTANT PHYSICIST

Applications are invited for two appointments in the Physics Department of the Sheffield National Centre for Radiotherapy. (a) Appointment in the Principal Grade for Physicist with wide experience of hospital physics work. The successful candidate will act as Deputy to the Chief Physicist. (b) A second appointment in the Senior or Basic Grade, according to qualification and experience. Salary according to the Whitley Council Scales.

Applications, with names of at least two referees, should be sent to the Secretary, "Broom Cross," Tree Root Walk, Sheffield, 10, within 14 days of the appearance of this advertisement. Further particulars may be obtained on application to the Secretary.

MACAULAY INSTITUTE FOR SOIL RESEARCH

Applications are invited for the appointment of a Soil Surveyor (male) in the Department of Pedology, Soil Survey (Scotland) Section. Candidates should possess a first- or second-class honours degree (science) The appointment will be made in the Scientific Officer Grade and the starting salary within the range £565 to £995, according to age, qualifications and experience. Superannuation under F.S.S.U.

Forms of application may be obtained from The Secretary, The Macaulay Institute for Soil Research, Craigiebuckler, Aberdeen, to whom they should be returned before August 31, 1957.

COMMONWEALTH of AUSTRALIA

AUSTRALIAN DEFENCE SCIENTIFIC SERVICE

AERODYNAMIC DIVISION

The Weapons Research Establishment of the Department of Supply, Salisbury, South Australia, invite applications for a position of Senior Scientific Officer, from honours graduates in aeronautical engineering or science (physics and mathematics) or other academic qualifications and research achievements considered the equivalent. Several years postgraduate research experience required. Salary: £A.2,103 to £A.2,268. Duties: Initiate and participate in research on aerodynamic and aerothermodynamic problems associated with supersonic and hypersonic missiles. Location: Salisbury, sixteen miles from Adelaide, South Australia. Whilst position is classified as temporary, tenure of employment is not limited and after a specified period, appointee will be able to apply for entry to Commonwealth Superannuation Scheme. First-class boat fare for appointee and dependants (wife and dependent children) will be paid under specified conditions, by the Commonwealth of Australia. Assistance will be given with accommodation.

Application forms, together with a descriptive leaflet, obtainable from Senior Representative (A.P.78), Department of Supply, Australia House, Strand, London, W.C.2, with whom applications should be lodged by July 22, 1957

BRITISH IRON AND STEEL RESEARCH ASSOCIATION

Research Assistant required in the Physical Chemistry Laboratory of the Chemistry Department of the Association in London, to take active part in laboratory research work on the physico-chemical studies of ferrous metallurgical processes. The work is interesting and future prospects are good. Candidates should have H.N.C. or equivalent qualification and should be capable of constructing experimental apparatus. Some experience in chemical analysis is also desirable. Starting salary up to £700 per annum according to age, qualifications and experience.

Written applications only, quoting "C.P.7," to the Personnel Officer, B.I.S.R.A., 11 Park Lane, London, W.1.

NATIONAL INSTITUTE FOR RESEARCH IN DAIRYING

Statistician required for biometrical research and consultation in the Section of Statistics. Applicants should have a good honours degree in mathematics or statistics. Appointment in Scientific Officer (£565 to £995) or Senior Scientific Officer (£1,075 to £1,265) grade according to age and experience

Applications, naming two referees, to Secretary, N.I.R.D., Shinfield, Reading. Quote ref. 57/9.

SESSIONAL INSTRUCTORSHIPS

Applications are invited for Sessional Instructorships in chemistry at $2,400 for eight months. Besides doing some laboratory instructing, candidates will do graduate work towards the M.Sc. or Ph.D. degrees in chemistry.

Applications for the 1957-58 session should be made before August 31 to the Chairman, Department of Chemistry, University of Alberta, Edmonton, Alberta, Canada.

MEDICAL RESEARCH COUNCIL REQUIRE graduate Biochemists (preferably female) with good honours degrees for work at their Infantile Malnutrition Research Unit, Mulago Hospital, Kampala, Uganda. Candidates should have at least two years' postgraduate experience of biochemical work. Starting salary (subject to U.K. income tax) at point on scale £815 by £50 to £1,015 by £60 to £1,255 by £70 to £1,395 per annum, according to age and experience. Foreign Service Allowance (not subject to U.K. income tax and payable only while in Uganda) of £295 per annum will also be paid. The total net income equals that of comparable staff employed by the Uganda Government. Appointment for initial tour of 18 months plus 90 days' home leave (including Sundays and travelling time) but possibility of further tour(s) leading to permanent employment with the Council. Superannuation provision will be made under the Federated Superannuation System for Universities; alternatively, it can be made under the National Health Service Superannuation Scheme, if appropriate. Furnished living quarters provided at a rental of £54 per annum. Subject to completion of satisfactory tour, travelling expenses paid both ways.—Write (full personal particulars and experience and names of two professional referees), to Personnel Officer, Medical Research Council, 38 Old Queen Street, Westminster, S.W.1.

THE SPECTROSCOPY OF FLAMES

by

A. G. GAYDON, D.SC., F.R.S.

(Warren Research Fellow of the Royal Society)

10" × 6¼" 279 *pages* *Illustrated* 50*s. net*

This new book, although it covers slightly different ground, aims at replacing Dr. Gaydon's previous book *Spectroscopy and Combustion Theory*. The author and his colleagues at Imperial College have been associated with the development of a number of recent experimental techniques for controlling flames or for exciting flametype spectra in special sources. These techniques and the results obtained by them are given special emphasis in the work.

GAS CHROMATOGRAPHY

by

A. I. M. KEULEMANS

(Research Chemist, Koninklijke/Shell Laboratorium, Amsterdam)

A new Reinhold Book 9¼" × 6" 217 *pages* *Illustrated* 60*s. net*

A concise, practical manual and an authentic, up-to-date summary of the field of gas chromatography written by chemists who have for many years been among the most active investigators of all varieties of chromatography.

TEACHERS IN TECHNICAL COLLEGES

It is now recognized that, in spite of some definite shortcomings, the White Paper on Technical Education published in February 1956 is something of a landmark. It did not, perhaps, distinguish sufficiently clearly between the functions of the technical colleges and the colleges of technology and the university departments of technology, nor did it attempt to assess the quantitative demand for technicians and craftsmen. However, it recognized clearly enough that Britain's needs would only be met if the understanding and support of parents as well as of industry could be secured, and also that buildings were only a part of the problem. A critical factor was the supply of teachers.

This subject was not considered in any detail in the White Paper, which stated that there were at that time some 11,000 full-time and 46,000 part-time teachers in technical colleges, about 9,500 of whom were school teachers who teach in the technical colleges in the evening; and it merely observed that many more teachers would be required to enable the annual output of students from advanced courses to be increased to 15,000 in 1960, and that of students attending part-time day courses during working hours from 335,000 to double that figure. It was recognized that the quality of the teaching staff would be just as important as numbers if the technical colleges were to contribute appropriately to the output of scientists and technologists and to the supply of technicians and craftsmen required by industry and commerce. In June 1950, however, Sir David Eccles, then Minister of Education, appointed a committee, under the chairmanship of Dr. Willis Jackson, to consider, in the light of the White Paper, the supply and training of full-time and part-time teachers for technical colleges, and this committee has now reported*.

Apart from the estimates as to the demand for teachers, the report contains little that is fresh. There are some novel recommendations, but essentially no new suggestions regarding sources of supply. Nevertheless, the report is sane and constructive, and throws a welcome emphasis on factors that are frequently neglected. The problems to be solved are clearly displayed; just as the shortage is the resultant of neglect in many different directions, so is the adequate supply of Britain's needs in technical manpower shown to depend on a united effort in which the Government, the local authorities, the universities, industry and the general public as well as the colleges themselves, teachers and the schools have their own parts to play.

As to the present staffing of the technical colleges, there are no Ministry statistics later than those for March 1955, when some 10,000 full-time and 44,000 part-time teachers were in establishments of further education having day-work, other than art establishments. The colleges themselves reported 11,455 full-time teachers (including some in art establishments engaged on technical work) and 38,959 part-time (omitting some teachers engaged on evening-work only) in the 1955–56 session. These latter figures were used by the Committee in arriving at its estimate that the number of teachers would require to be increased by about 8,500 by 1960–61 to carry the additional load involved in the White Paper's proposals, or about 1,700 annually, compared with the annual average of 1,100 for 1952–55. This calculation, moreover, is based on the present average number of teaching hours per teacher, and even if the expansion in student numbers proceeds more slowly than the colleges anticipate, this rate of expansion is desirable to permit some reduction in average teaching hours, which for some individuals the Committee regards as excessive. This annual increment is to be made up of about 1,430 full-time teachers and about 1,600 part-time teachers, and should suffice to carry the expected increase of nearly 50 per cent in the teaching load and meet the desire of the colleges to see the full-time teachers in 1960–61 carrying 71 per cent of the total teaching load in place of the present 65 per cent. This aim is generally supported by the Committee and is regarded as a necessary consequence of the expansion in day-release work. Moreover, it provides a permanent and stabilizing factor in colleges, giving an element of continuity which is particularly necessary when most of the student body is made up of part-time students. Further, it simplifies administration and organization, while full-time staff can devote time to the general welfare and social life of the college as a whole in a way that could not reasonably be expected from a large body of part-time teachers. The programme of work of a full-time teacher can also be framed so as to give him adequate time for careful preparation, marking, devising and setting up experiments and visual aids, and for taking a personal interest in the progress and careers of his students.

These are all major factors in the relation between staff and student, and are particularly important with part-time students. Furthermore, while even with this swing to full-time teaching the colleges will require an extra 8,000 part-time teachers by 1960–61, it is possible the colleges may have under-estimated the relief which part-time teachers can give to the full-time teachers; and while there are other reasons for hoping that industry will be able and willing to release staff at all levels for part-time teaching, it is wise to assume that this average annual increase of 1,600 part-time teachers during the next five years is a minimum one. There is the further problem, which Dr. Willis Jackson stressed in explaining the report at the Conference organized by the Federation of British Industries on May 15, that acute difficulty is likely to be encountered in securing an adequate supply of well-qualified teachers of science or technology for professional courses at intermediate and advanced level. For these courses an increase is required of about 1,250 in the number of science graduates and of about 1,350 in the number of technology graduates. Disregarding staff wastage, which is at present unduly high, these figures mean raising the average net increase in the number of mathematics and science graduates in service from about 200 to 250 and of technology graduates from 90 to 265.

---

* Ministry of Education. The Supply and Training of Teachers for Technical Colleges: Report of a Special Committee appointed by the Minister of Education in September, 1956. Pp. xiv + 68. (London: H.M. Stationery Office, 1957.) 4s. net.

Before considering what Dr. Willis Jackson described as the kernel of the report—the provisions for meeting the needs and especially those making teaching in technical colleges as attractive as it should be—it should be noted that the colleges since the War have sometimes had great difficulty in recruiting sufficient staff, particularly in the fields of science and technology. These difficulties in recruitment have been in the quality as well as in the number of applicants, and they have led to the overloading of the full-time staff in terms of class-contact hours, to the undesirable use of part-time staff through inability to fill full-time posts, and to an excessive turnover of staff since promotion at other colleges is so easy to secure. There is also risk of lowering the standard of the profession, since staff of inadequate quality is sometimes appointed.

The future requirements of British technical colleges for teachers are thus large, and in the main they are for specialists, who must be attracted from other forms of employment in which they are in equally great demand. The Committee can suggest no substantial fresh source of supply, and recognizes that no large source of persons suitable for full-time appointments remains untouched. The additional teachers must come, in the main, as they have always done, from industry, from university teaching and from the schools; but although the Committee believes that some married women with qualifications in mathematics and science may prefer teaching in technical colleges to teaching in schools, it does not appear to look to women teachers, either full-time or part-time, as likely to provide any considerable source of supply.

One possible field of recruitment to which the Committee directs attention is the Armed Services, where there are now many people with accepted qualifications as a result of Service training. Since the requirements of the Services are likely to be reduced, the Committee makes the reasonable suggestion that positive measures should be taken to ensure that all technically qualified regular officers and Service-men are made fully aware of the opportunities in technical education, and it believes that much more could be done to supply the Forces Resettlement Service with up-to-date information about technical education and the great need for teachers. Equally sound are the suggestions, in accordance with the tendency for the creativeness of a research worker to diminish in middle age or later, that measures should be taken to ensure that these opportunities and needs in technical education should also be brought effectively to the notice of such workers in the Scientific Civil Service, the research associations and in industry. Apart from this factor, the changing interests and growth in experience of such research workers might well lead a certain proportion to take up technical teaching and bring to the colleges an outlook and an expert knowledge of special subjects which would be of great value.

Such measures illustrate one factor on which the success of the recruitment campaign, as the Committee sees it, will depend: a willingness to develop unconventional sources of recruitment. That factor is also illustrated by the observations on the use of part-time teachers not only from industry but also from Government establishments and elsewhere, particularly in the remarks as to special inducements. There is sound sense in the observation that, to attract such staff of the calibre required, inducements should not be thought of as primarily financial: staff are much more likely to be attracted by offering them a special status in college life, with a title such as 'special lecturer' or occasionally 'special reader'.

Here, however, the other two factors which the Committee stresses as conditioning success are involved: establishment of a closer partnership between the colleges and industry; and a determined effort on the part of all concerned to raise the status of technical teachers and the attractiveness of their calling. It is recognized that the assistance and support of governing bodies and the local education authorities concerned will also be required, and on this point of co-operation the report is forthright. The Federation of British Industries in its "Handbook on Industry and the Technical Colleges" issued last autumn was content to remark that industry could help the colleges by assisting the recruitment of part-time lecturers of the right type. Dr. Willis Jackson and his colleagues are convinced that there is still too marked a tendency for educational institutions and industry to be regarded, and to regard themselves, as separate and distinct rather than as intimately associated partners in a joint enterprise. The real problem is being ignored so long as the possible gain by a technical college of a highly qualified and experienced recruit from industry is regarded as a loss to be resisted. For some time to come, industry must be prepared to encourage and assist the transfer to full-time teaching work of experienced staff members it can ill afford to lose, as the only means of ensuring a much augmented supply of junior recruits of high quality.

The value of a much greater interchange of staff and ideas in furthering the wide publicity required in order to attract sufficient additional teachers is obvious. Evidence submitted to the Committee suggests that at present more than a quarter of the new staff recruited by the technical colleges are teachers transferring from full-time service in schools. Disregarding the effect of such transfer on the schools, and disregarding the possibility that it may in due course be affected by the activities of the Industrial Fund for the Advancement of Scientific Education in Schools, this source of supply does not meet the vital need for more graduate technologists. To increase the supply of teachers of technology from 150 to 360 a year will require a great effort from all concerned.

To secure the desired co-operation from industry and government departments as well as from the Ministry of Education, the local education authorities and the technical colleges, every effort must be made to arrange the most effective deployment of staff. Nor is this simply a matter affecting teaching staff alone—particularly the more highly qualified members—and the rationalization of courses. It implies avoiding waste of special skill and knowledge on duties which do not require it, and seeing that highly qualified members of staff do not waste their time on routine clerical work or maintenance and repair of equipment but are provided with adequate clerical and laboratory assistance. This applies also in industry and elsewhere if the full potentialities of the additional sources of supply suggested in the report are to be realized.

More than the elimination of waste of skilled effort is involved here. Such conditions are an important factor in attracting staff of high quality, and the Committee comments wisely in the same connexion on the importance of allowing the mature entrant from the Armed Services, from industry or from research institutions full credit for his previous experience in determining his salary. The difficulties in regard to pension schemes are fully recognized, but the Committee considers that industrial pension schemes should provide, whenever possible, for a paid-up policy to be granted to those who resign to take up teaching, so that a pension will be due to them on their eventual retirement.

The remarks on research and consultant work are tempered by a like appreciation of the value of such conditions in attracting the right type of recruit, and in establishing the status and dignity which are essential for the maintenance of high professional standards. The major expansion in research in technical colleges should, in the Committee's view, be in the application of fundamental knowledge to problems of design and production; but it also urges the prosecution of research into teaching methods, particularly as applied to special branches of technology. The prime consideration is here the benefit to the teacher himself, though the value of both research and consultant work to local industry is not overlooked; from the same point of view the report stresses the importance of encouraging teachers to extend their technical knowledge and to improve their qualifications, of a liberal policy in regard to leave to attend scientific and technological conferences and of reasonable standards of accommodation.

Dr. Willis Jackson and his colleagues have produced a report which is pervaded by the same liberal spirit and understanding of the mind of the scientist and technologist as marked the Barlow Report on scientific staff more than a decade ago. Whereas, however, implementation of the recommendations of the latter report was a matter for Government administrators alone, those of the present report are addressed to industry, to local education authorities and to many others, including the college authorities, many government bodies as well as the Ministry of Education and professional associations and the teachers themselves. To bring a more liberal outlook into technical education also depends on wide-spread co-operation, and all these considerations give special importance to the two novel proposals of the report.

First, the Committee is convinced that residential conferences, lasting two or three weeks, for senior members of the staff of technical colleges, would be of considerable benefit, alike in identifying and studying major problems connected with the aims, ideas and growth of technical education, stimulating new methods and attitudes in the colleges, fostering a more catholic understanding of the functions of technical colleges and keeping teachers in touch with new trends in science and technology. Accordingly it is recommended that the Minister of Education should establish a staff college with its own board of governors and appoint a director of studies to plan the programme and guide its execution. Secondly, it is recommended that an advisory committee be established on the supply and training of teachers for further education, the duty of which would be to review the arrangements and provision for training and to keep in touch with the technical colleges as regards the supply of teachers and the demand for different types of training courses.

Time may well be required to implement these latter recommendations; nor can the proposal for further proliferation of the bodies concerned with technical education be entertained without careful consideration, if only on account of the demands it may make on the time of experienced and trained man-power. Meanwhile, however, the report sets forth—with cogency and a sense of urgency—practical ways in which professional bodies, technical college authorities, industrialists and teachers themselves could work together to meet a desperate need, and to establish the conditions which should ensure an increasing supply of teachers of high quality both for colleges of technology and for the technical colleges. Not the least of these opportunities, and one for which every scientist and technologist shares some measure of responsibility, is that of educating public opinion as to what is involved and thus securing the public understanding needed both to ensure a steady supply of students for the colleges and the adoption of the appropriate measures by local education authorities.

TERMINOLOGY IN PHYSICS AND ELECTRONICS

The International Dictionary of Physics and Electronics

Pp. xvii+1004. (London: Macmillan and Co., Ltd., 1956.) 120*s*. net.

PHYSICS has derived its vocabulary from several sources. Unlike some other sciences it has always made much use of everyday words, adapting their meanings, usually by restricting them, to the needs of experiment and theory and giving many a quantitative sense. Although it continues to absorb words in this way, it has increasingly had to resort to supplementary sources. Thus the names of prominent physicists have provided many adjectives to qualify effects, theories, quantities and instruments in addition to being used as units. Much can be said for the practice, provided ambiguity and obscurity are avoided. No physicist misunderstands, for example, the terms Planck's constant, Curie temperature, Geiger counter or Doppler effect; the Faraday effect or the Ramsden eyepiece may demand a moment's reflexion, but the Thomas precession, the Ettinghausen effect and the de Sitter universe are best left to the specialists. A few names—Gauss, Fermi, Debye—are overworked. Many of the letters of the English alphabet and some of the Greek form a second source of widely used adjectives; some are abbreviations (for example, *F*-centre), some form a sequence (thus, *K*-, *L*-, . . . shells and, hence, *K*-capture) and a few were previously used as symbols (for example, *k*-space). Many new nouns, including isotope, lumen, positron, ferrimagnetism, had to be coined, not always with the approval of etymologists.

Electronics uses many of the words of physics, but, dealing so much with complex components and with effects not found naturally, has also required new words.

The need to define the words and terms of the two subjects has long been realized, and both national and international bodies have sought to meet it. Very few dictionaries have been produced, however, so that the new International Dictionary could be an important addition. Its authors are mostly American, supported by four from Britain, and they have made use of work by American physical and radio institutions; there is no specific reference to the British Standards Institution, however, which has dealt extensively with terminology in branches of applied physics and in radio.

The definitions given in the new Dictionary are well worded and the fuller explanations given of many of the commoner terms will be of value to students. The cross-referencing is adequate and a sense of proportion is maintained between pure and applied physics and between the abstract and the concrete. The excellent definitions of the many mathematical theorems, functions, equations and operations used in the two subjects deserve special mention. Terms in physical chemistry and in meteorology are included, but the extent to which the meteorological terms will be consulted may not justify their inclusion.

If a few criticisms are made they must not be read as detracting seriously from the value of the Dictionary. The diagrams, though not numerous (one is given twice, however), are not always well chosen; some electronic circuits are too complex and do not use uniform symbols. Some words, such as vocoder and frequency changer, mean different things in America and Britain, but only the American meanings are given. Finer differences between British definitions and those of America may cause a little confusion also. Does the *E*-layer of the ionosphere extend from 100 to 150 km. (British Standards Institution) or from 90 to 160 km. (as this Dictionary says)? Is a wave impedance deduced from transverse components (British Standards Institution) or from appropriate components (this Dictionary)? Although the entries total about 10,000, the following are some of those omitted: Bitter patterns, Nyquist diagram (or criterion), square-loop material, forward scatter, guard-ring, Vickers hardness (Brinell, Rockwell, Bierbaum and Moh are included), types of diamond, superfluidity (superfluid occurs in the definition of heat flush), Heaviside calculus, delta modulation, photodiode, caesium clock and Ayrton–Perry winding. The titles of articles in a recent issue of an American physics journal contained several words not included (for example, super-paramagnetism and granulometry), but the fault could sometimes be with authors who coin new words before the need is fully established.

The distinction between the Zener and the avalanche effects is not made clear. Some American trade names of magnetic materials are included, for example, 'Hypernick' and 'Hypersil', but some, usually European, names of long standing, such as 'Stalloy', 'Alnico' and 'Radiometal', are not. The entries of some non-metric units might have been shortened to a few tables, or omitted. The editors were perhaps compelled to include such inelegant terms as blacker-than-black, bottoming (topping presumably for a *p-n-p* transistor), breakoffski, 'hot' (highly radioactive) and scram (to shut down a reactor); let their inclusion be a warning to scientists of language degradation.

Mistakes or misleading statements are rare. Meacham is misspelt once; electron diffraction does not show the wave-like character of electron *beams*, and frequency and non-linear distortion are better termed attenuation and amplitude distortion respectively. The dictionary can certainly be paid the compliment of being interesting; indeed, one has to guard against the risk of becoming so absorbed in the entries on the page at which it happens to open—and in the cross-references that one is led to—as to forget the particular entry that one intended to consult.

J. R. Tillman

SWEDISH EXPLORATION IN SOUTH AFRICA

South African Animal Life

Results of the Lund University Expedition in 1950–1951. Edited by Bertil Hanström, P. Brinck and Gustaf Rudebeck. Vol. 1: Pp. vi+518. Vol. 2: Pp. vii+576. Vol. 3: Pp. vi+492. (Stockholm: Almqvist and Wiksell, 1955 and 1956.) 68 Sw. Kr. per volume.

LINNAEUS once wrote: "There is no place in the world with so many rare plants, animals, insects, and other wonders of Nature as Africa, and it seems as if they have been concentrated to the Cape". This interest in the flora and fauna of South Africa was shared by a number of Swedish naturalists, and a three hundred years old history of Swedish endeavour in this field culminates in a recent expedition organized by Prof. Bertil Hanström, and executed by Drs. Per Brinck and Gustaf Rudebeck, accompanied and assisted by their wives, Mrs. Gunvor Brinck and Mrs. Inga Rudebeck. The expedition, which was supported by grants from the Swedish Natural Sciences Research Council and from private funds, started in October 1950 and returned to Sweden in August 1951. In collaboration with South African biologists and biological institutions, large collections chiefly of invertebrate material were made from more than 350 localities in the Cape, Orange Free State, Natal, Transvaal, South-West Africa, Bechuanaland, Northern and Southern Rhodesia, Swaziland and Basutoland. On the whole, most of the collections were made from terrestrial and limnic biotopes, and they are the largest ever to reach the Zoological Institute at Lund. From there they have been distributed to more than a hundred specialists in about twenty countries, and the results of their findings are to be published in a work of eight volumes under the title: "South African Animal Life". Three of these volumes have already appeared. Vol. 1 contains an introduction by Bertil Hanström, a short history of Swedish exploration of South African animal life during two hundred years, by Per Brinck, and a list of localities investigated by the expedition, by Per Brinck and Gustaf Rudebeck. Chapters 3–6 deal with Turbellaria, Solifugae, scorpions and Pedipalpi, Pseudoscorpionida, and a monograph on the whirligig beetles. Seventeen chapters on the Symphyla, Chilopoda and Insecta, and a first chapter on birds form the contents of Vol. 2, and Vol. 3 deals with a further eighteen insect groups, besides two chapters devoted to the Ixodoidea, and the Proterospermophora among the Diplopoda.

In the interest of speedy publication of the material, accounts of the various groups will appear as they are completed and not in systematic order. From the first three volumes it is abundantly clear that the series will make important contributions to our knowledge of the taxonomy and distribution of South African terrestrial and freshwater invertebrates and also vertebrates, as well as to the solution of the problems of the development, evolution, and age of the relic fauna of the southern part of the African Continent. The volumes are excellently produced, and are well illustrated by clear line drawings, maps and photographs. It is naturally impossible in this context to scrutinize the taxonomic merits of the individual contributions. Short articles on the zoogeography and ecology of groups, keys and check lists, and extensive bibliographies, add to the value of the taxonomic accounts.

We are witnessing here the birth of a faunistic work of great importance which, I am certain, will become a classic in its field. A courageous enterprise, inspired, no doubt, by Linnaean tradition, it sprung from an idea which occurred to Prof. Hanström while on a visit to South Africa for the purpose of collecting mammalian material for endocrinological studies. Collections of invertebrates made during field excursions convinced him of the justification for a special expedition equipped with modern ideas and tools, and after his return he succeeded in organizing an enterprise on which collectors, taxonomists and editors alike are to be congratulated.

O. Lowenstein

OXINE AND ITS DERIVATIVES

Oxine and its Derivatives

By R. G. W. Hollingshead. Vol. 3: Derivatives of Oxine—Part 1. Pp. vi+617–896+16. Vol. 4: Derivatives of Oxine—Part 2. Pp. vi+897–1211+41. (London: Butterworths Scientific Publications, 1956.) 42*s*. each volume.

These two volumes bring to completion a work of over 1,200 pages on 8-hydroxyquinoline (oxine) and its derivatives. This substance, known since 1880, was not used as an analytical reagent until forty-five years later. A short monograph on its use was published by Berg in 1933 and many original papers have been written in recent years. The preceding two volumes which appeared in 1954 gave an exhaustive account of the reagent and of its behaviour with almost every metal and in great detail. The main use of oxine is as a precipitant for aluminium, magnesium and zinc, but innumerable other applications in analysis were reviewed, some of which may stand the test of time. The author had preferred to include everything rather than to make a critical selection.

The third and fourth volumes, which have now appeared, are devoted to derivatives of 8-hydroxyquinoline, including its salts. Analytical applications are less numerous in these volumes, which are very largely concerned with descriptive organic chemistry. 8-Hydroxyquinoline, its salts and various derivatives have proved useful as bactericides, amœbicides and fungicides, and a chapter is finally devoted to a survey of theories and experiments on their mode of action in these respects.

The author is to be congratulated on a magnificent work of compilation. The volumes are excellently produced, with a subject-index to each volume, and in Volume 4 there is also a patent index and an index of authors. It is perhaps regrettable that a combined subject-index was not provided. The references to the literature include items extending into 1956. However, much of the descriptive chemistry, which greatly adds to the bulk of these two volumes, might have been curtailed or omitted, for any research worker in this field would certainly consult the original papers. The question may be asked: Can we afford publication on this scale about every organic compound which has practical applications? G. M. Bennett

THERMOCHEMISTRY

Experimental Thermochemistry

Measurement of Heats of Reaction. Edited by Frederick D. Rossini. (Prepared under the International Union of Pure and Applied Chemistry by the Sub-Commission on Experimental Thermochemistry.) Pp. xv+326. (New York: Interscience Publishers, Inc.; London: Interscience Publishers, Ltd., 1956.) 7.80 dollars.

This book, which is written by experts for experts, deals chiefly with organic compounds; inorganic substances are scarcely discussed. The volume opens with a chapter entitled "General Principles of Modern Thermochemistry", taken mostly from "Chemical Thermodynamics", by F. D. Rossini (1950), and closes with a chapter by the same author entitled "Assignment of Uncertainties to Thermochemical Data", taken from Rossini and Deming (*J. Wash. Acad. Sci.*, 29, 416; 1939). The other twelve chapters which contain original contributions discuss fundamental constants; the calibration of calorimeters for flame and bomb reactions; standard states and corrections; and the combustion of organic oxygen, nitrogen, sulphur, chlorine, bromine and iodine compounds. Reactions other than combustion are treated in ten pages while the microcalorimetry of slow phenomena occupies fifty pages. A brief section deals with physicochemical standards for thermochemistry and the book ends with an inadequate subject-index of two pages containing references to ninety-nine items.

A beginner will not find here sufficient drawings or descriptions of apparatus to enable him to start work. Indeed he would search this book in vain for a description of the exact conditions necessary to ensure complete combustion when he calibrates his bomb calorimeter by using benzoic acid. On p. 40 he will find that "If any soot is found outside the crucible, the experiment is rejected. . . . The weight of any soot found in the crucible is determined". However, p. 44 reveals that it is not easy to determine the weight of this soot. On p. 135 he will read, "In the benzoic acid experiments it is found that, with the proper crucible and pelleting, complete combustion occurs in all but a very few experiments". Nevertheless, he may receive some encouragement from the statement (p. 291) that "benzoic acid will burn completely to form carbon dioxide and water under proper conditions but that the investigator must be alert to the possibility of incomplete combustion". He may well conclude that there is much art in this science. One disadvantage of having employed thirteen writers to prepare this book is that certain subjects (for example, the corrections to standard states) have been treated several times. The opportunity should be taken in later editions to unify the text so that the space saved may be devoted to more detailed information on experimental procedures.

E. F. G. Herington

DIFFERENTIAL EQUATIONS

Differential Equations

By S. V. Fagg. (Applied Mathematics Series.) Pp. 128. (London: English Universities Press, Ltd., 1956.) 7*s.* 6*d.* net.

Differential Equations

By Prof. Harry W. Reddick and Prof. Donald E. Kibbey. Third edition. Pp. ix+304. (New York: John Wiley and Sons, Inc.; London: Chapman and Hall, Ltd., 1956.) 36*s.* net.

Elementary Differential Equations

By William Ted Martin and Eric Reissner. (Addison-Wesley Mathematics Series.) Pp. xi+260. (Cambridge, Mass.: Addison-Wesley Publishing Company, Inc., 1956.) 5.50 dollars.

Ordinary Non-Linear Differential Equations in Engineering and Physical Sciences

By Prof. N. W. McLachlan. Second edition. Pp. x+271. (Oxford: Clarendon Press; London: Oxford University Press, 1956.) 35*s.* net.

Partial Differential Equations

By Prof. G. F. D. Duff. Pp. x+248. (Toronto: University of Toronto Press; London: Oxford University Press, 1956.) 35*s.* net.

Transactions of the Symposium on Partial Differential Equations

Held at the University of California, Berkeley, June 20–July 1, 1955. Editorial Committee: N. Aronszajn, A. Douglis and C. B. Morrey, Jr. (Sponsored by Office of Naval Research; University of California, Berkeley, Calif.; University of Kansas, Lawrence, Kan.; and the American Mathematical Society.) (Reprinted from Communications on Pure and Applied Mathematics, Vol. 9, No. 3, issued by the Institute of Mathematical Sciences of New York University.) Pp. vi+334. (New York: Interscience Publishers, Inc.; London: Interscience Publishers, Ltd., 1956.) 6.50 dollars.

THE set of six books under review divides naturally into two parts: three elementary text-books and three advanced expositions, one of which is a collection of papers delivered at a symposium. The text-books overlap considerably in content with various others on the same subject which are already in print, and it is perhaps unfortunate that so many elementary texts on differential equations are available. The time must surely come when a rationalization of policy with regard to the publication of technical text-books will emerge; but that time is not yet, and meanwhile students and teaching staffs have to face a baffling array of books covering much the same ground in the process of making a choice.

The book by Fagg has the merit of brevity (and hence low price) and it discusses numerous practical examples. Its appeal is at the school level, except for a chapter on the Laplace transform designed to whet the appetite of the more serious reader. Reddick and Kibbey also emphasize practicality, but their book is more extensive (although still elementary) and the third edition contains some new features, such as sections on partial differential equations and the adjoint equation, together with many new exercises. Martin and Reissner have written a book for students of science and engineering who "need to know mathematics rather well". Their text covers more ground than the two previous books and, in addition to a chapter on finite difference equations, describes methods for solving various heat-transfer problems.

The three other books are much more advanced and deal with research topics. McLachlan's book, a revised version of the 1950 edition, is based on lectures given to graduate students at the Universities of Illinois and Washington and at Michigan State University. Its purpose is "to provide engineers and physicists with a practical introduction to . . . non-linear differential equations, and to give representative applications in engineering and physics". This it does exceedingly well. It is not an analytical treatise with technical applications, but rather shows "how certain types of non-linear problems may be solved, and how experimental results may be interpreted by the aid of non-linear analysis". Included are chapters on equations having periodic coefficients or periodic solutions. Graphical and numerical solutions are emphasized, and four theorems are presented for dealing with singular points and stability criteria. The book should be of particular value to engineers concerned with control problems.

The theory of partial differential equations continues to develop; and Duff's book describes particularly advances which have been made over the past twenty years. Equations of the first and second orders are discussed "from the tensor calculus point of view", which is general and penetrating. There is a chapter on linear integral equations and another on the integration of the wave equation. The latter is concerned primarily with the method of Riesz, involving integrals of fractional order. The exposition is concentrated in places and the book is definitely one for the pure mathematician or very theoretical physicist.

The last book records most of the lectures given at a symposium. These lectures, delivered by specialists, cover a wide field. Some deal with local or regularity properties of solutions, others with equations arising in applied mathematics, and still others with numerical solutions and estimates for eigenvalues. A glance at the contents list reveals a very healthy activity in research on differential equations, and the current deep and widespread interest in the subject justifies the appearance of the books under review.

L. S. Goddard

British Trees

A Guide for Everyman. By Miles Hadfield. Pp. xxv+468 (150 full-page drawings). (London: J. M. Dent and Sons, Ltd., 1957.) 30s. net.

MR. M. HADFIELD has produced a thoroughly reliable and readable book on the trees to be found in the British countryside, in plantations and in gardens. "British Trees" is perhaps a misnomer for a book that describes the 'monkey puzzle', Douglas fir, Japanese larch, Atlantic cedar, deodar, Bhutan pine, Corsican pine, Monterey pine, tulip tree, catalpa and dozens of others which are not indigenous to Britain but are perhaps so common as almost to be considered native. The arrangement followed is that of Rehder in his "Manual of Cultivated Trees and Shrubs". Each species treated is illustrated by clear line drawings to scale which show the leaf, long and short shoots, buds, flowers and fruit. These should render identification easy. The text gives a description of the species and also much interesting and entertaining information about the tree, its variations and its forms. The diseases and pests to which the species are prone are also mentioned.

The book is well got up and printing errors and mis-statements are few, though the compositor went astray with the epithet 'bignonioides', since the variants 'bignoniodes' and 'bignoniodies' are to be found in the index. *Gleditsia* is recorded as having a smooth bark. That may be true, provided one disregards the fearsome branched thorns one finds upon it.

The author holds strong views about botanical nomenclature. "Botanical nomenclature, unlike botanical classification, is empirical, unscientific, and occasionally grossly misleading." I, myself, hold strong views about his strong views and will be content to call this statement grossly misleading. This clash of opinions will not prevent me from recommending this work as a really excellent reference book, which should find its place on the shelves of every tree lover.

N. L. Bor

New Pathways in Cellular Pathology

By Prof. Gordon Roy Cameron. Pp. vii+90. (London: Edward Arnold (Publishers), Ltd., 1956.) 16s. net.

IN 1954 and 1955 Prof. G. R. Cameron gave two lectures in Leeds and Dublin on the cell, which aroused so much interest that he was persuaded to expand them into a monograph, and this attractive little book is the result. He summarizes modern views on the different parts of the cell, with chapters on cell-surface, cytoplasm, nucleus, mitochondria, microsomes and other cell components. There are forty-two figures showing sections of tissues, enlarged with optical microscopes and with electron microscopes, and diagrams of cell structure and of biochemical changes. The whole book can be read in an hour or two, and it gives an interesting picture of the way modern pathologists have not only been able to use new techniques to extend our knowledge of structure but have also started to find out something about the biochemical functions of the different structures.

Some of the best parts of the book are based on work done in Prof. Cameron's own laboratory and cover a wide range of topics. In recent years he and his colleagues have, for example, shown that some of the effects of thioacetamide on the respiration of liver cells are due to the accumulation of calcium in the liver. They have obtained evidence that much of the damage done by carbon tetrachloride is due to physical changes in the mitochondria, which lose coenzymes and eventually become converted into vacuoles. They have managed to produce copper deficiency in rats, and found it to be associated with a failure to synthesize phospholipid and eventually with loss of cytochrome oxidase in the mitochondria. Such studies are throwing fundamental light on pathological processes. This book opens the window to a view of the pathology of the future.

J. H. Gaddum

Le Ciel et la Terre

André Danjon, Pierre Pruvost, Jules Blache (Directeurs). (Tome III de l'Encyclopédie Française.) Pp. 452+32 planches. (Paris: Librairie Larousse, 1956.) Cartonnage souple, 7,450 francs; similoid, 8,850 francs; parchemin véritable, 11,950 francs.

IN this unusual volume, thirty-six leading French astronomers, geologists and geophysicists have co-operated in the production of a remarkably complete and readable guide to modern developments in their respective fields. About one-third of the book (140 large quarto pages of text and most of the plates) is devoted to astronomy and is divided into four sections: "The Earth and Solar System", "The Sun and Stars", "Galaxies" and "Evolutionary Problems". The remainder is divided into three sections: "The Terrestrial Globe", "The Earth's Crust", and "The Formation of the Earth's Relief". Each section is divided into one or more chapters, which in turn contain articles contributed by various authors. The book is bound in a loose-leaf filing system, so that it may be kept as up to date as possible by adding further articles from time to time as they are published.

The authors have succeeded in compressing a large amount of information into a few words in such a way that the results and the main lines of argument stand out very clearly; the reader is then referred to other works for the detailed theoretical and experimental developments. The emphasis is on the results of recent research throughout, the more 'classical' fields being only briefly summarized. The illustrations are excellent, and the editors have succeeded in welding the various contributions into a coherent and unified text. Only the bibliography (at the end of the book) appears to be somewhat too restricted.

Bernard Pagel

Reports on the Progress of Applied Chemistry

Vol. 40, 1955. Edited by H. S. Rooke. Pp. 1000. (London: Society of Chemical Industry, 1956.) 60s.

THIS very useful annual review of progress in chemical industry continues to maintain its position as a guide to a very large field of work. The articles are written by specialists and cover the literature very adequately. The one on the corrosion of metals, for example, dealing with the work of one year, has 150 references. In some cases, as in the section on animal and vegetable oils, there are summarizing tables. There is an interesting description of radioactive tracer elements, and the section on synthetic fibres records progress in this field. Very complete indexes make it easy to find information on any topic dealt with in the book.

J. R. Partington

THE JODRELL BANK RADIO TELESCOPE

By Prof. A. C. B. LOVELL, O.B.E., F.R.S.

THE large radio telescope which has been built at the Jodrell Bank Experimental Station of the University of Manchester is nearly complete. It is frequently stated that the instrument is the largest radio telescope in existence. This is quite erroneous without a good deal of qualification. The telescope is essentially a paraboloidal steel bowl 250 ft. in diameter, with the focus in the aperture plane, built so that it can be directed towards any part of the sky. It is, therefore, relatively small compared with many radio telescopes elsewhere. For example, aerials of the 'Mills Cross' type have been built with an extension of more than a mile, and even one element of Ryle's adjustable cylindrical parabolic interferometer system which is nearing completion near Cambridge has a 50 per cent greater surface area. Nevertheless, the instrument at Jodrell Bank is believed to be by far the largest completely steerable pencil-beam type of radio telescope in existence, although considerable uncertainty exists as to the Russian facilities in this type of work. Its nearest operational competitors in size are the 80-ft. diameter telescopes at Dwingeloo in Holland, and near Bonn in Western Germany, although both these instruments are figured to a much higher degree of accuracy and are designed for work on much shorter wave-lengths than the Jodrell Bank telescope. In the next few years it is expected that 90-ft. aperture radio telescopes will be built at the California Institute of Technology, a 140-ft. instrument for the U.S. National Radio Observatory of Associated Universities Incorporated at Greenbank, Virginia, and one of 200- to 300-ft. aperture near Sydney. Hence, even although the British instrument has taken two years longer to build than originally specified, it is likely to rank as the major instrument of this type for radio astronomical research for a considerable time.

The engineers responsible for the telescope are Messrs. Husband and Co., of Sheffield and London. When the idea for the instrument was first put forward in 1948 and 1949 many engineers refused to consider the possibility of its construction. Mr. H. C. Husband, however, believed that the task could be accomplished, and the results of his work and of his team of designers now stand in the shape of more than two thousand tons of steel on the Cheshire plain. In principle the motion of the telescope is altazimuth. The bowl, which weighs about seven hundred tons, is driven in elevation by a Ward–Leonard system through two 27-ft. racks from the dismantled battleship *Royal Sovereign*. These are mounted 170 ft. above ground on two towers which themselves rotate on a 350-ft. railway track to give the motion in azimuth. The drive is through two bogies under each tower, again through a Ward–Leonard system. Four additional bogies, which are undriven, serve as wind carriages on each side of the structure. The towers are connected near ground-level through a heavy diametral girder system supported on the central pivot which is the fundamental locating part of the telescope. The power and instrumental cables come through this central pivot into a motor room situated within the diametral girder immediately above the central pivot. This room contains the motor generator sets and controls for the Ward–Leonard system.

The 17-ft. gauge double railway track on which the telescope rotates is mounted on deep-piled foundations

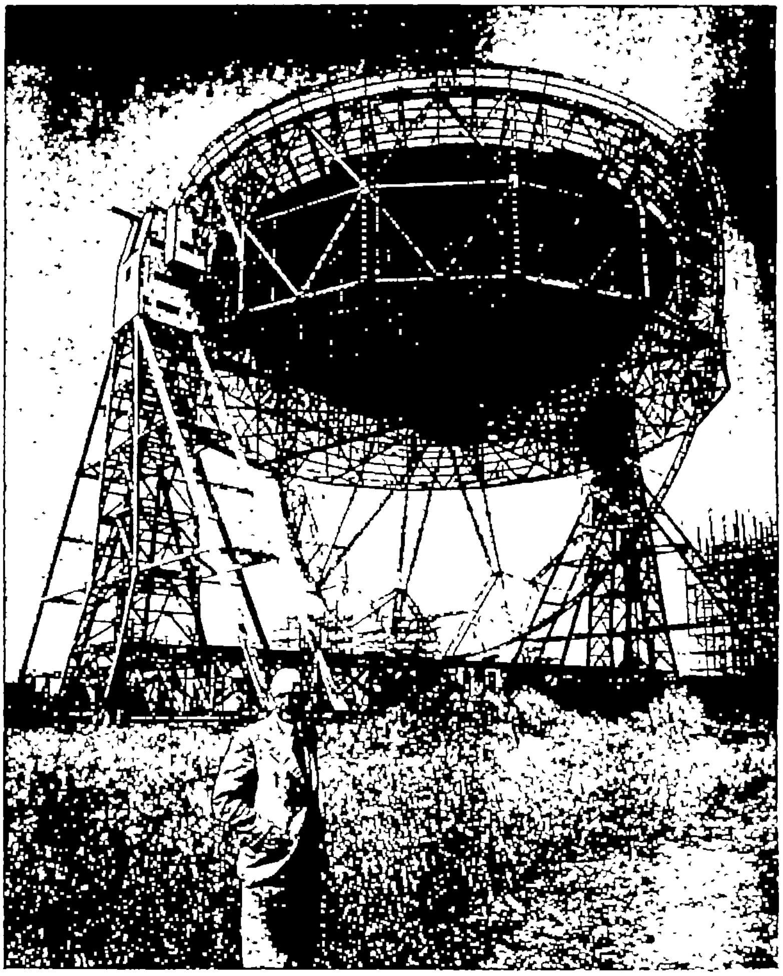

Fig. 1. The Radio Telescope at Jodrell Bank nearing completion. In the foreground is Prof. A. C. B. Lovell

which extend in some places to 90 ft. underground. The various power, control and instrumental cables are taken into an annular laboratory underneath the central pivot and then through an underground tunnel to the control room. This control room houses the main control racks and console. The computer system consists of magslip resolvers working in servo loops to solve the necessary equations in order that the telescope can be given a sidereal movement. A wide range of movements can be selected at the control desk, for example, automatic sidereal motion at a given right ascension and declination, motion in galactic latitude and longitude, straightforward motion in azimuth and elevation, and various automatic scanning movements with a choice of rasters. Parallax corrections can also be introduced when it is desired to track a body in the solar system. There are no slip rings so that the danger of creating electrical interference is avoided, and the limit of motion is 420 degrees, after which an automatic reversal takes place.

The specification calls for a tracking accuracy of at least 12 minutes of arc at speeds up to 4 degrees per minute. The maximum slewing speed is about 22 degrees per minute in azimuth and elevation. The position of the telescope in azimuth and elevation is repeated back to the control room through magslips driven by accurately machined chain racks independently of the driving system. The specification requires these positions to be repeated to an accuracy of ± 1 minute of arc.

The reflecting membrane is of $\frac{1}{16}$ in. thick steel sheet welded from 7,000 individual sections of about 3 ft. × 3 ft. on to the purlins of the steel framework. It has been essential to ensure good conductivity across these welded sections otherwise the membrane would become very lossy at certain wave-lengths. The primary aerial feed is carried at the focus on a steel tower built up 62½ ft. from the apex of the paraboloid.

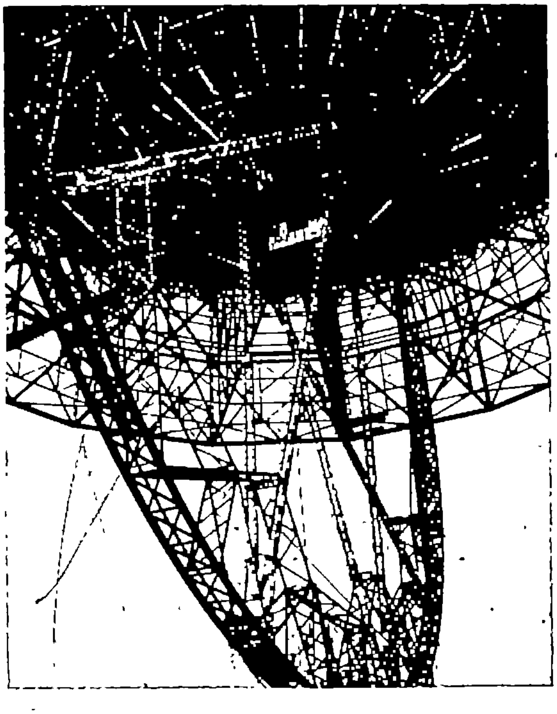

Fig. 2. Underside of the bowl showing the stabilizing wheel, which is 250 ft. in diameter, and the hanging laboratory

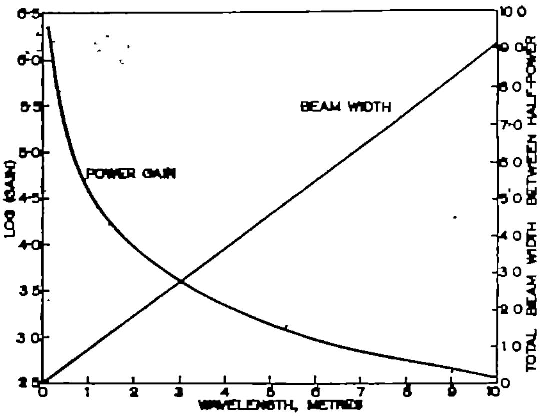

Fig. 3. Calculated power gain and beam width of the 250-ft. aperture radio telescope as a function of wave-length

This tower diminishes in cross-section rapidly with height in order to avoid obscuration and scattering from the primary feed. It was, however, essential to design it with sufficient stiffness so that no displacement occurred as the bowl turns over. An important scientific requirement is that easy access can be attained to the primary feed so that the operational wave-length can be changed readily. Originally it was intended to have an access tower which could move out on tracks on top of the diametral girder to put the operator in reach of the aerial when the bowl was inverted. This was later abandoned in favour of a system whereby the aerial is mounted on a 50-ft. steel tube which slides into the top of the aerial tower. With the bowl inverted this can be winched down to ground-level and replaced by another 50-ft. tube complete with aerial system. The radio-frequency cables from the aerial run inside this tube and can be reached from a small platform near the base of the tower when the bowl is facing towards the zenith.

In much of the work it will be necessary to mount the radio-frequency pre-amplifiers and other parts of the receiving equipment as close as possible to the aerial. These essential units will be contained in a small laboratory which swings underneath the bowl. Further laboratory space is available at the tops of the two towers, but even from those the minimum length of cable run to the primary feed is about 200 ft. Other scientific apparatus will be installed on the base girders; but the main recording apparatus will be in laboratories adjacent to the control room.

From the astronomical point of view the success of the engineers will be judged by the accuracy with which the telescope moves and the extent to which the reflecting membrane retains its paraboloidal shape in different aspects and under various wind conditions. The theoretical curves showing the beam width and power gain as a function of wave-length are shown in Fig. 3. Calculations have been made of the effect of irregularities in the membrane on the power gain, from which it is clear that, except at very short wave-lengths for which the telescope is not primarily designed, large distortions are permissible without any appreciable effect on the performance of the telescope. During the next few months it is hoped to begin the scientific programme by establishing these curves on an experimental basis by observing certain radio sources at different azimuths and elevations over a range of wave-lengths.

Those interested in the immediate scientific programme of the radio telescope may be referred to the forty-seventh Kelvin Lecture[1], where its tasks are set against the current background of knowledge in radio astronomy. It is sufficient to remark at this stage that all the developments which have occurred in radio astronomy during the past years have served to underline the importance of this telescope. With this instrument, together with the large interferometric systems in Cambridge, Great Britain can reasonably look forward to a most fruitful period in radio astronomy.

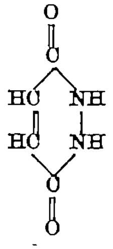
Prof. R. T. WILLIAMS
Department of Biochemistry, St. Mary's Hospital Medical School, London, W.1

IN 1949 maleic hydrazide (I), 1 : 2-dihydropyridazine-3 : 6-dione, was introduced as a plant growth regulator and has since found a number of important commercial uses as a selective weed killer and as a depressant of plant growth in a variety of circumstances. The mode of action of maleic hydrazide on the plant cell is not clearly understood. There is some evidence that it may interfere with the metabolism or action of the natural growth regulators of plant cells (auxins)[1,2].



(I)

By the conventional tests used to study mammalian toxicity, maleic hydrazide appears to be virtually harmless, and large doses are tolerated by rats, mice, guinea pigs, dogs and hens. The *LD*50 for rats is stated to be 4 gm./kgm. and rats were unaffected by a life-time on a diet which contained up to 1 per cent maleic hydrazide[3]. In confirmation of this, we observed in preliminary experiments no effect on the growth of young rats receiving a diet containing 1 per cent maleic hydrazide. The fact that the growth of plant cells may be affected by concentrations of 0·001 per cent suggests that the action of maleic hydrazide is in some way specific for plant, as distinct from mammalian, tissues. However, during the study of the action of maleic hydrazide on *Vicia faba* roots, Darlington and McLeish[4] found that the arrest of cell division was accompanied by chromosome breakage. They noted that maleic hydrazide causes breakage of the heterochromatin of the plant cells, whereas X-rays break only the euchromatin. Nevertheless, they concluded as follows: "Since nearly all chromosome breaking agents have so far proved to be cancer producing as well, we must hope that the agricultural use of this new agent will not be encouraged before suitable tests are made".

What follows is a summary of the work that has been done since the above communication appeared, in an attempt to show whether or not maleic hydrazide possesses any carcinogenic properties for mammalian tissues. In the meanwhile, the warning had been taken very seriously by makers and users of maleic hydrazide in Britain, and the use of maleic hydrazide has been restricted to situations where contamination of food crops would not occur. Nevertheless, there are potential uses for maleic hydrazide in suppressing sprouting of stored vegetables, for example, where food contamination might take place. Apart from the specific problem as it relates to maleic hydrazide, this account illustrates some of the difficulties of accumulating satisfactory evidence in order to substantiate the negative assertion that a given substance is not a carcinogen.

Soon after Darlington and McLeish's communication appeared, experiments were started at the Chester Beatty Research Institute in which solutions of maleic hydrazide (1 c.c. of the diethanolamine salt, each c.c. containing 5 mgm.) were injected subcutaneously at approximately weekly intervals for fourteen months into rats. Of the total of fifty-two rats so treated in two experiments, three developed sarcomata, whereas of the controls receiving saline none developed tumours. Although rats develop sarcoma after the injection of foreign materials, the incidence in this particular experiment was unusually high and a further experiment was planned using rats and mice. The results from this experiment are summarized in Table 1. Groups of young males and females of each species were given maleic hydrazide either by a weekly subcutaneous injection of a dose of 500 mgm./kgm. (monosodium salt) in aqueous solution or

* In many mice autolysis was too far advanced to make histological examination worth while.
† The survival time of those animals that died in less than 100 weeks.
‡ Rats receiving the diet as a powder grow less rapidly and do not reach the final weight of those receiving the diet as cubes.

received a standard diet (*MRC* 41 in powder form) containing 1 per cent maleic hydrazide added as a dry powder. The experiment ran for 100 weeks. Control animals received weekly injections of the same volume of saline or the same powdered diet without the addition of maleic hydrazide. Unless post-mortem autolysis was advanced, macroscopical and microscopical examinations of all the dead animals were carried out. As the majority of the animals were aged at the time of their death, they showed a wide range of pathological changes in their organs, particularly in the lungs and kidneys.

Clearly maleic hydrazide had no effect on the growth and general health of the rats or mice. A special search was made for tumours and many doubtful lesions were subjected to special and independent scrutiny by two of us (R. D. P. and P. N. M.). The most common tumours were the fibroepithelial mammary tumours in the female rats and lung adenomata in mice. These tumours were of the types commonly encountered in the ordinary laboratory strains of rats and mice. The possible malignancy of some of these tumours may be a matter of debate, but in this experiment the types found in the control animals did not differ from those seen in the groups receiving maleic hydrazide. Lymph gland tumours (lymphomas) were also seen in both species. Tumours of undoubted malignancy included two sarcomata and four carcinomata of the lungs. When the results were collected it was clear that the administration of maleic hydrazide by mouth or by weekly injection to rats and mice over a period of two years had not resulted in any increase in the incidence of tumours (Table 2). In this experiment, twenty-nine rats received weekly subcutaneous injections of maleic hydrazide, but only one of the animals developed a sarcoma at the injection site. This contrasts with the figure of three out of the total of fifty-two noted in the preliminary experiment which was carried out on rats of the same stock.

7. Sarcoma	—	1	—	1
8. Pituitary adenoma	—	1	—	—
Total incidence	9/40	13/59	10/40	16/57

The possibility that any carcinogenic property possessed by maleic hydrazide might be enhanced by the administration of a co-carcinogen was tested by applying maleic hydrazide with croton oil to mouse skin. Two mice developed tumours out of twenty-one treated, but seven mice out of fifty-three developed tumours with croton oil treatment alone[4]. This finding indicated that maleic hydrazide had no tumour-initiating action on mouse skin (for definition see Salaman and Roe, *Brit. J. Cancer*, 7, 472; 1953). Further tests for carcinogenicity by prolonged application alone to mouse skin were not carried out, because so far it has been found that all substances carcinogenic for mouse skin are also initiators of carcinogenesis in the same tissue. (However, not all initiators of carcinogenesis are also carcinogenic in mouse skin, though they may be for other tissues.)

In a further experiment, pellets of cholesterol containing 20 per cent maleic hydrazide were implanted into the bladders of mice. No tumours developed in a group of fourteen mice which survived forty weeks[4].

Further work was done in order to see whether maleic hydrazide displayed any action on growing mammalian cells. Large doses (125 mgm./kgm.) were given to rats bearing Walker tumours, but no effect on tumour growth or cell mitosis was observed. The effect on mammalian cells was further examined by studying the development of mitosis in fragments of mouse ear epidermis grown in a phosphate buffer containing glucose. In concentrations from 0·0001 to 0·001 *M*, maleic hydrazide had no effect on mitosis or cell division in the mouse epidermis.

Maleic hydrazide was also tested upon skin from the guinea pig's ear grown in tissue culture in a medium containing serum, glucose, Krebs–Ringer phosphate and streptomycin hydrochloride. Up to a concentration of 0·01 *M*, maleic hydrazide had no gross or microscopical effects upon the explants. The same concentration of maleic hydrazide was also without effect upon the respiration of skin cells studied 2 and 22 hr. after adding the maleic hydrazide.

An attempt to follow the metabolism of maleic hydrazide in mammals was made in a study on rabbits. After an oral dose of 100 mgm./kgm., 43–62 per cent of the maleic hydrazide was excreted unchanged within the first 48 hr. With larger doses (2 gm.), the unchanged maleic hydrazide was isolated and characterized as its benzylamine salt. No other metabolites such as glucuronides or ethereal sulphates were found, so that the 40 per cent maleic hydrazide unaccounted for may either be excreted slowly over long periods or else is broken down and destroyed.

In conclusion, it may be stated with reasonable certainty that maleic hydrazide is without significant effect on the growth of normal mammals or isolated mammalian tissues. This is strong evidence against maleic hydrazide having any activity comparable to that of well-known carcinogens. The absence of any significantly greater number of tumours in male or female rats and mice receiving maleic hydrazide by two routes over a period of two years makes it improbable that it is even a weak carcinogen for these species or that some metabolite of maleic hydrazide has any such effect. A further study of the mode of action of maleic hydrazide on plant cells may perhaps eventually help us to understand why the chromosomes of plant cells but not those of mammalian cells are broken when cells are acted on by maleic hydrazide. Meanwhile, it seems reasonable to claim that proper tests have now been made, and the weight of evidence provided by the results of these tests is that maleic hydrazide has no carcinogenic properties.

We wish to thank Mr. C. R. Kennedy (Medical Research Council Toxicology Research Unit) for his work in maintaining the long-term experiment on rats and mice. Messrs. Whiffen kindly supplied a specially purified sodium salt of maleic hydrazide for the experiment.

ATOMIC ENERGY AND ITS BIOLOGICAL IMPLICATIONS*

By SIR JOHN COCKCROFT, O.M., K.C.B., C.B.E., F.R.S.

Director of the Atomic Energy Research Establishment, Harwell

THE feasibility of the large-scale generation of electricity from nuclear energy has been demonstrated during the past year by the commission and operation of the Calder Hall nuclear power station. This power station, which derives its heat from two nuclear reactors, generates 90 megawatts of electricity, of which about 20 megawatts are used internally to drive the blowers which circulate the carbon dioxide gas used for transfer of heat. Most of the net output of electricity flows into the British National Grid. Our experience in the start-up and operation of this reactor has been very satisfactory. We have had few troubles associated with the nuclear part of the system—indeed, there is very little except the fuel elements to go wrong. Each reactor contains 10,000 fuel elements, consisting of uranium rods sheathed in a magnesium alloy. The function of the sheath is to prevent oxidation of the uranium by the hot carbon dioxide gas, and to contain the radioactive fission products which are produced in the chain reaction. Very great care is taken in the sealing of the magnesium cans and only three failures of the seals have been discovered in twelve months of operation. The failures are due to a slight crack developing usually in a weld and a small amount of radioactivity leaks into the heat transfer gas. This is at once detected by electronic devices and the defective fuel element is then removed. In future power stations the fuel elements are expected to stay in the reactor for four or five years, by which time each ton of uranium will have developed the heat equivalent of 10,000 tons of coal. At the end of this time the chain reaction would slow down, so the fuel elements have to be changed. They are withdrawn by a mechanical discharge machine (which is heavily shielded) and then sent down a chute into a pond, where they lie shielded by a depth of 10 ft. or so of water for about 100 days.

During this time the radioactivity of the short-lived radioisotopes decreases. The activity of radio-iodine, for example, which has a half-life of eight days, decreases about 6,000-fold. The fuel rods are then sent to the chemical processing plant at Windscale and dissolved. In this process the volatile fission products, such as radioiodine and the fission gases, radioxenon and radiokrypton, are at present allowed to escape from a high stack, but the activity at ground-level is well below the accepted tolerance level. Radioiodine can be detected in the thyroids of sheep grazing grass nearby, but again the activity is too low to be harmful.

The other radioactive waste products are separated from the spent uranium and the plutonium in the chemical plant. The waste products are concentrated by evaporation and then stored in large stainless steel tanks. The actual physical volume of the waste is very small and the cost of storage of the wastes is likely to contribute only 1 or 2 per cent to the cost of nuclear power. We have started to separate from the waste products radioactive caesium and strontium and to use these for medical and industrial purposes. Thus a new 1,000-curie source of radiocaesium has been made for the Royal Marsden Hospital for cancer therapy. The radiocaesium emits 0·662-MeV. gamma-rays and has a half-life of about thirty years. It has the advantage of emitting a more penetrating radiation than that available from most X-ray sets, and requires little or no maintenance.

---

* The substance of the Fison Memorial Lecture delivered at Guy's Hospital Medical School on May 31.

We expect to produce about ten such sources a year for the next two or three years, and after that to produce still larger sources for industrial use.

Besides these highly radioactive wastes, we usually have radioactive effluents arising from plant washings, laundering clothes and so on. We treat these in an effluent-treatment plant and reduce the activity ten- or twenty-fold by standard precipitation methods. The remaining activity is then so low that it can be dispersed through a large pipe-line into the sea, where normal mixing processes dilute it into about 10^{16} cm.^{3} in the course of a single day, by which time the average of activity is within the level at which it could be drunk safely if it were not saline. Extensive biological monitoring of the activity levels in fish, seaweed and on beaches ensures that the effluent discharges are limited to activity levels which cannot possibly produce any harmful effects. These levels are prescribed by the responsible Ministry.

Although a nuclear power station does not itself discharge more than minute traces of radioactivity to sea and air, the operating reactor is a powerful source of radiation. Indeed, a Calder Hall reactor emits radiations as powerful as about 1,000 tons of radium. For this reason the reactors are enclosed in thick concrete walls known as the biological shields. The thickness is such that at the outside surface of the shield the radiation is at the so-called 'maximum permissible level', which means that during a working week an operator exposed full-time to this radiation could receive a maximum dose of 0·3 rem.

Inside the biological shield the radiation intensity is much higher, even if the reactor is shut down. On some occasions maintenance work has to be carried out. Whenever possible, this is done by remote handling devices, sometimes guided by a television eye. In very rare cases where human beings have to enter regions of high radiation intensity, the operation is so timed that the integral dose received is kept to a very low level of 1–2 rem. The integral dose of even the most highly exposed employees is limited to 5 rem a year.

The most remarkable example of remote repairs was the complete dismantling of the Chalk River heavy-water nuclear reactor, following a reactor accident in which no one was hurt. By an elaborately controlled operation lasting about a year, the whole interior was dismantled progressively. There were no significant over-exposures—either in the accident itself or in the laborious dismantling process—to external radiation or to the dangerous strontium-90 isotope in the fission-product contamination. So we are rapidly learning how to work with intense radioactivity in complete safety.

In the operation of research reactors there are similar but somewhat more difficult problems, since the shield of the reactor is pierced by numerous holes normally sealed by concrete plugs which can be withdrawn to allow beams of neutrons to emerge. Radiation levels above the maximum permissible level occur near the emergent beams, which must therefore be carefully labelled by notices, and avoided by the people working with them.

The monitoring of working conditions, both for external radiation from gamma-rays or neutrons and to prevent the risk of inhalation or ingestion of fission products, is carried out by health physicists, whose job it is to see that workers do not receive more than the permissible exposure. Individual workers carry film-badges which are developed weekly so that individual doses are recorded. In addition, they may carry pocket dosimeters, and are equipped with a range of portable and installed radiation monitors and alarm devices around reactors which help the health physicists and other staff to ensure that over-exposure does not occur. A similar close watch is kept on the chemical laboratory, where the chemists may be working with highly active sources, and in all high-activity areas continuous-running radioactive dust monitors and radiation alarms are installed. An occasional spill may produce radioactive contamination on the floor and in the air which has to be prevented from spreading. For this purpose a decontamination squad is available—if necessary, dressed in frog-suits.

The basis of the permissible levels of exposure has been worked out over a long period of years. In the early days of exposure to X-rays there were many examples of serious harm to individuals due to excessive doses of radiation. In the Cavendish Laboratory where I worked we had cases of skin trouble in assistants handling radium. I remember a demonstration of X-ray pictures being given which led to skin burns; in my own experimental work we used to hold up a fluorescent screen in our laboratory and judge the intensity of the radiation to which we were exposed by the intensity of the glow. If it was too bright we added another millimetre of lead shielding. It is remarkable that we are alive and well to-day.

When we started our war-time Anglo-Canadian atomic energy project at Chalk River, we had more appreciation of radiation hazards, and two of the first members of our staff were senior university radiobiologists. They took charge of our radiological protection, and since then have played a major part in working out the radiological protection policy of Great Britain. Radiological protection has been superintended since 1946 by the M.R.C. Radiological Protection Committee and the International Commission on Radiological Protection. These bodies have worked out a long list of 'maximum permissible levels'. For example, the maximum dose of radiation to the whole body in one week is laid down as 0·3 rem The maximum quantity of plutonium which may be retained in the system by occupationally exposed workers is 0·04 microcurie; the maximum amount of strontium-90 is 1 microcurie. The basis of the permissible levels for ingested materials such as radium and plutonium is the extensive experience with radium in human beings from instances among radium dial painters who afterwards developed bone tumours, and from early therapeutic and diagnostic practice. Animal experiments by Brues were the basis of determination of the relative effects of radium and strontium. Further studies are in progress by the Committee of the Medical Research Council. The whole subject of the radiation exposure of man was reviewed a year ago by a committee of the Medical Research Council which was set up specifically to report on the hazards to man of nuclear and allied radiations. A similar committee was appointed by the U.S. National Academy of Sciences and both committees reported a year ago. Their recommendations were remarkably similar.

Some important new information was presented to the Medical Research Council Committee on the effect of radiation in inducing leukæmia. This came from investigations, conducted by Court Brown and Doll, on the case-histories of a particular treatment in British hospitals for ankylosing spondylitis. Broadly speaking, the natural incidence of leukæmia, which is about 1 in 20,000 per year, was increased three- to ten-fold in these cases by a radiation dose of 200 roentgens. However, when radiation is received at smaller dose-rates, evidence from mice suggests that the effect on leukæmia production would be less. Mole's experience at the Medical Research Council Radiobiological Research Unit with mice and their radiation-induced leukæmia (which is a poor model for human leukæmia, but the best available) is that "with total doses of 500–1,000 r. the incidence of leukemia may depend very markedly on whether the dose is given by continuous irradiation (from a cobalt-60 source) or in a series of brief exposures each at a relatively high dose (from an X-ray machine)". Nevertheless, the Medical Research Council Committee recommends that the life-dose for occupationally exposed workers should be limited to 200 rem.

A further measure of protection to occupational workers was suggested—that the dose to the gonads up to the age of thirty should be limited to 50 rem. This limit was set for a different reason—to prevent the chance of conceiving an abnormal child being increased by more than a marginal value. For example, the incidence in the population of severe mental deficiency in children which survive has been estimated to be about 1 : 500. If the mutation rate had been doubled by radiation in one parent the chance of producing a defective child would be increased by about 1·5 per cent. For this reason, the permissible dose up to the age of thirty has now been limited to 50 rem and the average yearly working dose to 5 rem.

Another important recommendation of both reports was concerned with the genetic protection of the human race as a whole. It is well known that radiation can increase the rate of mutation substantially above the spontaneous mutation rate, the mutants being of identical character as far as is known. A common mutant is that producing schizophrenia. There are about 63,000 cases under hospital care in Britain at the present time. Doubling the mutation rate by radiation would lead to 200 more cases in the first generation of 20 million births in Britain and 63,000 more cases for hospital care in the very long term. The American report predicted that a doubling of the mutation rate would lead eventually to an additional 2,000,000 instances of tangible inherited defect in the United States.

It is therefore important to know quantitatively how the mutation rate increases with the cumulative radiation dose up to the age of procreation. The only worth-while evidence so far comes from experiments on fruit-flies and mice. These experiments have been carried out on only a few readily identifiable types of mutations. The statistics, such as they are, suggest that the mutation rate increases linearly with cumulative radiation doses up to about 600 rads. So the curve of mutation rate against this will have an intersection at zero dose corresponding to the natural mutation rate. The effects of radiation seem to vary considerably for different gene loci and our knowledge is at present small and we have little or none for man.

The Committees came to the conclusion that the radiation dose required to double the mutation rate probably lay between 30 and 80 r. A good yardstick for measuring the effect of man-made radiation was the natural radiation dose to which everyone is subjected by the cosmic rays, radium in the ground and potassium in the blood. This gives a dose of 3 rem in thirty years to those who live in England and about 10 per cent more for those living in granite country such as Aberdeen. Dwellers at 10,000 ft. can receive up to 5 rem in thirty years. The Committees suggested that the dose of radiation additional to the natural radiation should be limited to about twice the natural dose—that is, about 6 rem in thirty years. Both Committees feel that too high a contribution to this is already being provided by diagnostic radiology. In Britain, from a sample hospital survey, it appears that this contributes at least 22 per cent of the natural dose. In the United States it was much larger. This is now being inquired into by a committee under Lord Adrian, and it is evident that substantial reductions can be made—indeed, it has happened already in some hospitals.

Other smaller contributions to the population dose are provided by wrist-watches, television sets and from fall-out from atomic weapons. The dose due to fall-out is at present 0·6 per cent of the natural background, mainly due to the ingestion of cæsium-137.

The contribution from the exposure of atomic energy workers in Britain is rather smaller than this. Records are kept of the exposure of all workers in atomic energy establishments, and these show that in the United Kingdom the average dose is 0·25 rem. per annum, so if this level continues it would contribute 7·5 rem in thirty years. Since the population in atomic energy establishments is less than one-thousandth of the total population and only exposure before the age of reproduction is effective genetically, the net contribution to the population is less than 0·1 per cent of the natural dose per annum.

The Medical Research Council Committee discussed another important aspect of fall-out—the ingestion of strontium-90, which reaches human bodies through three steps in the food-chain. Explosions of megaton fission bombs send fission products into the high stratosphere, whence they settle only slowly into the troposphere over a period of five to ten years or more. During this time the strontium-90 decays with a half-life of twenty-eight years. When the activity reaches the troposphere it is washed down by rain. From measurements taken by aircraft, we have some idea of the fission content of the stratosphere. Dr. W. F. Libby has stated that for the past two years it has corresponded to 24 megatons of fission. We also measure the strontium-90 content of rain-water. In this way we can make approximate estimates of the level of soil contamination likely to result. The Medical Research Council report suggested that by 1956 it might increase four-fold over the level at December 1955 from bombs already exploded, and that, should the various types of explosions continue at the rate then current, the accumulated deposits might rise to about fifty times the 1956 level in a hundred years time. The strontium-89 and strontium-90 deposited by rain finds its way to roots and so into the plant, or it may be deposited directly on grass and food crops. Large areas of grass are eaten by cows and so the strontium-90 appears in milk, whence it is transmitted to human bones. For the past three years measurements of the deposition of strontium-90 in soil and herbage, and its concentration in milk and human bones, have been carried out in Britain and the United States and other countries. It is convenient to consider the results in terms of a 'strontium unit' which is one micromicrocurie per gram of calcium in soil, milk or bone. The cumulative fall-out is rising, but the level in milk has been fairly constant since the middle of 1955 and now ranges from four to ten strontium units, depending on locality. The Medical Research Council Committee report sets a limit of 100 strontium units for concentration in human bones, but said that immediate consideration would have to be given if the level rose to 10 strontium units.* They thought this might happen in one or two decades from the bomb explosions already carried out. The present level in Britain is at most 1·5 strontium units, which is still a good way from the 10 strontium unit level.

A good deal of discussion and controversy has recently resulted from a report of a committee of the Atomic Scientists' Association on the hazards introduced by fall-out. The report attempts to calculate the number of bone cancers to be expected from the production of one megaton of fission products. The starting point for this calculation is an estimate of the number of bone cancers produced by 0·1 microcurie of radium, this being the maximum permissible level for radium in the skeleton for occupational workers. The report uses the survey, presented by Hasterlik to the Geneva Conference, of the clinical effects on a number of patients in the Chicago area who were treated with radium injections twenty to thirty years ago. From this the Atomic Scientists' Association Committee calculates that a radium burden of 0·1 microcurie would lead to a 1 : 200 chance of producing a bone cancer. This conclusion is considered by some medical statisticians to be invalid, and indeed, if it were true, the international maximum permissible levels would be far too high.

From this starting point, the Committee computed the number of bone cancers to be expected from the strontium-90 in one megaton of fission products, assuming as a worst possible case that the probability of carcinogenesis is proportional to dose, down to a level 1,000 times less than the maximum permissible level. This assumption is also uncertain. For these reasons I see no point in departing from the conclusions of the Medical Research Council report.

I have spoken so far of the biological hazards of atomic energy development. To give a balanced view, I should look at the other side of the picture and see what are the advantages to the biological sciences gained from these developments. First among these are the results obtained from the new tools of the biologist—radioactive tracers. These are produced in our atomic piles and incorporated into complex organic compounds by our Radiochemical Centre at Amersham. The use of tracer elements has changed in a major way our ideas in metabolic processes. On the old ideas, food was thought of as a fuel to be used for supplying energy or repairing wastage in tissues. It has now been realized that "the large complex molecules in food and in the less complex compounds which form them—the fatty acids, amino-acids and nucleic acids—continually participate in rapid chemical reactions. The fragments of complex molecules so released are mixed with those from other similar molecules, and with those absorbed from the alimentary canal, forming a metabolic reserve. Some of the fatty-acid molecules are completely destroyed; others of similar structure are continually formed from all kinds of substances, and in particular from carbohydrates. Similar reactions also take place with the decaying products of proteins. Thus the biological system is a vast cycle of closely inter-related chemical reactions" (Geneva Conference Papers).

The research work has also demonstrated the rapid rate of turnover of particular molecules. Thus amino-acids are assembled into proteins in about 25 min. Studies by Hevesy with radioactive iron show that of the 4 milligrams of iron present in human blood plasma, half of it leaves the circulation in about 90 min. Half of this finds its way into the bone marrow to be used for the formation of hæmoglobin in the blood corpuscles, so 16 milligrams a day are used for hæmoglobin formation. The other half finds its way to the liver and other organs. In cases of refractory anæmia the iron atoms disappear less rapidly from the plasma, so studies in anæmia are possible.

Studies using radioactive sodium show that half the sodium in the blood plasma leaves the plasma in one or two minutes. Studies with radiocarbon have shown that even the crystalline structure of the bones is in a stage of flux. It has also been possible to work out the exact metabolic pathways by which important compounds have been made. Thus the origin of every carbon atom in the complex porphyrin molecule has been determined; the pathways of formation of the blood pigment hæmatin have similarly been unravelled.

The general opinion seems to be that this new knowledge with change of concept was leading to important revisions in the search for the therapy of metabolic diseases. However, only a beginning has been made—mainly by describing the metabolic processes. We are apparently still far from understanding in detail how they work. "It remains for the future to reveal how the new knowledge can be used for the conquest of disease."

Radioactive isotopes are also used as sources of radiation for the treatment of malignant disease. Twenty years ago radium was used in quantities of several grams for radiotherapy in the so-called 'radium bombs' of the time. Radiotherapists now use radiocobalt units a thousand times as strong, using the cobalt-60 produced in nuclear reactors. We can now produce in Britain about 10,000 curies a year, and with our new reactor DIDO we shall be able to increase our annual output by 30,000 curies a year.*

Besides their use as an alternative to radium and X-ray sets, radioisotopes have a special value in therapy because of their flexibility in use. Thus radioactive sodium, which emits gamma-rays, has been injected as a solution into the bladder to treat malignancy; colloidal solutions of radioactive gold-198 or radioactive yttrium are injected into lung tumours because they stay reasonably well located and also decay rapidly with a half-life of a few days.

The use of thulium-170 and xenon-133 has been developed by Prof. W. V. Mayneord and his colleagues. These sources emit gamma-rays of low energy—85 keV. and 81 keV. The sources are easily protected, and since they are virtually point sources they can be used in localities where X-rays would be inapplicable. The human race has a great deal to gain both from the enormous potential increase in its energy resources and from the new tools which have been provided to the biologist. These new powers introduce new hazards. We must study and control these with all the power of the scientific method and so enable these benefits to be safely enjoyed.

OBITUARIES

Dr. Josephine Macalister Brew, C.B.E.

It is hard to believe that Dr. Macalister Brew is dead; for if any one adjective could have described her it would have been the hackneyed word 'vital'. Of her it was abundantly true, for there can have been few people who have lived so fully, so usefully, or so serviceably.

Her last official job was as education and training adviser to the National Association of Mixed Clubs and Girls' Clubs. But that title gives no idea of the immense scope of her interests and activities. She was not a dabbler—to her that word was an insult; she was simply a person of such energy and such catholicity of interest that she left untouched no part of the wide field of the lives of young people. She was not a simple-minded 'do-good-er'. Indeed, her unorthodox methods and rather unusual appearance sometimes frightened, even alarmed, the traditionalists. But she had a remarkable flair for getting inside the skins of the inarticulate young and then assessing what she found by the clear light of charitable reason.

For her intellectual equipment was of a quality quite unusual. She had a robust contempt for the 'starry-eyed' and the 'stuffy' (her own words); she quite simply hated the pompous and the pretentious; and for young people she had a boundless but shrewdly discriminating affection.

It was not surprising that she was worked to death. Government departments, charitable trusts, bodies as varied as the Marriage Guidance Council and the Educational Drama Association all made demands on her strength; and to none of them did she give half-measure. What she enjoyed most was not sitting around a committee table but gossiping with boys and girls in a canteen or a 'pub.', and there must be scores of them who remember this odd little figure who knew what they were thinking before they did and, more, could put it into intelligible words.

Josephine Brew made rather shop-soiled words like 'social welfare' or 'youth service' come to life. She never forgot the eternal importance of each single individual human being, and she would never allow generalizations or abstractions to hide the individual boy or girl, puzzled, uncertain, bewildered or lost. She had learning, and in her own field success—the award of a C.B.E. in the Birthday Honours only underlines the melancholy coincidence of her death—and the affection of a multitude of friends. She would prefer to be remembered as one who never lost her astringent affection for hundreds of 'crazy mixed-up kids'. John Wolfenden

Dr. J. E. Hamilton, I.S.O.

James Erik Hamilton, who died suddenly at Stanley, Falkland Islands, on April 15, a few weeks before his sixty-sixth birthday, had spent more than thirty years in the Falkland Islands and their Dependencies. After graduating at the University of Liverpool in 1913, he spent the summers of 1913 and 1914 at Blacksod Bay, Co. Mayo, on behalf of the Committee of the British Association appointed to investigate the biological problems incidental to the Belmullet whaling station. In 1914 he took his M.Sc. degree, specializing in oceanography, and occupied junior teaching posts at King's College, London, and The Queen's University, Belfast, until 1916, when he joined the R.A.M.C. as bacteriologist. In 1919 he was appointed to be Government naturalist and magistrate in the Falkland Islands, a post he occupied for thirty years until his retirement in 1949. For half this period, from 1924 until 1939, he was seconded to the scientific staff of the Discovery Investigations, and served in the ships belonging to the Discovery Committee, in the Marine Station at South Georgia, and in England. During the Second World War he was in the Falkland Islands and acted as registrar general and registrar of the Supreme Court, as well as being a police magistrate at Stanley and a temporary member of the Legislative Council. He was awarded the Polar Medal in 1943, and appointed a Companion of the Imperial Service Order in 1948.

Hamilton was a good field naturalist and was particularly interested in marine mammals and birds, on which he published a number of papers in various scientific journals. His most important published work is contained in two papers on the southern sea lion that appeared in Discovery Reports in 1934 and 1939, and formed the main part of the material for which his doctorate was conferred. During his residence in the Dependencies he had the opportunity for collecting much rare cetacean material and enriched the collections of the British Museum (Natural History) by presenting many valuable skulls and skeletons of the southern dolphins, which are generally very poorly represented in museum collections. In addition, he sent home large collections of skulls from several species of southern seals, specimens which are of unusual value as they are accompanied by very full data. After his retirement in 1949 Hamilton continued to reside in the Falkland Islands, where he carried on with his collecting and zoological work. He was particularly concerned for the preservation of the stocks of whales, which he considered were being dangerously over-fished, and stated his views in several outspoken contributions in *Nature* during recent years.

Hamilton was of medium height and stocky build, and enjoyed the rough conditions of life that he experienced on many of his expeditions in the course of the Discovery investigations, as well as during his work as Government naturalist. The latter took him into some very remote places in company with the sealers and whalers, among whom he had many friends. In 1931 he married Miss Rose Purdie, who survives him, and to whom we extend our sympathy.

L. Harrison Matthews

Dr. J. F. Allan

Dr. J. F. Allan, superintendent of the Ship Division, National Physical Laboratory, collapsed and died on June 8 while sailing on holiday at Aldeburgh, Suffolk.

James Foggo Allan was born on July 23, 1904, at Brechin, Angus, the son of a Church of Scotland minister. He was educated at Dumbarton Academy and the University of Glasgow, and served an apprenticeship with William Denny and Bros., Ltd., the

Dumbarton shipbuilders. He held the Sir William White Research Scholarship of the Institution of Naval Architects during 1927–29. In 1948, he was awarded the degree of D.Sc. by the University of Glasgow for his pioneer work in the development of ship roll stabilizers, now a familiar feature of many passenger ships.

From 1926 until 1948 he was on the staff of the ship model experiment tank at Dumbarton; during the last six years of this period he was in charge of the department. In 1948, he was appointed superintendent of the Ship Division of the National Physical Laboratory.

Since Dr. Allan's appointment, the Division has considerably widened its range of activities and, under his enthusiastic guidance, the new National Physical Laboratory Ship Hydrodynamics Laboratory at Feltham was planned and construction begun. In this Laboratory the work of the Division in carrying out experiments for ship-builders on new designs and in basic research into the hydrodynamic problems of ships will be continued in the ways in which he so firmly believed.

Dr. Allan was an international figure in the world of naval architecture; he served on many committees and published a number of notable papers. He was a member of Council of the Institution of Naval Architects and of the Scholarships and Publications Committee. He took a leading part in the organization of the triennial International Towing Tank Conference (formerly International Conference of Ship Tank Superintendents), serving on the Conference Standing Committee, and was an active member of several British Shipbuilding Research Association technical committees, acting as chairman of the Propulsion Sub-Committee. The papers which Dr. Allan published dealt with many different ship design problems, including scale effects on propellers and shaft supports, the resistance of barges, hull forms for drifters, and the comparison of ship-trial results with model predictions. His paper on "The Stabilization of Ships by Activated Fins" was awarded a premium of the Institution of Naval Architects in 1945, and that dealing with "The Effect of Roughness on Ship Resistance", which he presented jointly with Mr. R. S. Cutland to the North East Coast Institution of Engineers and Shipbuilders last year, gained the M. C. James Medal.

In addition to the work described in these papers, Dr. Allan was actively engaged during the Second World War on the development of a high-speed hydrofoil-supported torpedo boat, and at the time of his death was vigorously developing new ship features. His loss will be keenly felt, not only at the National Physical Laboratory but also in shipbuilding circles throughout the world. It is particularly tragic that his services will not be available at the time when the new ship research laboratory, one of the most comprehensive in the world, is to be put into operation.

NEWS and VIEWS

Royal Society of Edinburgh: New Fellows

The following have been elected Honorary Fellows of the Royal Society of Edinburgh: Dr. H. J. Bhabha, chairman, Atomic Energy Commission of India, Bombay; Sir Alexander Fleck, director, Imperial Chemical Industries, Ltd.; Dr. R. J. Heim, director, Museum of Natural History, Paris; Prof. Olaf Holtedahl, professor of historical geology in the University of Oslo; Sir Rudolph Peters, professor emeritus of biochemistry in the University of Oxford; Prof. C. E. Tilley, professor of mineralogy and petrology in the University of Cambridge.

Mathematics in the University of Manchester:
Prof. G. J. Kynch

Prof. George James Kynch, at present professor of applied mathematics in the University College of Wales, Aberystwyth (see *Nature*, 169, 266; 1952), has been appointed to the new chair in mathematics in the faculty of technology in the University of Manchester. Prof. Kynch graduated at the Imperial College of Science and Technology with honours in physics in 1935. He then read for honours in mathematics and obtained a first-class degree in the following year, together with a University prize and research scholarship. He obtained the Ph.D. and the diploma of the Imperial College in mathematics in 1939. His research on valence theory and magnetism at the Imperial College during 1936–40 was under the direction of Dr. (now Sir) William Penney. Dr. Kynch was appointed to a lectureship at the University of Birmingham under Prof. R. E. Peierls, and also undertook part-time research as a member of the Ministry of Supply "Tube Alloys" team at the University of Birmingham. Since 1952 he has been professor of applied mathematics in the University College of Wales, Aberystwyth. Prof. Kynch will take up his duties at Manchester in September.

Chemistry at Auckland University College:
Prof. D. R. Llewellyn

Dr. D. R. Llewellyn, who has recently been appointed professor of chemistry at Auckland University College, New Zealand, graduated with first-class honours in chemistry from the University of Birmingham in 1941. During 1941–44 he carried out research under the direction of the late Prof. F. Simon at Oxford, where he obtained the D.Phil. degree, and in the following year he went as a research assistant in the Cavendish Laboratory, Cambridge. His university teaching work on a full-time basis started in the University College of North Wales in 1945, when Prof. E. D. Hughes held the chair of chemistry at Bangor. Llewellyn was a lecturer there until 1949, when he was appointed to an Imperial Chemical Industries fellowship, tenable at University College, London, where he became a lecturer in 1952.

Dr. Llewellyn's published work has dealt with the chemistry of uranium, the preparation of stable isotopes by fractional distillation, and the use of various tracers in the study of the mechanism of reactions. In 1952, he was awarded the Weizmann Prize for a paper on the separation of isotopes, published in collaboration with Drs. I. Dostrovsky and J. Gillis. He has shown marked ingenuity in the design and construction of physical apparatus, especially large-scale distillation columns of high efficiency. His natural aptitude in this direction was, no doubt, fostered when he worked as a physical chemist in the schools of physics of Oxford and Cambridge, and it is now a very highly developed part of his equipment. His work is characterized also by great versatility in the use of isotopes, particularly in the elucidation of the course of chemical reactions in the inorganic, organic and biochemical fields. These activities are well integrated, and they will be brought to bear most effectively in his new post as professor of chemistry and director of the Laboratories at Auckland University College.

British Museum (Natural History): The Neolithic Revolution

In the Central Hall of the British Museum (Natural History) in South Kensington the series of displays illustrating the evolution of man and his culture has been extended by the arrangement in Bay 4 of a new exhibit on the "Neolithic Revolution". The exhibit deals primarily with the biological foundations of Neolithic culture: Panel 1 with the beginnings of plant cultivation; Panel 2 with the domestication of animals (dogs, goats, sheep, cattle and pigs); Panels 3 and 4 with related activities, including hunting and fishing with the aid of new devices, the mining of flint, the manufacture and trading of polished stone axeheads, their use in the clearance of forest for agriculture, the construction of permanent dwellings, the formation of villages, and the development of specialized crafts such as basketry, the making of pottery, and the spinning and weaving of plant and animal fibres for use in clothing. The probable relation of Neolithic religious ideas to agriculture is indicated. Specimens shown on the panels have been drawn from a wide range of Neolithic sites, including Jericho, Jarmo (Iraq), and others in Egypt, Sudan, Switzerland, Denmark and Britain—notably Windmill Hill (Wiltshire), Maiden Castle (Dorset), Church Hill, Findon (Sussex), and Grimes Graves (Norfolk). The first panel includes examples of some of the earliest cultivated plants (einkorn and emmer wheat, flax and the Celtic bean) recently grown under Neolithic conditions on a private experimental plot in Kew Gardens. The exhibit demonstrates some of the contributions of the natural sciences (particularly botany, zoology and geology) to archæology; and it indicates the biological interest of many of the findings of archæological research.

James Sowerby (1757–1822)

Another new exhibit has also been arranged in Bay 4 of the Central Hall of the British Museum (Natural History) to commemorate the work of James Sowerby, the founder of a family whose members have been distinguished as authors and illustrators of natural history works, and who between them wrote and illustrated more than seventy works on botany, zoology and palæontology. James Sowerby, born in 1757, studied with the marine painter, Richard Wright, and was later employed by William Curtis to make drawings for the *Flora Londinensis* and the *Botanical Magazine*. Sowerby, however, is probably best known for his plates to the "English Botany" (1790–1814), the text of which was written by Sir J. E. Smith, though the work is generally referred to as "Sowerby's English Botany". Sowerby was also deeply interested in mineralogy, and his "Mineral Conchology of Great Britain" (1812–46) is a work of considerable historical interest. An unfinished zoological work, "The British Miscellany" (1804–6), contains as its first plate a figure of 'Sowerby's Whale', described and figured by the artist from a specimen found near Elgin in Scotland. The Museum possesses the original water-colour drawings for the "English Botany", more than 2,500 in number, the originals of the "English Fungi" (1795–1815), and the drawings to illustrate J. Dickson's "Fasciculus Plantarum Cryptogamicarum Britanniae", Fasc. 2–4 (? 1789–1801). A selection of these, together with some of Sowerby's published works, are on exhibition, and give some indication of the great talent and wide scientific interests of this famous artist-naturalist.

Illinois Journal of Mathematics

The pressure on scientific periodicals is still so great that new journals are bound to be welcome, except possibly to those librarians to whom space is already a problem. The new *Illinois Journal of Mathematics*, published by the University of Illinois, Urbana, has a strong editorial board consisting of R. Baer (Frankfurt-am-Main), J. L. Doob and A. H. Taub (University of Illinois), G. W. Whitehead (Massachusetts Institute of Technology) and O. Zariski (Harvard). It will publish research papers in pure and applied mathematics, written in English, French, German or Italian. A volume of four quarterly parts will cost 9 dollars, but there is a reduced subscription available to members of the American Mathematical Society. The first part (March 1957) contains ten papers in its 114 pages; most of these are fairly short, with an algebraic and topological flavour, but there is a first instalment (50 pages) of a three-part memoir on Markoff processes and potentials. It will be of interest to see whether the new journal can attract good work on applied as well as on pure mathematics.

British Birds

Early in 1907 H. F. Wetherby persuaded a number of friends and ornithologists to support a monthly magazine devoted entirely to the study of British birds. The fiftieth anniversary of *British Birds* is now being celebrated, and its latest issue (50, No. 6; June 1957) tells the story of its steady rise in influence and quality until, as the messages from many countries indicate, the journal is now recognized throughout the world as an outstanding contribution to ornithological literature. Greetings which must give particular pleasure to the editors include that from Tom Harrisson, curator of the Sarawak Museum, and Prof. G. P. Dementiev, of the University of Moscow, a confessed admirer of *British Birds* for thirty years. The journal has always been noted for the quality of its plates, and this birthday issue contains a reproduction of a painting of collared doves (*Streptopelia decaocto*) by R. A. Richardson which is worthy of its predecessors; so, too, are some photographs by, among others, Eric Hosking, James Alder and J. H. Drenth. *British Birds* is to be congratulated on its first half-century of existence; and may look forward to the second half-century with confidence.

Zoological Libraries

Zoological libraries are the subject of the sixth in the series of publications on Library Resources in the Greater London Area, issued by the Library Association (pp. ii+21. London, 1957. 4*s*. 6*d*.). Compiled by A. C. Townsend and G. B. Stratton, the pamphlet deals chiefly with the British Museum

(Natural History), the libraries of the Zoological Society of London, of the Commonwealth Institute of Entomology, the Linnean Society of London, the Royal Entomological Society and the Horniman Museum and Library, though there is a brief note on other sources also, such as the holdings of the Science Museum Library and the Patent Office Library. The British Museum (Natural History) Library, which probably contains the largest collection of zoological books and periodicals in Britain, is described in some detail by Mr. Townsend and that of the Zoological Society by Mr. Stratton. The authors are to be congratulated on a most useful guide to sources of zoological literature, the value of which is enhanced both by the inclusion of references to other accounts of particular libraries and to the main bibliographies of zoology. There is an index to persons, institutions and serials.

Christian Faith and the Freedom of Science

Dr. R. Hooykaas, professor of the history of science at the Free University, Amsterdam, is the author of a recent pamphlet on "Christian Faith and the Freedom of Science" (Philosophia Libera. Pp. 24. London: The Tyndale Press, 1957. Published for the Research Scientists' Christian Fellowship. 1*s.* 6*d.*), in which he points out that science is stifled whenever men cherish preconceived ideas which they refuse to submit to test, whether under totalitarianism, secular or clerical, or whenever a well-meaning piety exalts secondary standards of authority to a place that belongs only to God. Prof. Hooykaas contends that Scripture, rightly approached, liberates the mind from all these constraints. Reviewing the several threats to the freedom of science, he cites Calvin as an example of a man made free from traditional beliefs and unhampered by an elaborate theory of inspiration. He argues that confidence in the possibilities of science and in the freedom of thought, as well as self-restriction in theorizing and obedience to the dictates of Nature, are the necessary consequences of a truly liberal religion, and illustrates his argument by a brief historical survey of relations between science and religion in the Middle Ages, in the Reformation period and in the seventeenth century. The Puritan scientists of the seventeenth century regarded science as an ally of true religion, and Prof. Hooykaas points out that the educational ideals of the Enlightenment and those of the English Puritans were almost the same, the Enlightenment being considered as a secularized puritanism. The spirit of the Reformation and the spirit of science have much in common.

Electronic Image Devices in Microscopy

Reports on the use of electronic image converters, television cameras and flying-spot scanning systems in microscopy have appeared from time to time; but it cannot be said that these methods have been responsible for any spectacular advances. Their theoretical possibilities are considerable, but as yet the practical results have been disappointing. Despite the high cost and complexity of the apparatus, electronic 'noise' and other imperfections usually reduce the image quality to below that obtainable by simple visual or photographic methods. A very attractive feature is the possibility of image intensification, that is, the ability to present a bright picture on a screen even though the object itself may be very weakly illuminated. This is most important in ultra-violet microscopy, since ultra-violet light damages living cells. A remarkable ultra-violet colour-translating television microscopy has recently been developed at the Rockefeller Institute, New York, by V. K. Zworykin, F. L. Hatke and C. Berkley. The instrument recalls the earlier photographic one described by E. H. Land and his collaborators (*Science*, 109, 371; 1949), in which the specimen was illuminated in turn by three monochromatic bands of ultra-violet light, and three photographic negatives were made. After processing at high speed in a special machine, these negatives were projected simultaneously through red, green and blue filters on to a viewing screen. In this way differences in ultra-violet spectral absorption were 'translated' into differences in visible colour. It was claimed that by a proper selection of illuminating wave-lengths colour differences could be related to variations in chemical composition, particularly with regard to proteins and nucleic acids. The new system eliminates photography by employing a closed-circuit colour television receiver, so that its action is virtually instantaneous and it is possible to view cells in motion. No results of any biological importance have yet been reported with the original colour-translating microscope, and it remains to be seen whether the new instrument will turn out to be simply another brilliant technological achievement. Nevertheless, there is little doubt that the next generation of microscopists will use electronic devices almost as freely as photography is used to-day, and this pioneer work must be followed with cautious and sympathetic interest.

Geological Resources of Britain

At a meeting of the Parliamentary and Scientific Committee on May 14, a discussion on British geological resources was opened by Sir William Pugh, director of the Geological Survey and Museum, who described the work of the Geological Survey of Great Britain in relation to supplies of coal, iron ore and water. He stressed the dependence of development and exploitation of these and other natural resources on the up-to-date, large-scale geological maps and memoirs which it is the primary function of the Geological Survey to provide. Mr. P. T. Cox, of the British Petroleum Co., Ltd., who spoke next, dealt with the oil resources of Britain, and particularly the results of recent prospecting, which, at present, is concentrated principally in the Eakring area of Nottinghamshire, where the ultimate production of some 10 million tons is probably the limit. Mr. H. E. Collins, of the National Coal Board, paid tribute to the help of the Geological Survey in the Board's drilling programme. This programme had already provided resources estimated at more than 4,000 million tons through the construction of fifteen new collieries and the reconstruction of some 200 existing collieries. Sir Arnold Waters dealt with problems of water supply, ironstone, and sand and gravel supplies, pointing out that the demand for sand and gravel had already considerably exceeded the expectations of the Advisory Committee. In the discussion that followed, Mr. Collins said that there are sufficient proved coal resources for current development, and further proving would continue around the fringes of coalfields now being exploited. Sir Arnold Waters said that improved land drainage and the great impermeable urban areas were affecting the average rate at which water reaches the underground water-tables. Many areas, including London, are over water-tables which are known to be dropping, but London depends only in part on its underground supplies. Overground supplies have been developed, because the rate of consumption from underground supplies has exceeded the available quantities of water. Sir William Pugh said that a deep borehole drilled at Burford by the Geological Survey entered Upper Coal Measures at about 1,100 ft., and they were proved to a thickness of 2,660 ft. It is not known whether they are underlain by productive Coal Measures because the borehole was stopped by technical difficulties at 3,767 ft. Within the comparatively small confines of the British Isles there is a remarkable range of phenomena of geological interest and of materials of economic importance.

Florigenic Hormone in the Strawberry

C. Sironval has given a comprehensive account of observations and experiments on the inception of flowering in an ever-flowering strain of strawberry, *Fragaria vesca* L. var. *semperflorens* Duch. (C.R. de Recherches, Trav. du Centre de Recherches des Hormones Végétales, No. 18, 9–229, Feb. 1957, Bruxelles). The author has found that during the course of development from the seed, the initial vegetative phase is followed by a second distinctive physiological phase, designated as the *photophase*. During this phase, the conditions essential for the onset of flowering are long days and a fluctuating daily temperature—warm days and cold nights. This period of development can be distinguished by characteristic features in leaf morphology and coloration. Once induced, the flowering phase persists until the death of the plant. The characteristic development of the photophase is immediately arrested by exposure to short days. Sironval's experimental observations indicate clearly that the photophase is the period when the specific transformations which prepare the way for flowering take place. In particular, he has directed attention to the fact that changes in the metabolism of the chlorophylls are especially distinctive during this phase. During exposure to long days he finds that there is a relative lowering of the amount of chlorophyll *b*. The accumulated evidence is held to be indicative of a correlation between the chlorophyll metabolism, environmental conditions—in particular, the day-length—and the inception of flowering. When a crude extract of the unsaponifiable fraction of leaves from flowering strawberry plants—and here particular interest may attach to vitamin E (in low concentrations) and a sterol (in high concentrations)—was applied to the meristems of plants not yet in the flowering phase, cell division was activated in the axial region of the meristem, this being characteristic of the transition to the flowering state.

Australian Biochemical Society

The Australian Biochemical Society was founded at the time of the meeting of the Australian and New Zealand Association for the Advancement of Science in Melbourne in August 1955. At that meeting Dr. M. R. Lemberg was elected as the first president, and a constitution was adopted. The first annual conference was held in Sydney in May 1956 and the second annual conference was held in Melbourne during June 5–7. At this latter meeting fifty-seven papers were presented, and abstracts of these papers will be published in the *Australian Journal of Science*. The present president is Prof. V. M. Trikojus, Department of Biochemistry, University of Melbourne, and the hon. secretary is Dr. F. D. Collins, Department of Biochemistry, Australian National University.

Announcements

Dr. Å. Vedel Tåning, director of the Danish Fisheries and Oceanographic Research Institute, has been elected an honorary member of the Marine Biological Association of the United Kingdom.

The following have recently been elected to office in the Institution of Electrical Engineers for the session 1957–58: *President*, T. E. Goldup; *Vice-Presidents*, S. E. Goodall, Dr. Willis Jackson, G. S. C. Lucas, Sir Hamish D. MacLaren, C. T. Melling; *Honorary Treasurer*, Viscount Falmouth.

The recently published Yearbook of Forest Products Statistics, 1956 (pp. vi+170. Rome: Food and Agriculture Organization of the United Nations; London: H.M. Stationery Office, 1956. 12*s*. 6*d*.; 2.50 dollars), is the tenth issue of this report, covering details of world forestry output, trade and consumption compiled from information supplied by more than 120 countries throughout the world.

A "Joining of Metals" conference on "The Wetting and Spreading of Liquid Metals on Solid Metal Surfaces", organized by the Department of Industrial Metallurgy in the University of Birmingham, is to be held at the University of Birmingham on September 25. Further details and enrolment forms can be obtained from the Secretary to the Department.

A series of eight lectures on operational research and cybernetics in industry has been arranged by the Department of Operational Research and Cybernetics of the United Steel Companies, Ltd., in co-operation with Dr. G. Lawton, principal of the Sheffield College of Commerce and Technology, to be presented during October and November on Wednesdays from 2.30 to 4 p.m. The course is addressed to senior management, and is likely to be followed in 1958 by a longer and more detailed course addressed to practitioners who may be appointed to carry out this type of work. The course will be introduced by R. S. Gander, development manager in the Department of Operational Research and Cybernetics, and the later lectures, also delivered by members of the Department, will be on "Queues", by K. D. Tocher, research manager; "Operational Research Models", by R. S. Gander; "Operational Research Machines", by D. G. Owen, computer applications manager; "Processes involving Chance", by K. D. Tocher; "Information", by P. G. Lucas, operations manager; "Production Control" and "Cybernetics", by Stafford Beer, head of the Department. Further details can be obtained from the College of Technology, Sheffield, 1, or the Department of Operational Research and Cybernetics of the United Steel Companies, Ltd.

Addendum. The symposium on "Microchemistry", to be held at the University of Birmingham under the auspices of the Society for Analytical Chemistry, and announced in *Nature* of June 29 (179, 1337; 1957), will take place during August 20–27, 1958.

INITIATION AND GROWTH OF EXPLOSION IN SOLIDS

A CONSIDERABLE amount of work has been carried out in recent years on slow and fast reactions in solids, and in particular on explosive solids. In order to bring this work together and to review the present position of this field of research, a discussion arranged by Dr. F. P. Bowden for the Royal Society was held on May 30 in the Society's rooms at Burlington House. The discussion was international in character, and there were contributors and visitors from Australia, Belgium, France, Great Britain, Sweden, Switzerland, the United States and the U.S.S.R. The programme was an ambitious one, and by concentrating only on essential points and the more recent advances, it was possible to fit in twenty-two prepared papers. The discussion on these papers was lively and valuable, and many new points were brought out at this stage. There was some time for informal discussion. The papers and the discussion will be published in the *Proceedings of the Royal Society*.

The discussion fell into two parts. The first, on the initiation of explosion, included some work on the slow decomposition of a number of explosive materials. The second part dealt with the growth of reaction to explosion, and with low-velocity detonation. The process of high-velocity detonation was not considered since this had been dealt with in a discussion in 1951 organized by Sir William Penney.

In opening the discussion, Dr. F. P. Bowden summarized the different ways in which reactions in solids may be initiated. These are: (1) by heat which raises the material to the ignition temperature; (2) by shock; this can act by (*a*) an adiabatic heating of compressed gas spaces; (*b*) a frictional hot spot on the confining surface or on a grit particle; (*c*) intercrystalline friction of the explosive itself; (*d*) viscous heating of the explosive at high rates of shear; (*e*) heating of a sharp point when it is deformed plastically; (*f*) mutual reinforcement of gentle shock waves; (3) by ultrasonic vibrations; (4) by electrons, α-particles, neutrons and fission fragments; (5) by light of sufficient intensity; (6) by electric discharge; (7) by 'spontaneous' ignition of a growing crystal.

Dr. Bowden emphasized the importance of using modern physical methods to follow reactions in solids. The combined use of electron diffraction and electron microscopy by Dr. J. Sawkill has shown that it is possible to follow the collapse of the lattice during decomposition in materials such as silver azide to give the final product silver. With the aid of the scanning electron microscope, J. A. McAuslan has also followed the early stages in the decomposition of silver azide. There is evidence that reaction can occur preferentially not only on the surface of the crystal but also at defects within it. This leads to a cracking and splitting of the crystals along preferred directions. This break-up has also been observed by S. K. Deb in his experiments on the decomposition of P.E.T.N. crystals by a light flash. The disintegration of crystals into small blocklets, which may be about 10^{-5} cm. across, is important both in the early phase and also, as shown by Evans and Yoffe, in the growth of burning to detonation.

Some puzzling observations made by G. T. Rogers on spontaneous explosions were also discussed. During the growth of crystals of β-lead azide and mercuric azide in solution, an explosion may take place for no apparent reason. Dr. J. V. R. Kaufman (United States) said that α-lead azide also explodes spontaneously during the initial stages of growth in solution. There is at present no adequate explanation for these observations, although some suggestions have been put forward. Dr. Z. V. Harvalik (United States) thought that the heat of aggregation of small crystals could be an important factor.

Thermal decomposition and explosion. The growth of explosion from the point of initiation is a critical process. If the size of the nucleus of decomposition or 'hot spot' is greater than about 10^{-3} cm. in diameter, then for a number of explosive materials there is a chance that the reaction will grow to explosion. Thermal factors determine this growth, and it is necessary for the rate of heat liberation to be greater than the rate of heat loss. Two problems in thermal explosion theory were analysed by Dr. G. B. Cook. The first was concerned with a slab of solid explosive, where one face is placed in contact with a constant-temperature bath. From his calculations, he obtained a relation between ignition time and the temperature of the bath and the initial temperature of the explosive. The interesting point that emerges is that for a given initial temperature the order of thermal sensitivity can change with the bath temperature. The examples given by Dr. Cook are 'Tetryl', P.E.T.N. and R.D.X.

A paper on the thermal decomposition of silver azide by Drs. B. E. Bartlett, F. C. Tompkins and D. A. Young was read by Dr. F. C. Tompkins. The decomposition was followed both above and below the crystallographic transformation at 190° C. Dr. Tompkins stressed the importance of the interfacial reaction at the product–reactant interface. Activation energies for the reaction were given. Below 190° C. this is 44 kcal./mole and above that point it is 31 kcal./mole. These authors also presented some results on the ionic and photoconductance of silver azide.

Initiation by shock. Three papers were presented on the ignition of explosive materials by the compression of gas spaces. Dr. C. H. Johansson (Sweden) considered the case of liquid materials. He showed that in a number of cases a foam is produced during impact. This means that the disintegration of the liquid into tiny droplets is important. He also discussed other experiments on the initiation of explosion in liquids.

To obtain accurate values for the energy required to ignite a number of sensitive materials, Dr. G. J. Bryan and Dr. E. C. Noonan (United States) and J. I. Evans and Dr. A. M. Yuill (Ardeer) have constructed compression apparatus of advanced design. With this apparatus it is possible to vary the compression ratio and the time of compression, and it is also possible to record the light from the burning explosive by means of a photomultiplier. In the apparatus described by Dr. Noonan the gas pressure could also be read as a function of time.

Prof. K. K. Andreev (U.S.S.R.) in a paper entitled "Some Considerations on the Mechanism of Initiation of Detonation in Explosives" gave a résumé of his own and other Russian work. He also emphasized the importance of the disintegration of the solids. In particular, he considers that the initiation of detonation is due mainly to the sudden rise in pressure when a suspension of the solid explosive which is formed in the gaseous products of burning explodes. He also discussed Landau's ideas on the effects of turbulence at the burning front of liquids and the mechanism by which suspensions might be formed. The work discussed by Prof. Andreev is relevant both to the initiation of explosion and to the growth mechanism to detonation.

Structure and stability of inorganic azides. The marked difference in the decomposition behaviour of materials such as potassium azide and silver azide has led B. L. Evans to attempt to correlate the explosive sensitivity of these compounds with their crystal structure. He considered the azides and the isoelectronic cyanates, thiocyanates and fulminates. Thus in the case of azides the important factor to consider is the ionization potential of the metal compared with the electron affinity of the azide radical. This determines both the extent to which the valence electron is under the influence of the metal and the unit cell dimensions of the metallic azide. From the results that are available, Evans concludes that the explosive sensitivity is dependent on the ionization potential of the metal forming the azide. The ionization potential of the metal will also determine some of the physical properties such as the melting point, and it can be used to interpret results on photoconduction, thermal decomposition and photochemical decomposition.

Initiation by light. Prof. J. Eggert and his colleagues (Switzerland) found some time ago that a number of sensitive materials could be ignited by a light flash of sufficient intensity. In presenting the Cambridge work, J. A. McAuslan discussed his own experiments on the ignition of lead styphnate, and that of G. T. Rogers on silver azide. A thermal mechanism has been postulated for the initiation of explosion, in which the absorbed light energy is converted into heat in a very thin layer near the surface. In the case of silver azide, however, this assumption has been questioned by B. L. Evans. His results on sensitized ignitions suggest that the primary action of the light is photochemical, but that propagation of reaction is thermal. A necessary condition for this growth to explosion is the formation of a molten layer on the surface. It is in the molten state that there is sufficient mobility of the azide radicals to give rise to explosive reaction.

Dr. A. C. McLaren and Dr. G. T. Rogers described their results on the absorption spectra (visible light and ultra-violet) and photoconduction of single crystals of silver azide. They explained their results on absorption spectra in terms of the formation of excitons. The photocurrent is due to the dissociation of these excitons into free electrons and positive holes. These results support the suggestion, made earlier, that during the ignition of silver azide by light the initiation is photochemical in nature.

There was a vigorous discussion of the work presented in these last two sections. In this discussion Dr. J. W. Mitchell outlined his views on the action of metal particles as electron-traps in silver azide. Dr. P. Gray gave his views on the use of enthalpies of formation in describing the behaviour of azides.

Decomposition and explosion by ionizing radiations. The slow decomposition of a number of materials by X-rays was considered by Dr. J. V. R. Kaufman (United States) and by Dr. J. M. Groocock. The only material which explodes during irradiation is nitrogen iodide. This was discussed by Dr. F. P. Bowden. In particular, he showed how McLaren's results on the explosion of nitrogen iodide by α-particles could be shown to be the result of the removal of ammonia from the surface of the nitrogen iodide by the α-particles. Dr. Bowden also discussed some recent experiments by Deb, Evans and Yoffe on the use of the radioisotope of silver as a means of introducing cadmium into crystals of silver azide.

The growth of explosion formed the subject of the second part of the discussion. An introductory paper by Dr. A. D. Yoffe on the work in Cambridge showed that the stages following on initiation of reaction are: (1) growth of reaction to an accelerating burning; (2) transition from burning to low-velocity detonation; (3) propagation of low-velocity detonation. Very little is known about stage (2). The growth of reaction to burning depends on thermal factors. The differences in behaviour of azides and the more complex materials during this stage can be explained in terms of the differences in the possible modes of decomposition of these materials.

There is no adequate theory to explain the propagation of low-velocity detonation in solids. Factors such as the compression of trapped gas, intercrystalline friction and break-up of the solid ahead of the flame front are important. They do not, however, explain all the results that are available. For example, Deb has found that a low-velocity detonation can be propagated through a single crystal of P.E.T.N. containing no obvious air pockets. The formation of a molten or of a vaporized layer is probably important in the growth to explosion and in the setting up of low-velocity detonation.

High-speed photographic techniques were used by Dr. G. P. Cachia and Dr. E. G. Whitbread, by Prof. M. A. Cook (United States), and by Dr. C. W. Lampson and Dr. R. J. Eichelberger (United States) to follow the sympathetic detonation of solid explosives by shocks propagated across an air-gap or through a metal strip. Detonation in the receptor charge does not always occur at the surface in contact with the metal wafer, but initiation may occur within the body of the receptor. A ciné-film, prepared at the Aberdeen Proving Ground, United States, illustrated this effect. This film was remarkable for its clarity and showed a high degree of technical competence. It was much appreciated by all present.

The detonation of pentolite in water by a remote spherical primer was discussed by Dr. C. H. Winning. Other papers presented were: studies on the oxidation induced by ultrasonic radiation on a solid system of lauryl aldehyde and potassium chlorate by Dr. F. A. H. Rice and Dr. D. Levine (United States); the ignition of primary explosives by electric discharges by Drs. R. M. H. Wyatt, P. W. J. Moore, G. K. Adams and J. F. Summer; some kinetic problems of fast reactions by Dr. R. B. Parlin and Prof. H. Eyring (United States); and lamellar twinning and decomposition in potassium azide and sodium azide by Dr. R. W. Dreyfuss and Dr. P. W. Levy.

This discussion has shown that a good deal is known about the initiation of explosion in solids. In his summing up, Dr. F. P. Bowden said there is sufficient data now available for us to argue about the electronic structure and possible modes of decomposition of a number of materials. There are, however, a number of outstanding problems. We know very little about radiation damage in solid explosives. There is also the question of spontaneous explosions in solids. So far as the growth of explosion is concerned we need more experimental results. In particular, there is even a lack of data of quantities such as thermal conductivity and specific heat. The disintegration and break-up of solids ahead of the reaction zone have been stressed by a number of workers. The formation of a molten zone and its importance, both in the growth of explosion and in low-velocity detonation, have been mentioned. With the development of new apparatus, and with the techniques now available, we may expect a rapid advance in the near future on this problem of the growth of reaction to detonation.

A. D. Yoffe

RECENT ADVANCES IN HIGH POLYMER PHYSICS

A CONFERENCE on "Rheology of Elastomers" was held by the British Society of Rheology during May 29–31 at the British Rubber Producers' Research Association, Welwyn Garden City.

Equilibrium properties of rubberlike materials. In an introductory talk, Dr. L. R. G. Treloar (British Rayon Research Association) said that in the main the properties of rubber and of other polymeric materials in the highly elastic or 'rubberlike' state are now well understood. The stress and birefringence of rubber subjected to different types of finite strain at various temperatures are described to a good first approximation by the 'kinetic theory', a relatively simple molecular theory which treats of the changes of configurational entropy and molecular orientation in a deforming network composed of flexible long-chain molecules. Reviewing the shortcomings of the theory (in the Gaussian approximation), Dr. Treloar said that for simple elongations in the range 150–500 per cent, the discrepancies between the theoretical and observed stress–strain relations have so far not received satisfactory 'molecular' explanation.

A crucial test of the applicability of the kinetic theory to polymeric materials is furnished by the prediction that the rigidity modulus should increase linearly with the absolute temperature and with the concentration of junctions in the network. By using gelatin gels specially prepared to give junctions which are substantially unaffected by temperature changes, P. R. Saunders and A. G. Ward (British Gelatine and Glue Research Association) found that the rigidity modulus did increase linearly with temperature in the range 0°–60° C. and at a rate comparable with that required by the theory. Data both from gel rigidities and from dilute solution viscosities at different *p*H indicated that differences in the rigidities of ordinary gelatin gels must be attributed to differences in concentration and strength of network junctions, rather than to differences in molecular chain 'stiffness'.

Improved techniques for conditioning filaments of natural rubber so as to yield a more accurate attainment of thermodynamic equilibrium (required for comparison with the kinetic theory) were described by P. Thirion (Institut Français du Caoutchouc). For filaments held at constant extension in the range 0–30 per cent, reversibility of tension–temperature cycles (20°–60° C.) was attained to within 0·05 per cent. A new derivation was given of Gee's formula for determining the coefficients of change of entropy and internal energy with change of extension at constant volume and temperature. From the data, the corresponding coefficients at constant pressure and temperature were determined with accuracies of the order 0·03 gm./cm.^{2}/deg. C. and 10 gm./cm.^{2}, respectively.

When the individual 'links' of long-chain molecules in a network have anisotropic optical polarizability, the network becomes birefringent when stressed. According to the kinetic theory, which assumes that no crystallization is present, the stress (for simple elongation) should be proportional to the magnitude of birefringence, and the constant of proportionality, or 'stress–optical coefficient', should not depend on the concentration of network junctions. Dr. D. W. Saunders (British Rayon Research Association) presented data obtained at temperatures above the crystal melting points which agreed with both these theoretical predictions in the case of cross-linked natural rubber and gutta percha. For polythene and polymethylene, however, the stress–optical coefficient decreased with increase of junction concentration; this was satisfactorily accounted for by extending the theory to apply to short-chain networks, and the data indicated that these two polymers had comparatively stiff chains. The problem of giving a strict definition of chain stiffness was considered.

The creation and loss of junctions in a network deformed from its unstressed state were considered in a theoretical paper by Dr. J. Scanlan (British Rubber Producers' Research Association). Tobolsky and co-workers have postulated a form of strain-energy function which would be obtained if the actual network behaved as if it were two independent networks, each of which obeyed the kinetic theory. Dr. Scanlan showed that, in the case in which junctions are created but none is lost, this postulate can be justified, but in the case in which one junction is lost for every one created (in the deformed state), the postulated strain–energy function is correct in form but contains coefficients which must be corrected. Two arguments were presented—one based on the network theory of James and Guth, and the other on a corrected form of a theory given by Scott and Stein.

Elastic recovery, flow and stress relaxation. A striking demonstration of high elastic recovery in a liquid was given by Dr. A. S. Lodge (British Rayon Research Association), who poured a liquid (containing about 5 per cent aluminium laurate in paraffin) out of a bottle; on sharply cutting the liquid stream with scissors, the upper part of the stream snapped back into the bottle. Dr. Lodge has applied the network theory of James and Guth and the theory of relaxing networks of Green and Tobolsky to the problem of elastic recovery in solutions of long-chain molecules; for the instantaneous recovery following steady laminar shear flow, the latter theory predicts an unexpected expansion in directions normal to the previous flow lines. The suggestion that this might contribute to the diameter increase commonly observed when polymer solutions and melts are extruded from tubes of circular cross-section gave rise to considerable discussion, and alternative explanations, also in terms of elastic recovery, were mentioned by Dr. P. Clegg (Imperial Chemical Industries, Plastics Division). Dr. Clegg's data for molten polythene showed that at low flow rates the diameter increase did not depend on tube length (in agreement with Dr. Lodge's theory) but did depend on tube length at higher flow rates when the transit time through the tube became comparable with the stress relaxation periods of the melt. In this case, the melt was presumably 'remembering' its convergent flow at the entry to the tube. The main part of Dr. Clegg's paper dealt with still higher flow rates, when marked irregularity occurred in the extruded filament. By observation of the motion of embedded particles and of coloured parts of the polymer, Dr. Clegg established that the cause of the irregularity lay in the conditions of flow in the region of entry to the tube; a motion film was shown which clearly demonstrated very marked disturbances of flow in this region. Independent measurements of melt elastic properties suggested that polymers for which the irregular flow sets in at lower shear stresses (or rates) have longer stress relaxation times.

Unoriented polymers crystallize if left long enough at suitable temperatures; crystallization can be accelerated by stretching processes which cause appreciable molecular orientation. To separate these causes of crystallization as far as possible, Dr. E. L. Foster and H. Heap (Imperial Chemical Industries, Fibres Division) have constructed an apparatus with which a filament can be heated rapidly (in about 1 sec.) and its tension–extension characteristics measured. Data for amorphous polyethylene terephthalate ('Terylene') in the range 90°–120° C. showed that at low rates of strain the filament can be extended almost indefinitely with little increase in tension; at high rates of strain, however, the tension increases catastrophically with marked increase in crystallinity, as indicated by X-ray data.

Many measurements have been made of the relaxation of tension in a polymer strip which is rapidly extended and then maintained at constant extension. Prof. G. Gee, Dr. G. Allen and B. E. Read (University of Manchester) have constructed an apparatus in which the electronic recording of tension enables measurements to be made during the first ten seconds when most of the relaxation occurs, as well as at later times. Data were presented for natural rubber at moderate extensions (up to 50 per cent) and at temperatures in the range 45°–80° C., so that crystallization would be very limited. The data taken at the longer time intervals were used to calculate values for the activation energy and activation flow volume.

Elastic recovery in polythene rods has been investigated by J. J. Benbow (Imperial Chemical Industries, Akers Research Laboratory). A rod was held twisted for a given time, released, and the subsequent untwisting measured as a function of time. Only at very small strains (about 0·1 per cent) did the results agree with a theoretical relation obtained by combining Boltzmann's theory of the 'elastic after-effect' with the empirical result that internal friction in polythene subjected to oscillatory strains is independent of frequency. Polythene appeared less able to 'remember' the duration of the imposed twist as the magnitude of this twist was increased. The temperature was controlled at 30° C.; the maximum strain imposed was about 100 per cent.

Miscellaneous properties of polymeric materials. In the mechanical response of polymeric materials to oscillatory strains of very small amplitude, an increase of temperature can, in a sense, be compensated for by a decrease of frequency. Ferry has given a prescription for the appropriate changes of temperature and frequency scales whereby the data for dynamic modulus and dynamic viscosity for a given polymer can be superposed in master curves over a remarkably wide range. A. R. Payne (Research Association of British Rubber Manufacturers) gave a wealth of data showing the successful application of Ferry's method to various cross-linked and uncross-linked rubbers, for dielectrical as well as for mechanical measurements. In these correlations, there is only one disposable constant, a characteristic temperature the value of which is assigned empirically for each polymer. Mr. Payne also discussed data already published for a wide variety of polymers with particular reference to the temperature variation of the frequency at which the maximum value of tan δ occurs, where δ denotes the dielectric loss angle.

In order to obtain a rational measure of tear resistance of a cross-linked rubber, the growth of tears in rubber has been studied under controlled conditions. The concept and determination of a characteristic tearing energy was discussed by Dr. H. W. Greensmith (British Rubber Producers' Research Association). Measured values of this tearing energy showed much greater variation both with temperature and with rate of tearing for a synthetic rubber (*GR–S*) than for a natural rubber. The difference was attributed to the reinforcing effect of crystallization in the natural rubber. Addition of a filler to the synthetic rubber introduced a new maximum in the tearing energy when expressed as a function of temperature and tear rate.

Exposure of a polymer to radiation from an atomic pile or from a high-energy electron accelerator usually either creates cross-links (network junctions), or breaks chains, but rarely does both together. Mechanical properties of polymers are in the main the same, whether the cross-linking is effected by irradiation or by more conventional chemical means. Dr. A. Charlesby, Miss J. Burrows and T. Bain (Tube Investments Research Laboratories) have measured the modulus, stress–strain curve, elongation at break, and tensile strength for irradiated rubbers reinforced with carbon black, with sulphur, and with other additives. No significant difference was observed as between 'electron' radiation and pile radiation; the changes produced depended only on the total energy absorbed. There was some indication that chemical cross-linking gave a higher tensile strength than irradiative cross-linking. E. Fukada (Imperial College of Science and Technology, London) used γ-radiation to cross-link samples of a commercial polyester resin to which different amounts of styrene had been added. The dynamic modulus and mechanical damping at temperatures in the range 10°–160° C. at a single frequency of 0·22 cycle/sec. were obtained from observations of the horizontal and vertical deflexions of one end of a rod of the polymer which was rotated about its axis (held horizontally) by means of a rotating chuck at the other end.

The conference was attended by more than one hundred people, including visitors from Japan, Germany, France, and a substantial number from Holland. Discussions were always lively, and one was left with an impression of a flourishing field of investigation of considerable fundamental as well as technical interest. Publication of the papers and discussions is in the hands of Pergamon Press.

A. S. LODGE

TREE PHYSIOLOGY

THE physiology of forest trees has long been a neglected subject, partly due, no doubt, to the special difficulties of size and slow development which trees present to the experimenter. Nevertheless, there is evidence that interest in this field is rapidly gaining momentum. What is believed to have been the first major symposium on tree physiology was held at Harvard Forest, Petersham, Massachusetts, during April 8–12, under the sponsorship of the Maria Moors Cabot Foundation. The meeting was attended by physiologists and research workers from the United States, various Commonwealth countries and Europe.

Much of the classical work on tree physiology was concerned with water relations, and it is clear from a number of the papers at the meeting that this is still an active field of work. Prof. P. F. Scholander, of the University of Oslo, critically examined the cohesion theory of the ascent of sap. In the past, one of the major difficulties for this theory has been the fact that water uptake continues even when the water columns in the wood are broken by air 'embolism'. Evidence was presented showing that, in the grape-vine, air entering severed vessels apparently does not spread beyond these vessels, and in the region of the cut sap flow is maintained in the interstices between the vessels. The patterns and rates of moisture movement in trees of various species were dealt with by Dr. K. N. H. Greenidge. A detailed study of seasonal changes in the water-contents of the wood and bark of a large number of species by Prof. R. D. Gibbs (McGill University, Montreal) showed that several distinct seasonal patterns may be recognized in hardwoods, and in many cases similarities in these patterns followed the taxonomic relationships of the species. The mechanism of maple sap flow has long puzzled plant physiologists, and a detailed re-assessment of this problem was given by Prof. J. W. Marvin (University of Vermont). Using an automatic recording device, he found that variations in the rate of flow in the spring appear to be related to temperature conditions *preceding* the time of flow. Yet another aspect of the water relations of trees was dealt with by Dr. E. C. Stone (University of California), who reported work on dew-absorption by seedlings of various species of conifer. It was shown that certain species are capable of surviving for long periods after the soil moisture has been reduced to the ultimate wilting point by the absorption of artificial dew applied to the leaves, suggesting that natural dew may be an important source of moisture for these species under desert conditions.

Problems of photosynthesis in trees were dealt with by three speakers. Prof. P. J. Kramer discussed the photosynthesis of trees in relation to various environmental factors, and indicated how a consideration of this problem is of value in determining why forest trees react to environmental factors as they do. Prof. B. Huber (Forst botanisches Institut, Munich) described experiments to measure photosynthesis and respiration continuously in the field, using an infra-red recorder. In this way it was possible to study daily variations in the carbon dioxide content of air over a vegetation cover. Changes in photosynthetic efficiency of seedlings of *Pinus taeda* with increasing age were shown by Dr. F. H. Bormann (Dartmouth College, Hanover, N.H.) to be related to changes in the morphology of the primary and secondary leaves.

Several speakers dealt with the translocation of metabolites in trees, and a lively discussion on the possible validity of the 'mass-flow' hypothesis of Münch constituted an important part of the symposium. Prof. Hüber described observations on the daily variation in composition of phloem sap. These observations suggest that the entrance of food material into the sieve tubes is an active process, whereas its translocation appears to be essentially passive, since such different substances as fluorescein, sugars and radioactive isotopes move in the same direction and with similar velocities. Dr. M. H. Zimmermann (Harvard Forest) has examined the sieve-tube exudates of sixteen tree species. Observations on the diurnal and seasonal fluctuations in the gradient of sugars in the phloem are consistent with the 'mass-flow' theory. A novel way of obtaining samples of phloem sap, by cutting off the stylets of aphids, was described by Dr. T. E. Mittler (Unit of Insect Physiology, Cambridge). The method has also been used with isolated stem segments to investigate the possible mechanism of phloem transport.

The importance of the xylem sap in the transport of organic nitrogenous materials was dealt with by Dr. E. G. Bollard (Department of Scientific and Industrial Research, New Zealand). A survey of more than a hundred species showed that they can be divided into three groups, according to the type of organic nitrogenous compounds predominant in the xylem sap. In the majority glutamine or asparagine was the principal compound; in some species citrulline was predominant, while in a third group allantoin or allantoic acid was present in the greatest quantities. By injecting rubidium-86 and calcium-45 into the trunks of yellow birch and white pine, Dr. D. A. Fraser (Petawawa Forest Research Station, Chalk River, Ontario) was able to follow their upward movement in the xylem in the growing season, and the downward movement in the phloem in the autumn.

Two papers dealt with the distribution of chemical constituents in relation to taxonomic groups. The distribution of turpentines in a hundred species of the genus *Pinus* has been studied by Dr. N. T. Mirov (California Forest Experiment Station), who was able to relate similarities in the chemical constituents to taxonomic affinities. Prof. R. D. Gibbs described the results of the Mäule test (which indicates the presence of the syringyl group in the wood) with more than a thousand vascular plants. The taxonomic significance of the results was discussed.

The problem of frost-hardiness in *Robinia pseudoacacia* has been studied by Dr. D. Simonovitch (Science Service, Ottawa). He found that seasonal changes in the frost-resistance of the living bark are closely associated with changes in the protein constituents, using electrophoretic methods.

Dr. L. Leyton (Department of Forestry, Oxford) described observations on the relationship between tree growth and the mineral composition of the foliage of conifers, as a basis for the foliar diagnosis of mineral deficiencies. He gave examples in which this approach has been successfully employed in the diagnosis of deficiencies.

Several sessions were devoted to various aspects of growth physiology in trees. Four papers dealt with problems of root-growth. Dr. S. D. Richardson (University of Aberdeen) described experiments dealing with the interaction between shoot- and root-growth in sycamore (*Acer pseudoplatanus*), especially during the period of shoot dormancy. Disbudding experiments suggest that even in apparently dormant seedlings, root development is dependent upon physiological activity of the buds, and the possibility that auxin produced by the bud stimulates lateral-root initiation was suggested. The possible role of auxin secreted by the fungal symbiont in the formation of mycorrhizal roots of pine was discussed by Dr. V. Slankis (Laboratory of Forest Pathology, Maple, Ontario). It has proved possible to reproduce mycorrhiza-like root morphology by applying synthetic auxins in the absence of the fungus. Dr. S. Shapiro (Brookhaven National Laboratory) described the effect of light on the emergence of roots on stem cuttings of Lombardy poplar. A few minutes of exposure to low-intensity illumination is sufficient to inhibit the emergence of the roots. The most active region of the spectrum lies in the red (6800 A.), the effect of which is partially reversible by far-red radiation. Polarity phenomena in the regeneration of buds by Lombardy poplar were also described.

The effect of aeration in root growth of trees was dealt with by Dr. Leyton. In the absence of oxygen, root-growth ceased in jack pine (*Pinus banksiana*) and black spruce (*Picea mariana*), whereas willow (*Salix atrocinerea*) is able to continue root-growth without any apparent deleterious effect on the shoot.

Various other aspects of growth were covered by several speakers. The rate of cytoplasmic streaming in the cambial initials of *Pinus strobus* was studied by Prof. K. V. Thimann (Harvard University). The effect of indolyl acetic acid, enzyme inhibitors and oxygen tension was described. Cytoplasmic streaming shows marked seasonal variations. Dr. P. White (Jackson Memorial Laboratory, Bar Harbor) described tumours occurring on white spruce (*Picea glauca*), which arise as sectorial chimæras originating from single cells. In tissue culture, the tumour tissue shows characteristic metabolic differences from normal tissue. Variations in the amount of extractable auxin, in relation to developmental changes of longleaf pine (*Pinus palustris*), were described by Dr. C. L. Brown (Texas Forest Service), and seed dormancy in various species of pine was discussed by Prof. E. C. Stone.

A further session was devoted to photoperiodism in trees. Dr. R. T. Downes (U.S. Department of Agriculture, Beltsville) indicated the broad range of photoperiodic phenomena in tree seedlings. Dr. P. F. Wareing (University of Manchester) gave a comparative study of photoperiodism in seeds, buds and seedlings of a single species, *Betula pubescens*. The possible role of growth inhibitors in both seeds and buds was considered. Prof. S. S. Pauley (University of Minnesota) emphasized the importance of photoperiodism in forest tree breeding.

The importance of 'thermoperiodism' in loblolly pine (*P. taeda*) was demonstrated by Prof. Kramer. Best growth was made with the greatest difference in day and night temperatures. Species of oak show similar effects. It was suggested that 'thermoperiodism' may be important in limiting the range of some species.

The increasing importance of forest genetics has emphasized the need for a greater knowledge of the physiology of reproduction in trees, and there are signs that this subject is beginning to arouse widespread interest. Dr. K. Sax (Arnold Arboretum) described experiments designed to elucidate the physiological basis of several methods long used by horticulturalists to induce earlier flowering in trees, namely, the use of dwarfing rootstocks, bark inversion and knotting of the stem. A study of flower initiation in spruce in relation to various external conditions was described by Dr. D. A. Fraser.

Reproduction in pine was the subject of two papers. Dr. R. G. Stanley (California Forest Experiment Station) is carrying out a biochemical study of male, female and vegetative structures of pine, and attempting to identify differences in metabolites and enzyme patterns. Dr. Wareing outlined observations on the reproductive development of Scots pine and attempted to relate this development to the 'ageing' of the tree as a whole and of the individual branches.

There can be no doubt that the meeting was an outstanding success and will constitute a landmark in the development of this field of study. Tree physiologists are indebted to the Cabot Foundation, and especially to Prof. Thimann and Dr. Zimmerman as organizers of the meeting, for bringing them together to their mutual benefit. The proceedings of the symposium are to be published in full.

P. F. WAREING

NEW NATURE RESERVES IN BRITAIN

THE Nature Conservancy has announced the establishment of the following new nature reserves in England and Wales: Rodney Stoke Woods, Somersetshire; Coed Tremadoc, Caernarvonshire; Craig Cerrig Gleisiad, Breconshire; and the existing reserve at Coed Rheidol in Cardiganshire has been extended.

Rodney Stoke Woods—on the southern escarpment of the Mendip Hills—are the best example of a Mendip ash wood existing to-day. These Mendip woods are a scientifically interesting variant of the ash woods found throughout Britain on carboniferous limestone, which here underlies most of the reserve and in parts is exposed. The Reserve consists of an ash wood together with some rough grazing and covers an area of 65 acres: the highest part is 750 ft. above sea-level and the lowest about 200 ft. In these woods ash is the dominant tree and associated with it are the wych elm and field maple: the shrub and herb layers are very well developed. The whitebeam is common and the autumn crocus is locally abundant, while the blue gromwell is found in suitable habitats. Other characteristic plants of these woods are *Campanula trachelium*, *Daphne laureola* and the small-leaved lime. Rock rose is common in the old pasture and ferns such as hart's tongue, and *Asplenium trichomanes* occur in the rock crevices. The fauna is typical of the dryer Mendip woods, including badger, buzzard and many species of mollusc.

Access to this reserve, which will be used for research on ash wood and its ecology, will be by permit only. Applications for such permits and for authority to collect specimens of animals and plants should be sent to the Regional Officer for the South West, Nature Conservancy, Furzebrook Research Station, Wareham, Dorset.

The woods at Coed Tremadoc clothe precipitous cliff faces and the screes below them, and are a good example of survival of oak-woodland, which at one time was frequently found on cliff and rock faces in Wales up to quite high altitudes. Owing to extreme steepness, many of the ledges and gulleys of the cliffs have escaped the intensive sheep grazing and human interference which has had such a great effect on almost every kind of vegetation in Britain. The reserve lies 1¼ miles north-east of Portmadoc and covers 41 acres. It is the third reserve within the Snowdonia National Park, and has been established under a lease from Capt. S. T. A. Livingstone-Learmonth. The cliffs are composed of dolerite, which is a basic intrusive igneous rock, though basic ashes and shales also occur. The vegetation is very complex, due to the variability of the habitat and its instability. Sessile oak is characteristic with some admixture of pedunculate oak and ash. Sycamore has obtained a footing on the lower scree slopes. On the larger ledges and margins of scree such plants as marjoram and privet—both usually plants of chalk and limestone—are found; while on smaller ledges and rock faces ivy, bell heather, ling, honeysuckle, wood sage, sweet vernal grass, and composites, such as cat's ear, are prevalent, together with stunted, windswept oak. The shales have a flora which is more characteristic of acid soils and includes wavy hairgrass. Among the mosses, the rare *Hedwigia integrifolia* occurs. The crags are also the haunt of many small mammals and of birds, including the raven and peregrine falcon.

Craig Cerrig Gleisiad and Craig Cwm Du are two Old Red Sandstone crags about a mile apart and surrounded by moorland. They lie at the western end of the high glaciated ridge of the Brecon Beacons, within the Brecon Beacons National Park, between the 1,600 and 2,000 ft. contours, and about six miles south-west of Brecon. The part of the reserve now being declared is the western or Cwm Du portion, comprising 576 acres. It runs westward from the north end of Craig Cerrig Gleisiad and includes the whole of Craig Cwm Du cliffs (highest point about 1,750 ft.), the Nant Cwm Du valley and stream at their foot on the north side, and the moorland extending north and east up to and including the rock outcrops of Fan Frynych. The reserve has been established under a Nature Reserve agreement with the owner, Mr. S. E. Lewis. Negotiations are in progress to include the eastern cliffs of Craig Cerrig Gleisiad. The botanical interest is centred on rare arctic-alpine plants, notably purple saxifrage (*Saxifraga oppositifolia*), globe flower (*Trollius europaeus*), green spleenwort (*Asplenium viride*), and lesser meadow rue (*Thalictrum minus*). The two cliffs form the southernmost limit for this element in the British flora. The adjacent moorland is of a more general ecological interest, with varied upland vegetation types including much bilberry and matgrass.

In September 1956 the Nature Conservancy established the Coed Rheidol Nature Reserve covering an area of 18 acres. Two further small areas have now been added to this reserve; they lie on the western bank of the River Rheidol and link up with the small section of Dolgamfa Wood, which was included in the previous declaration, so that three-quarters of a mile of the western bank and half-a-mile of the eastern bank are now within the reserve, covering an area of 54 acres. The additional areas occupy steep rocky slopes ending in the vertical cliff of the river gorge. The rocks here consist largely of steeply inclined slabs of slate and shale, which are unstable and consequently the nature of the ground here is extremely hazardous. The woodlands have an interesting flora particularly rich in moisture-loving and shade-loving plants including many species of mosses.

Applications for permits, which will be necessary for those who wish to collect specimens of animals or plants in the Coed Tremadoc, Craig Cerrig Gleisiad or Coed Rheidol reserves, should be made to the Conservation Officer, Nature Conservancy, Y Fron, The Crescent, Upper Bangor, Bangor, Caernarvonshire.

CARNEGIE INSTITUTION OF WASHINGTON

REPORT FOR 1955–56

THE Year Book 1955–56 of the Carnegie Institution of Washington includes, besides the report of the President, reports of Departments and Special Studies and of the Executive Committee and Auditors. That of the Mount Wilson and Palomar Observatories refers to the completion during the year of the National Geographic Society–Palomar Observatory Sky Survey. A survey has been made of the present state of knowledge of the abundances of the elements in stellar atmospheres, and the programme of observations of stellar magnetic fields and on the internal motions in the Orion nebula continued, while the investigation of cepheid variables and other distance variables in the Andromeda galaxy was virtually completed. An outstanding event was the explanation of the light-emission in the Crab nebula as due to electrons circulating in a magnetic field, and a theoretical study has been made of the sources of radio emission in *N.G.C.* 5128 and *N.G.C.* 1316. An improved photoelectric guide has been developed for use at the coudé focus of the 200-in. telescope and two completely new photometers designed by Baum are being made for the 60-in. and 100-in. telescopes at Mount Wilson. The Joint Committee on Large Tubes for Telescopes is attempting to extend both the effective distance in space accessible to such instruments and spectrum measurements down to much fainter objects.

The Department of Terrestrial Magnetism found definite periodicities in the occurrence of radio-noise bursts from Jupiter, which were correlated with the rotational period of the non-equatorial regions of the planet. Exploration of the continental crust was extended into Alaska and the Yukon territory, and in rock-magnetism studies—in a co-operative project with the Bernard Price Institute for Geophysical Research at Johannesburg—progress was made in ascertaining the conditions under which a primary magnetization can survive under the influence of time and natural processes. A method has been developed for using the discordant ages calculated for uranium minerals to deduce the probable history of a group of such minerals subjected to the same sequence of events. In nuclear physics the study of low-lying nuclear energy-levels by the method of Coulomb excitation continued, and further evidence has accumulated in support of the Bohr–Mottelson unified model of the nucleus. In biophysics knowledge of the characteristics of the relatively loosely held 'pools' into which small molecules are concentrated before being linked into macromolecules has been greatly increased, some of the immediate precursors of nucleic acid have been determined, and an upper limit of three seconds established as the time required for protein synthesis, most of the work being carried out with *Escherichia coli* but some with *Torulopsis utilis*. Radioactive tracer studies were carried out with *Hydra littoralis* and carbon-14 glucose. Amino-acid tracers have been followed from a subcutaneous injection through the blood into cellular pools of free amino-acids and into the protein of new-born mice. During the year application of the membrane-filter technique to the problem of nucleic acid synthesis in *E. coli* demonstrated the formation and utilization of metabolic pools of precursors, and indicated the part played by phosphorylated intermediates. A comparatively full account of this work is given in the Departmental report, while that of the Geophysical Laboratory, which had a particularly stimulating and productive year, includes detailed accounts of the work on phase equilibria at high pressure, in which an apparatus has been constructed capable of achieving pressures of 60,000 atmospheres at about 700° C., with which studies have been made of minerals, such as might exist deep in the Earth, of the stability of hydrous iron silicates on primitive magmas, and of the age of rocks and minerals in a co-operative programme with the Department of Terrestrial Magnetism which has shown that concordant ages for potassium-40/argon-40 and rubidium-87/strontium-87 are obtained when measured on ancient minerals. Other work, which has shown that amino-acids such as glycine, sarcosine, alanine and β-alanine can be formed from a variety of primitive atmospheres, work on sulphide systems, which has shown that pyrite (FeS_2) is stable below 815° C. at 5,000 bars, and work on feldspars and feldspathoids, on statistical petrology, and on the routine absolute measurement of beta radioactivity at low level from thick samples, in which a general relation was discovered between the beta-absorption coefficient and the maximum energy of the radioactivity, is also described in detail.

The Department of Plant Biology has obtained evidence suggesting an active participation of carotene in the photochemical action of chloroplasts and, by a simple method developed for recording the absorption spectra of small amounts of pigments in living leaves, an unsuspected intermediate form of chlorophyll was discovered. Further progress was made in the work on the purification and characterization of the protochlorophyll–protein complex from leaves grown in the dark, and it has been found that the frozen and dried, partly purified, proteinaceous particles can transform the protochlorophyll to chlorophyll when illuminated in the dry state just as readily as when dissolved in water. The changes of absorption in *Chlorella* induced by light have been correlated with the ability of this alga to emit light, and three different types of active spectra have been found in studies of the effectiveness of light of different wavelengths in orientating the swimming of dinoflagellates. Data for a description of the behaviour of new types of hybrid grasses are expected to be complete in the next three years, and a comparative study of fifteen apomictic lines derived from a single first-generation hybrid between *Poa ampla* from Kahlotus, Washington, and *P. pratensis* from Athabasca, Canada, indicate that a very wide range of selection is possible among the progeny of a single new, sexually reproducing hybrid. Stable apomictic derivatives from the combination *P. ampla* from the Palouse Prairie region and *P. arida* from Nebraska have been produced for the first time.

In the Department of Genetics new experimental evidence was obtained that large, functionally intact pieces of viral nucleic acid may pass from parent to offspring phage, while genetic analyses, by the transduction method, of short regions of the chromosome complex of the bacterium *Salmonella typhimurium* have shown that mutations occurring at different sites of a single locus, although they affect one function primarily, may produce mutants differing considerably from one another in various properties. Several different controlling elements in the maize chromosome complement have been identified, and electron micrographs of salivary glands of *Drosophila* and of dividing cells of *Tradescantia* have been interpreted as indicating that the patterns of organization of their chromosomes represent a hierarchy of pairs of helically disposed chromonemata. Studies of the effect of ribonuclease, ethylenediaminetetraacetate and calcium chloride on *Drosophila* and onion roots indicate that any agent which disrupts the normal metabolism of the cell can lead to instability reflected in modification of chromosome form and behaviour. The stage of development of the salivary-gland cell in *Drosophila* at which 'blebbing' of the nuclear membrane into the cytoplasm occurs has been correlated with the assumption of a new function by the cell. A mathematical analysis of the dynamics of bacterial populations was completed.

In the Department of Embryology exploration of the chemodifferentiation of the heart-forming areas of the early chick embryo demonstrated that antimycin *A* acts as a specific inhibitor of heart formation, while studies on the mechanism of the spacing of blastocysts along the rabbit uterus showed that the spacing was due to the delicate interaction of two mechanisms dependent on progesterone. Studies of the nature of the fluid of the rabbit oviduct were concluded, progress is reported in the analysis of the vascular changes in the menstrual cycle in the rhesus monkey, and further investigations of the vascular patterns of the placenta indicate that maternal blood enters the intervillous space from small blood vessels, the spiral arterioles, under a head of maternal pressure. The first phase of a study of the effects of reserpine on the reproductive cycle of the rhesus monkey was completed.

CHEMICAL RESEARCH LABORATORY

REPORT FOR 1956

THE wide variety of research now in hand at the Chemical Research Laboratory is described in a report* entitled "Chemistry Research 1956", published by H.M. Stationery Office for the Department of Scientific and Industrial Research. The investigation of corrosion problems has been continued. It includes research into the possibility of improving the efficiency of corrosion inhibitors for use in anti-freeze mixtures for engine-cooling systems, the study of the rapid pitting of boiler tubes in marine boilers, which it was found could be prevented by the addition of small amounts of copper to the steel used in the manufacture of the tubes, the discovery that the corrosion of buried pipes and underground fittings was due to the bacterial reduction to sulphide of large amounts of sulphates in the soil, and the corrosion of fuel pumps in aircraft by sulphur compounds, produced by bacterial reduction of sulphates in water, finding their way into petroleum above the water storage tanks. There were also purely scientific investigations of corrosion.

* Chemistry Research 1956: The Report of the Chemistry Research Board with the Report of the Director of the Chemical Research Laboratory. Pp. vi+86. (London: H.M. Stationery Office, 1957.) 4s. net.

Work on the separation of a number of rare earth metals by the use of columns of ion-exchange resins yielded important results improving the understanding of the process and in particular the control of the various factors involved in a separation. Improved techniques have made possible better separations of light-earth fractions than have previously been achieved. A large-scale apparatus capable of handling kilogram quantities of rare earths is now being used for this work. A simple but very effective method for the purification of mercury is described; investigations of the purification of elements of interest as semiconductors are in progress, and reliable methods of measuring very small amounts of impurities in such materials are under investigation.

Work on the extraction of uranium and thorium from minerals and ores is being done on behalf of the United Kingdom Atomic Energy Authority, and new recovery methods are being studied. A great increase in the use of radioactive tracer techniques has taken place during the year.

Much valuable work has been done on the properties of pure organic compounds and the mechanism of organic reactions. Determinations of heats of combustion are being carried out in collaboration with the National Physical Laboratory. Two principal lines of investigation into high polymers are the study of the structure and permeability of polymer films, and work on the fractionation of polymers and the determination of their molecular weights. Basic research into the ion-exchange and allied properties of cross-linked polymers is being continued. The preparation of ion-selective polymer films is of particular industrial importance in the treatment of brackish water and also of effluents.

It will be seen that the Chemical Laboratory is actively engaged on a large number of researches of both purely scientific and industrial interest. The report is by no means a bare summary of this work but is an interesting and useful source of much information which research workers will be pleased to have in such a compact form. The cover of the book shows a portion of the periodic table, and, of the atomic weights in it, fifteen differ from the values in the 1955 international table.

AUTONOMOUS ACTION OF LETHAL MUTATIONS INDUCED IN THE GERM CELLS OF *DROSOPHILA MELANOGASTER* BY 2-CHLOROETHYL METHANESULPHONATE

By C. E. PURDOM*

Chester Beatty Research Institute, Institute of Cancer Research, Royal Cancer Hospital, Fulham Road, London, S.W.3

IN young *Drosophila* males the sperm to be utilized for successive broods of offspring comes from successively earlier stages of spermatogenesis in the testis, from mature sperm to early spermatogonia. Following treatment with a mutagen, the pattern of effect measured in successive broods will be a reflexion of the sensitivity of the various germ cell stages to the action of the mutagen.

The mutagenic properties of 2-chloroethyl methanesulphonate (*C.B.* 1506) have been studied by Fahmy and Fahmy[1], who found that the ratio of sex-linked recessive visibles to lethals rises in the later broods, from 0·35 in broods utilizing sperm from post-meiotic cells to 0·6–1·0 in broods utilizing sperm from pre-meiotic cells at the time of treatment. Three possible explanations of the phenomenon may be listed.

(1) The mutagen may have some specific action on the visible loci concerned. This presupposes some common chemical properties of the visible loci as a whole as compared to the lethals as a whole and also leaves unexplained the difference between pre- and post-meiotic cells.

(2) The mutagen may induce more 'point mutations' in the pre-meiotic cells. This would produce an increase in the visible to lethal ratio, since in larger areas of chromosomal damage, the locus with the earliest action[2] would be the definitive one, masking the presence of others, in this case, visibles.

(3) Essentially the same proportions of the different mutations may be produced in all cells; but some of the lethals induced in the pre-meiotic cells may act autonomously, killing the cell before it produces sperm, thereby increasing the observed proportion of visibles.

This present investigation was undertaken to examine the last possibility, that the increase in the ratio of visibles to lethals was produced by adverse selection in the germ line against lethals functioning autonomously.

Approximately 0·2 µl. of a 0·2 per cent solution of *C.B.* 1506 in 0·4 per cent saline was injected into the abdomens of *Drosophila* males (Oregon-*K* stock), 48 ± 4 hr. after emergence. The treated males were tested by the *Cy*/*L* technique[3] for the detection of autosomal (2nd chromosome) and sex-linked mutations. Lethals were scored as cultures containing no non-Muller-5 males at all in the F_2 and confirmatory F_3 for the sex-linked data, and no Cy^+/L^+ flies in the F_3 and F_4 for the 2nd chromosome data. Visible

	Weighted mean	$M_1 = 6·7$; $\sigma_1 = 0·76$					50·6			
	Ratio II/*X*	2·2	7·0	1·8	2·6	2·6	3·8	—	14·9	10·7
		1·9 *s*† = 0·11					5·3			

* One group of 31 F_1 cultures (*A*) and 25 F_1 cultures (*B*) from a single male which was infertile in all other broods has been eliminated.

† $x = \frac{X_1}{X_2}$; $s^2 = \frac{M_1^2}{M_2^2}(v_1^2 - 2 r v_1 v_2 + v_2^2)$; $v_1 = \frac{\sigma_1}{M_1}$; $r = 0·87$.

mutations were scored in the sex-linked experiment only, and scored as mutations producing any non-Muller-5 males which showed any deviation from the Oregon-*K* phenotype. 'Semi-lethals' which produced a marked reduction in the numbers of wild-type males in the F_2, but with no phenotypic deviation, were not classed as visibles nor included in the lethal data.

The results are shown in Table 1 and represented graphically in Fig. 1. Broods I–IV and VI–IX are taken together, since the comparisons to be made are between post-meiotic mutations I–IV, and pre-meiotic mutations VI–IX. Brood V is not included in either since overlapping may occur here. The yield of 2nd chromosome lethals is approximately double that of sex-linked lethals for the first four broods. A two by four contingency table of the sex-linked and 2nd chromosome lethals in the first four broods gives a value of $\chi^2 = 2·9$; $\nu = 3$; $P = 0·25$; thus there is no indication of heterogeneity throughout these broods. For broods I–IX (except VII) $\chi^2 = 16·5$; $\nu = 6$; $P = 0·01$. This indicates a considerable amount of heterogeneity in the results which must be due to the increase in the ratio of autosomal to sex-linked lethals in the later broods, the value 5·3 for broods VI, VIII and IX being well outside 3*s* for broods I–IV, the ratio being 1·9 ± 0·33 (Table 1).

The data on visible mutations are not sufficiently large for statistical analysis, but agree in general with the data from the larger experiments by Fahmy and Fahmy[1], in showing a disproportionate rise in frequency as compared to lethals in the later broods. The exceptionally low incidence of visibles in brood I in the present experiment is probably not significant.

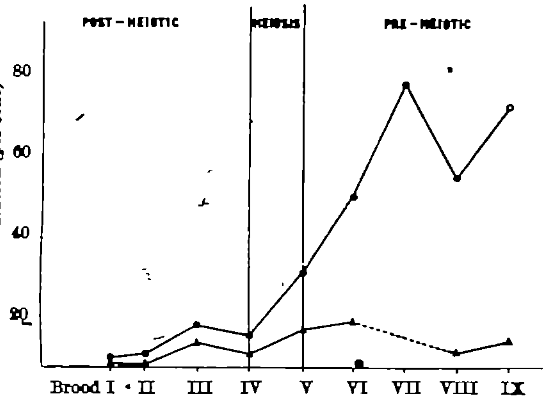

Fig. 1. The brood pattern of *X*-chromosome lethals (△), and second chromosome lethals (○), induced by 2-chloroethyl methane-sulphonate

The autonomous nature of many lethal mutations in somatic tissue of *Drosophila* has been demonstrated by Ephrussi[4], Demerec[5] and Stern[6], who studied the fate of cells homozygous or hemizygous for a lethal mutation, arising by somatic crossing-over or non-disjunction in viable heterozygotes, and found that even single cells surrounded by normal tissue die. Similarly, Gloor[7] demonstrated that some lethal factors function autonomously in male germ cells transplanted into genetically normal hosts, the germ cells not developing beyond the stage they normally reach in the donor. Thus an *a priori* consideration may be given to the interpretation of the results of Fahmy and Fahmy[1] and of the present investigation in terms of germinal selection by autonomous action.

Of the three explanations given in the introduction, the first clearly lacks experimental or theoretical support. The second is also untenable, since if more 'point mutations' were produced in the later broods, the same proportion of autosomal and sex-linked lethals should be produced throughout, and this is clearly not so. The third explanation fits the observations. Developing spermatids and spermatozoa seem to be protected against the harmful effects of quite drastic genetical damage, since extensive chromosomal aberrations which later produce dominant lethality persist in sperm which is still capable of fertilization. Therefore, the proportions of these lethal mutations and sex-linked visibles detected in the late germ cells are a good estimate of the actual proportion produced in the cells themselves. The results show a striking increase in the yield of autosomal recessive-lethals and sex-linked recessive visibles against sex-linked recessive lethals in late broods. The former mutations are both ineffectual when induced in pre-meiotic cells; the autosomal lethals exist in the form of viable heterozygotes, the visibles are by definition non-lethal; whereas sex-linked lethals in the hemizygous state may be eliminated by autonomous action. Since there is no evidence that the above classes of mutations are produced in different proportions in different chromosomes, throughout the stages of the germ line, it must be concluded that the divergence in the relative yields of autosomal lethals and sex-linked visibles from sex-linked lethals is most probably due to adverse selection against the latter by autonomy.

I wish to thank Dr. O. G. Fahmy for his interest in this work. This investigation has been supported by grants to the Chester Beatty Institute (Institute of Cancer Research, Royal Marsden Hospital) from the British Empire Cancer Campaign, the Jane Coffin Childs Memorial Fund for Medical Research, the Anna Fuller Fund, and the National Cancer Institute of the National Institutes of Health, United States Public Health Service.

ROLE OF CATIONS IN PHAGE ADSORPTION TO SENSITIVE BACTERIA

By J. BEUMER, J. DIRKX and M. P. BEUMER-JOCHMANS

Institut Pasteur de Bruxelles, Belgium

IT has been shown previously[1] that the adsorption of phage *H-SHPB*(Ca), which is a temperate phage isolated from the lysogenic coliform strain 'Lisbonne', on the *Shigella dysenteriae* strain *SHPB* in broth requires calcium ions, whereas the adsorption of the same phage on another *Sh. dysenteriae* strain (Flexner 6 *S*) does not.

This led us to investigate further the role of cations in adsorption of phage *H-SHPB*(Ca) on sensitive bacteria. The experimental procedure was as follows. To living bacteria from 5-hr. old cultures, suspended in maleate–buffer solutions of various mono- and divalent cations at *p*H 7·3, phage was added at a concentration of about 1 phage to 100 bacteria. After 5 min. in the water-bath at 37° C., 1 ml. of the bacteria + phage mixture was cooled in ice and then centrifugated at 3,000 rev./min. for 5 min.; the bacterial sediment was resuspended in 1 ml. broth and the adsorbed phage was titrated by plating the resuspended bacterial sediment on a sensitive strain (*SHPB*). The percentage of adsorbed phage is calculated directly by comparing the titre of the phage in the bacterial sediment to that initially introduced in the bacterial suspension.

The experimental results (to be published in detail elsewhere[2]) show that in very dilute maleate–buffer solutions no adsorption of the phage takes place and that very precise cationic conditions must obtain for this adsorption to occur. As can be seen from Table 1, in sodium maleate adsorption of the phage on the *R* forms of sensitive bacterial strains (*SHPB*, *Y6R* and *F6R*) only takes place at concentrations between 0·01 and 0·04 or 0·06 *M* sodium ions, adsorption being inhibited at higher concentrations. The adsorption of phage on the *S* form (*F6 S*), however, does not occur below 0·03 *M* sodium and is not inhibited by sodium ion concentrations as high as 4 *M*. Other monovalent cations, such as potassium, ammonium or $(CH_3)_3NH_3^+$, are effective at concentrations similar to those of sodium. Divalent cations (calcium, strontium, barium and magnesium) promote adsorption at a concentration of 0·001 *M* or higher; that is, they are ten times more efficient than monovalent cations. Except for magnesium ions, which inhibit adsorption at concentrations higher than 0·04 *M*, no inhibition by divalent cations could be demonstrated at concentrations up to 0·09 *M*, and higher concentrations were found to be toxic for the phage.

Table 1. MOLECULAR CONCENTRATIONS ALLOWING ADSORPTION OF PHAGE *H-SHPB*(CA) ON:

	SHPB	*Y6 R*	*F6 R*	*F6 S*
Sodium maleate	0·014–0·04	0·016–0·06	0·01–0·06	$\geq$0·03
Calcium maleate	$\geq$0·001	$\geq$0·001	$\geq$0·001	$\geq$0·004

Thus the necessity of calcium for the adsorption of phage *H-SHPB*(Ca) on some strains in broth is not a specific requirement for that ion, but the expression of a more general need, that of cations in adequate concentrations, as Puck and his co-workers[3] have shown for the *T*-system of phages. The cationic environment required for phage adsorption varies, not only with the phage as Puck has shown, but also for the same phage with the sensitive strain under test. The *S* strain (*F6 S*) exhibits a behaviour different from that of *R* strains, in being far less sensitive to the inhibition by high concentrations of sodium ions. It has been shown elsewhere[4] that the *R* strains, while not adsorbing the phage in broth (containing 0·2 *M* monovalent cations), are able to adsorb it in broth diluted 1 : 5 with distilled water, because the dilution lowers the concentration of monovalent cations to a level (0·04 *M*) compatible with phage adsorption on the *R* strains. The *S* strain, in contrast, adsorbs the phage in undiluted broth.

Following Puck and Sagik[5], cations are required for phage adsorption, to reduce the negative charge of the phage, so lessening the repulsion energy prevailing between phage and bacteria, which are both negatively charged. Cations seem thus to act only by their electric charge. As we have observed, the adsorption of the same phage on different bacterial strains may require different cationic conditions. In order to find a tentative explanation of the role of cations in phage adsorption, we have investigated the electrophoretic mobilities of both phage and bacteria, with the view of determining their electrical potential.

We find, for bacteria, the classical electrophoretic properties, that is, each ion exerts a weak but specific effect on the mobilities, divalent cations reduce the mobilities by a factor of about 2 and the *R* and *S* strains showed a marked difference in mobilities[6].

From the mobility values, the ζ-potentials were calculated and their values are summarized in Table 2.

The mobilities of the phage at various ionic conditions were determined by the Hittorf method; but, for the subsequent calculations to be performed, hypotheses must be introduced concerning the form of the particle. As shown by electron microscopy, the phage possesses a classical structure with a head

Table 2. Various Electrochemical Characteristics of Phage and Bacteria

Ion	Conc.	ζ-Potential					Charge density of phage (10^{-3})	Ionic density in the ζ-plane of bacteria (10^{-3})			
		SHPB	*F6 R*	*Y6 R*	*F6 S*	*H*—		*SHP B*	*F6 R*	*Y6 R*	*F6 S*
Sodium	8×10^{-4} 2×10^{-3} 8×10^{-3}	85·6 101·2 114·3	86·6 96·8 109·2	89·5 103·0 111·3	56·3 47·7 54·8	19·6 24·2 18·2	1·08 0·667 0·336	5·02 3·42 2·58	5·17 3·14 2·50	5·84 3·53 2·64	2·89 1·16 0·765
Calcium	4×10^{-5} 2×10^{-4} 4×10^{-4}	41·2 49·0 44·6	38·5 48·0 46·3	37·7 63·0 61·8	20·9 27·4 25·5	1·86 18·0 14·2	0·12 0·282 0·108	3·36 1·02 0·385	3·02 0·978 0·409	2·94 1·78 0·740	1·42 0·431 0·176

All potential values are expressed in millivolts. The charge densities are expressed in number of elementary electronic charges per square micron. Concentrations are in molarities

about 75 mμ in diameter, surmounting a tail 240 mμ in length and 25 mμ in diameter. The lack of knowledge about the frictional coefficient of such a form making the calculation practically impossible, we thus assumed that the phage acts as an 'equivalent cylinder', the length of which is that of the phage and with an 'equivalent radius' of 16·8 mμ. Moreover, we suppose that this particle possesses a permanent dipole which causes the phage to be orientated parallel to the electric field.

On these assumptions we were able to calculate the ζ-potential of the phage and to determine also its charge by using the Gorin equation:

$$Q = \frac{\zeta(L + 2r)\, K_1(\varkappa.r)\, \varkappa.r}{2\, K_2(\varkappa.r)}$$

in which Q is the charge, ζ the ζ-potential, L the length of the equivalent cylinder, r its radius, $\varkappa$ the Debye–Hückel parameter and K_1 and K_2 Bessel functions varying with the product $\varkappa.r$.

We have also calculated the electro-ionic densities of the bacteria in their ζ-plane. All calculated values are listed in Table 2.

If, according to Puck and Sagik[6], the fixation of a phage on a sensitive bacterium results from the neutralization of the negative charges carried by the phage by the positive cations surrounding the bacterium, it may be concluded, from the values in Table 2, that fixation will occur at all concentrations listed here, owing to the fact that the positive charge densities around the bacteria are, in all cases, greater than the negative charge of the phage.

In fact, our experiments have demonstrated that the adsorption of the phage particle on the sensitive strains occurs only in a much more limited range of concentrations. We propose to explain this phenomenon in terms of the stability of colloids, considering the phage–bacteria suspension as a colloidal pool for which the fixation of the phage on the bacteria can occur only for 'flocculating' values of the ionic strength.

For this purpose, we use the stability theory of Verwey and Overbeek[7] with some modifications to take into account the differences in shape and charge between phage and bacteria. Finally, we arrive at the following expressions.

For the repulsive energy, V_r:

$$V_r = \varepsilon.a.\zeta_1.\zeta_2 \ln \{1 + \exp(-\varkappa.H_0)\}$$

in which ε is the dielectric constant of the medium, a is the equivalent radius of the phage, ζ_1 and ζ_2 the ζ-potentials of the phage and the bacteria respectively and H_0 is the shortest distance between the particles; and for the attractive energy, V_a:

$$V_a = \frac{-A.a}{6} \cdot \frac{1}{H_0}$$

in which A is the London–Van der Waals attraction constant. The reasons for adopting these formulæ have been described in detail elsewhere[8].

From these formulæ, we can obtain the total energy of interaction curves between phage and bacteria versus the distance H_0 between them. If, on the other hand, ionic conditions are allowed to change, a family of curves is then obtained. Fig. 1 shows such a family for the monovalent cations, and Fig. 2 that for the divalent ones. It is clear from these curves that, as soon as an energy barrier sufficiently high (greater than 10 kT as stated by Verwey and Overbeek) or sufficiently long (greater than 100 A.) exists, phage adsorption becomes impossible. This is fully confirmed by our experiments for all *R*-type bacteria, but not for the *F6 S* strain. The energy barrier vanishes progressively with increasing ionic

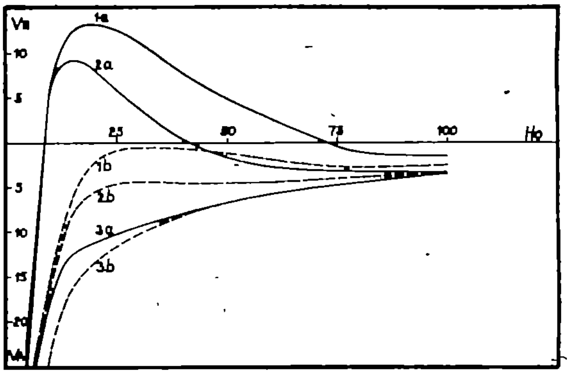

Fig. 1. Energy of interaction between phage and bacteria for various concentrations of monovalent ions. Abscissa: distance between phage and bacteria in angström units. Ordinate: energy of interaction expressed in multiples of kT. The repulsion energy is taken positively, the attractive one negatively. The full lines are for the *R* strains, the broken ones for the *F6 S*.
Curves 1*a* and 1*b* correspond to $[\text{Na}^+] = 8 \times 10^{-4}$; curves 2*a* and 2*b* to $[\text{Na}^+] = 2 \times 10^{-3}$ and curves 3*a* and 3*b* to $[\text{Na}^+] = 8 \times 10^{-3}$

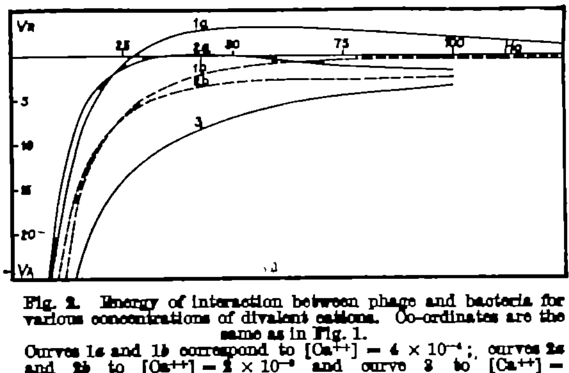

Fig. 2. Energy of interaction between phage and bacteria for various concentrations of divalent cations. Co-ordinates are the same as in Fig. 1.
Curves 1*a* and 1*b* correspond to $[\text{Ca}^{++}] = 4 \times 10^{-5}$; curves 2*a* and 2*b* to $[\text{Ca}^{++}] = 2 \times 10^{-4}$ and curve 3 to $[\text{Ca}^{++}] = 4 \times 10^{-4}$. In this last case, the curves for the *S* and *R* strains are so close together that they cannot be drawn separately

strength and phage adsorption becomes possible, which is in full agreement with experimental results for the *R* strains.

Two special cases, however, seem not to obey Verwey and Overbeek's theory.

The first one is concerned with the *F*6 *S* strain, for which fixation takes place only at high ionic concentrations despite the fact that no energy barrier exists at any of the ionic strengths tested. In other words, we can say that fixation of the phage on the *F*6 *S* strain occurs only when attraction predominates, as can be seen on the curves of Figs. 1 and 2. This suggests that another type of barrier must be present around these bacteria; for example, a mechanical one. We believe this mechanical barrier is formed by the superficial *S* antigen, this view being consistent with the fact that phage fixation on the *F*6 *S* strain requires an attractive energy of the same order of magnitude as that necessary for protein denaturation. The *S* strains seem, in a general manner, to show very anomalous electrochemical behaviour (unpublished work) and probably require a complete re-investigation according to their particular properties.

A second point that cannot be explained by the theory presented here is the inhibitory effect of cations at high concentration. Nevertheless, a relation seems to exist between the inhibitory effect of highly concentrated cations and the fraction of the bacterial surface occupied by them. As soon as this surface fraction becomes higher than 10–12 per cent of the total bacterial surface, no subsequent fixation occurs on the *R* strains. It may be suggested that, to explain the inhibition, the surface fraction occupied by the ions is not the sole determining factor but that the energy of binding of these ions to the bacterial surface, depending on the bacterial potential, must also be taken into consideration. If this is correct, it may be inferred that, on the *S* strain, a higher surface occupation will be tolerated before the inhibition takes place, because of the much smaller potential of these strains.

On this basis it was calculated that inhibition should begin for the *S* strain at a concentration as high as 4 *M* for the monovalent cations. This point seems to be experimentally confirmed.

For the divalent cations, inhibition would begin at 1 *M*, but this last point was impossible to investigate, the phage being destroyed too rapidly in these media.

The treatment of the inhibition with the aid of the statistical theory of the condensed state will give, perhaps, a better explanation of the experiments.

LOCALIZATION OF RADIOACTIVE AND STABLE HEAVY NUCLIDES IN OCEAN SEDIMENTS

By G. ARRHENIUS and M. N. BRAMLETTE

Scripps Institution of Oceanography, La Jolla, California

AND

E. PICCIOTTO

Laboratoire de Physique Nucléaire, Université Libre de Bruxelles

A VARYING fraction of the sediment accumulating on the ocean floor consists of solids formed by precipitation from solution in the sea water, at the sediment surface, and in the sediment. Among these marine hydrogenous minerals are zeolites, manganite, goethite, barite and possibly some clay minerals, rutile and anatase. Also, a number of ionic species are transferred to the sediment by sorption in the molecular pores of the zeolites[1] and in the central layers of the manganites[2–4]. ('Manganite' is in this communication used as a chemical term, in accordance with Buser and co-workers[2]. The proper mineral name will be discussed elsewhere.) An extensive review of the distribution of rare metals in sedimentary rocks and an evaluation of the possible processes leading to this distribution have been published by Krauskopf[5]. There are few cases where the localization of trace elements in specific mineral constituents of fine-grained sedimentary rocks has been demonstrated directly.

The localization of trace metals in the minerals of ocean sediments is of special interest in the case of the naturally radioactive elements. The use of these elements for geochronological purposes depends largely on understanding the mechanism of transfer from the ocean to the sediment, and of redistribution following radioactive decay.

It is known that ionium (thorium-230) is at least partly separated from its predecessors in the ocean and carried to the ocean floor, where it generally gives rise to a high radium content. Several hypotheses have been advanced as to the mechanism of transfer of thorium from the ocean water to the sediment. Verification of any hypothesis by determining the localization of the thorium in particular constituents of the sediments has, however, been lacking, although Goldberg and Picciotto's finding[4] of a high thorium content in manganese nodules as well as Goldberg's theoretical considerations[6] point to the manganite as an important host mineral for this element.

Attempts to determine the ionium- and thorium-carrying minerals were started at Scripps Institution of Oceanography by E. D. Goldberg and us in 1954. Nuclear-emulsion techniques and β-counting demonstrated that most of the α- and β-activity from visible sources in the South Pacific sediments investigated was concentrated in authigenic crystals of phillipsite[2]. Further investigations were carried out in the Institute of Nuclear Physics of the University of Brussels, using sediments from the North Equatorial Pacific with a low content of phillipsite. The distribution of α-activity was studied by autoradiographs of sections of sediment cores, and by suspension of sediment in liquid nuclear emulsion. The results of the suspension studies can be summarized as follows:

(1) The biogenous opal (mainly in the form of diatom frustules and radiolarian skeletons) is entirely inactive.

(2) 10 per cent of the α-tracks originate from small crystals (of the order 1μ) with a high refractive index. The specific activity of this mineral, which is possibly barite, is very high.

(3) 15 per cent of the activity occurs in aggregates with an average size of 3–10μ, frequently with a barium content exceeding 10 per cent and with densities ranging from 2·1 to 2·3. These aggregates may be fecal pellets of benthonic animals.

(4) 25 per cent of the activity is associated with amber-coloured, fibrous fragments of widely varying size, mostly 20–100μ. The specific activity is of the order of 10^{-7} curie per gm. These fragments were afterwards demonstrated to consist of fibrous apatite and organic matter, and to be skeletal debris of fish.

(5) The remaining 50 per cent of the α-tracks do not originate from any visible solid sources, and are supposed to indicate radioactive matter in true or colloidal solution in the pore water of the sediment, or displaced from the solids of the sediment upon suspension in the photographic emulsion.

Subsequent analysis of skeletal fish debris from pelagic sediments of late Pleistocene to Recent age revealed that this material has a remarkable composition. In addition to the very high content of radioactive elements, there were found several per cent of the rare-earth elements, 0·6–1·5 per cent zinc, 0·1–0·5 per cent copper, 0·05–0·15 per cent tin and 0·03–0·10 per cent lead.

By separation of the organic phase of the fish debris from the apatite phase, it was demonstrated that the rare-earth elements and most of the strontium and barium occur in the apatite structure, whereas the organic phase contains the zinc, tin, lead, titanium, copper and silver, and much of the magnesium, aluminium, chromium and nickel.

Some of the bone and scale debris could be identified as derived from various genera of bathypelagic fish (Hubbs, Dr. Carl L., personal communication). One fragment appeared to be a part of a squid beak.

Analysis of the ashed residue of macerated bathypelagic fish caught by tow-net did not reveal any high concentrations of heavy metals, except for copper (0·03–0·04 per cent), zinc (0·01 per cent) and lead (0·005–0·01 per cent). These amounts, however, are considerably smaller than those found in the fossil debris. The concentration of heavy metals in the fish debris, therefore, appears to have taken place after the death of the organism. Fish debris from the top stratum of the sediment, corresponding to a time period of about the past ten thousand years, had already reached the same high concentration of heavy metals which is found in debris from Tertiary strata. It is thus evident that the concentration takes place in an early phase of the accumulation of the sediment. The measurements of the uranium, ionium, radium and thorium content of the fish debris have not yet been completed. Several facts suggest, however, that the high radioactivity of the Recent and Pleistocene fish debris is mainly due to thorium isotopes and their daughter products. The limitation of the highly alpha-active spots to the upper strata in the cores excludes the possibility of dominant uranium support; but, on the other hand, the active spots extend too far down to consist dominantly of unsupported radium. The high concentration of the rare-earth elements makes it highly probable that thorium, which has a geochemical behaviour similar to that of the rare-earth elements, is present in considerable amounts.

In a recent paper, Bowie and Atkin[6] have described skeletal material of Devonian fish with large amounts of associated uranium and especially thorium. In the case described, the uranium is mainly localized in the apatite structure, whereas the thorium is concentrated in the hydrocarbons which occur in the cavities of the bone structure. It is difficult at the present time to evaluate this finding in relation to the present observations on Cenozoic fish debris.

With long exposure on surfaces of especially low rate of accumulation, the biogenous apatite appears to dissolve at great ocean depth. The heavy-metal ions thus released seem to be resorbed in the secondary layer of the manganites, which are stable and offer a large active surface area. As a result, large amounts of thorium and rare-earth elements may be added to any already taken up in manganese nodules. In pelagic clays and oozes, where other components in addition to manganese micronodules contribute to a higher rate of accumulation, the fish debris is largely preserved, and the micronodules are lower in rare-earth elements.

Measurements of the crystallite size of marine apatites show a relation (that may be direct or indirect) of this parameter to the rare-earth content. The bathypelagic fish debris has a crystallite size of 300–400 A. along the Z-axis and has a rare-earth content as high as a few per cent. Whale bone fragments, exposed under similar conditions on the deep ocean bottom, but with a crystallite size of 600–1200 A., have a rare-earth content of the order of 0·1 per cent. Marine inorganic apatites, with crystallite sizes greater than 20,000 A., contain a total of rare earths of only 0·05 per cent or less.

It thus seems that ionium, produced from uranium-234 in solution in sea water, together with other thorium isotopes, the rare-earth elements and a number of other heavy metals, is carried to the sediment and sorbed to the surface of the microcrystalline apatite of skeletal debris. If a solid carrier is involved, this may not necessarily be the apatite itself but some other unidentified solid, such as organic matter, which is later dissolved. The details of these processes, as well as the redistribution of radium formed by the decay of ionium, are being further investigated, and a more extensive account of the results will be given on completion of the first phase of the work.

Support for this investigation was received from the Geological Society of America and the Office of Naval Research.

Electron Micrographs of Cross-Sections of Protein Monolayers

ELECTRON micrographs of cross-sections of protein monolayers have been obtained in the following way. A monolayer of protein, a commercial sample of egg albumen, was spread at the surface of water contained in a small Langmuir type trough. This layer was then compressed and crumpled by advancing a barrier coated with paraffin wax towards a second retaining barrier. When the two barriers were about a centimetre apart, the crumpled film became visible at the interface and was lifted from the water as a frail thread by means of a wire yoke. Portions of this thread were prepared for cross-sectioning by dehydrating in an alcohol series and embedding in an epoxide resin[1]. It was found advantageous to 'stain' the specimen first by treating it for a short time in a buffered osmium tetroxide solution. The thread, darkened and hardened by this treatment, was easier to handle and to see by eye in the block and also in the electron microscope. Very thin sections were cut from the block at right angles to the length of the thread by the standard procedure for electron microscopy[2] and examined in a Siemens 'Elmiskop I' microscope.

The cross-section of the crumpled sheet of protein appeared as a thin, dense, highly convoluted line (Fig. 1). Since the thickness of the best sections (about 200 A.) was still some ten times that of the monolayers (10–20 A.), it was not expected that the films viewed end on would everywhere reveal their true thickness. The thinnest portions observed in osmium-fixed material were in fact about 50 A. thick, and some of these appeared double, suggesting either that the osmium was deposited on each side of the protein film or that more than a simple monolayer was present. Occasionally a contaminating layer was seen adsorbed on one side of the film and pinched-off tubules usually enclosed amorphous material which may have been excess protein.

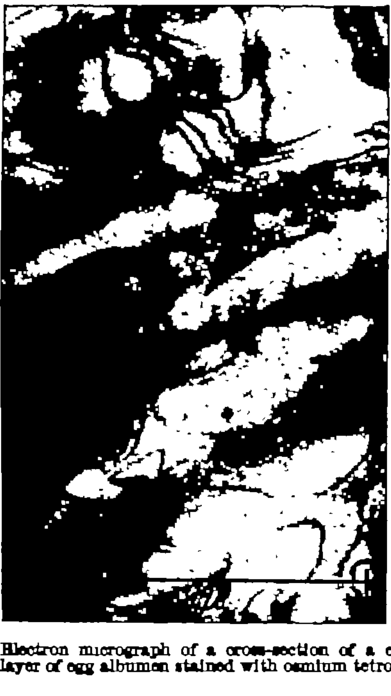

Fig. 1. Electron micrograph of a cross-section of a crumpled monolayer of egg albumen stained with osmium tetroxide

This work is part of an attempt to prepare artificial models of cell membranes. Multiple layers and tanned layers are also being examined. It is remarkable how closely some of the chance structures in these crumpled films resemble sections seen in electron micrographs of such organelles as the mitochondrion and the Golgi complex.

The work has been supported by grants to the Chester Beatty Research Institute (Institute of Cancer Research: Royal Cancer Hospital) from the British Empire Cancer Campaign, the Jane Coffin Childs Memorial Fund for Medical Research, the Anna Fuller Fund, and the National Cancer Institute of the National Institutes of Health, U.S. Public Health Service. I am indebted to Dr. R. J. Goldacre for many suggestions.

Ion Cyclotron Resonance

A CHARGED particle of mass m and charge e crossing a uniform magnetic field of strength H will describe a circular path with angular frequency $\omega = eH/mc$, independently of the particle's energy (c is the velocity of light). If such a particle is subjected to an alternating electric field, at the cyclotron frequency, perpendicular to the magnetic field, then absorption of energy from the electric field may be expected. A measurement of the frequency at which absorption takes place should therefore enable the mass of the resonating particle to be determined, given e, H and c, while the amount of absorption should provide information on the number of resonating particles present.

This technique has previously been successfully applied at frequencies corresponding to the electron cyclotron resonance, but so far has not been reported at frequencies corresponding to positive-ion cyclotron resonances in an ionized gas or plasma.

Recently, in this Laboratory, an experiment was performed with the object of detecting the cyclotron resonance for the positive ions in a discharge in hydrogen. A discharge was established in a tube containing hydrogen at low pressure, and a radial electric field at a frequency of about 750 kc./sec. was applied to the plasma. The tube was immersed in a longitudinal uniform magnetic field of approximately 500 gauss, superimposed on which was a sinusoidal magnetic field of amplitude of the order of 10 gauss at a frequency of 50 cycles/sec.

The resonance was detected by displaying the rectified signal, obtained from electrodes external to the tube, on a cathode-ray tube which was scanned at a frequency of 50 cycles/sec. On this cathode-ray tube a 'pip' was observed which behaved, with variation of frequency and of the modulation of the magnetic field, in the manner to be expected from a resonance. It is thought, therefore, that the absorption corresponded to the cyclotron resonance of the hydrogen atomic ions in the discharge. An attempt to detect the absorption corresponding to the cyclotron resonance of hydrogen molecular ions in the discharge was defeated by noise from the discharge.

Work to measure the characteristics of the resonance for various gases is in progress.

Excited Levels in Arsenic-75 produced by Radiative Capture of Protons by Germanium-74

DISCRETE energy-levels have been observed in arsenic-75 at excitation energies between about 8·0 and 10·0 MeV. The experimental procedure was as follows. Targets of separated germanium-74 of thickness 100 μgm./cm.^{2} and 10 μgm./cm.^{2} deposited on tungsten backings (prepared at the Atomic Energy Research Establishment, Harwell) were irradiated by the proton beam from a pressurized electrostatic generator[1], and the γ-rays emitted were detected by means of a thallium-activated sodium iodide crystal 36 mm. diameter by 25 mm. long coupled optically to a photomultiplier of type 6262*A*. The output from the photomultiplier was fed into a scaler via a cathode follower and linear amplifier of type 1008.

The energy of the incident proton beam was measured to an absolute accuracy of better than one part in a thousand, using an electrostatic analyser[2]. Care was taken to avoid the deposition of carbon on the target surfaces by placing a liquid-nitrogen trap immediately in front of the target, and ensuring that the target temperature did not fall below 200° C. during the irradiation[3].

The background due to the tungsten backing was estimated by irradiating a tungsten foil, and an approximate value for the cross-section of the ^{74}Ge($p\gamma$)^{75}As reaction was obtained by comparing the yield with that from the 1·348 MeV. resonance in the ^{19}F($p\gamma$)^{16}O reaction, using the same detection geometry and a calcium fluoride target of known thickness.

A total of twenty-five γ-emitting resonances was observed for protons in the energy-range 1·0–2·7 MeV. These are listed with half-width measurements in Table 1, and the yield curve is shown in Fig. 1. These measurements were all obtained on the 10 μgm./cm.^{2} target, the thickness of which, in energy units, was equal to between 1 and 2 keV. Corrections for target thickness have been made to the resonance values, which are accurate on the absolute energy scale to ± 2 keV. or better. The correction for the contribution due to target thickness[4] introduced large uncertainties in the estimation of the natural half-widths of some of the narrower resonances, and where this occurred, the measured half-widths have been given as an upper limit. Some uncertainty also occurs in the estimation of the half-widths of incompletely resolved resonances, and the values given may be in error by as much as ± 20 per cent.

Table 1

Resonant energies (MeV.)	Half-widths (keV.)	Arsenic-75 excitation energies (MeV.) 6·83 ± 0·15
1·006	<2·5	+0·993
1·094	9·5	1·079
1·167	4·5	1·151
1·218	<2·5	1·188
1·257	<2·5	1·240
1·332	5·0	1·314
1·422	<2·5	1·403
1·530	9·0	1·510
1·559	6·5	1·538
1·643	~15 incompletely resolved	1·621
1·665	~15	1·642
1·690	~30	1·667
1·806	20	1·781
1·906	~15 incompletely resolved	1·881
1·926	~15	1·900
1·972	85	1·946
2·074	18·5	2·047
2·161	~15	2·132
2·210	40	2·181
2·295	27	2·264
2·342	15	2·310
2·440	11	2·407
2·528	15	2·495
2·593	44	2·559
2·664	10	2·629

From isotopic mass measurements given by Wapstra[5], the Q value for the ^{74}Ge($p\gamma$)^{75}As reaction is calculated to be 6·83 ± 0·15 MeV. The competing reaction ^{74}Ge($p\alpha\gamma$)^{71}Ga is calculated to have a Q value of 1·38 ± 0·2 MeV., and this may also be accompanied by γ-emission. The ^{74}Ge(pn)^{74}As reaction is

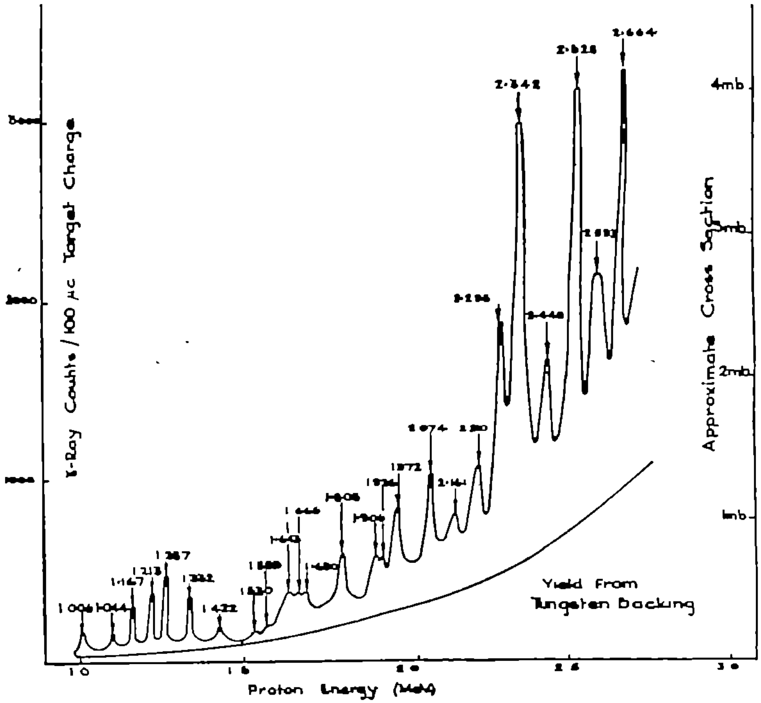

Fig. 1. Gamma-ray yield from 10 gm./cm.^{2} germanium-74 target irradiated by protons

calculated to have a threshold of about 3·8 MeV. No search has yet been made for α-particle emission, but a preliminary search for neutron emission, using a boron trifluoride counter with paraffin wax moderator, has failed to detect the presence of neutrons, and no activity of long life corresponding to the formation of arsenic-74 has yet been observed on the irradiated targets.

X-Ray Radiation Hazard using Vacuum Deposition Plant

It has been shown in a recent report by Strachan and Harris[1] that a sputtering plant operated at voltages as low as 8–10 kV. can give rise to X-radiation which can be dangerous to the operator. This observation was made with an apparatus different from the two-electrode system used for the deposition of thin films. Their apparatus consisted of a glass vessel in which positive ions formed in a discharge between an oxide-coated cathode and iron anode were accelerated to a target used for sputtering. It was shown that the X-rays arose from secondary electrons emitted from the target bombarding the walls of the glass envelope. It was possible to operate the main sputtering chamber at a lower gas pressure than normal because the ions were formed in an auxiliary discharge. Thus, the secondary electrons were able to reach voltages comparable to that of the ion-accelerating potential because of their long mean free-path. In a glow discharge the secondary electrons are required for ionizing the gas molecules and their final voltage is not that of the applied potential. Thus it is uncertain whether the results of Strachan and Harris would be directly applicable to a normal two-electrode system with a cold cathode operated at 8–10 kV.

Since the above report was published, I have received several queries as to whether X-radiation is emitted from normal vacuum deposition plant, and after discussion with workers at the Research Laboratories, General Electric Co., Ltd., it was decided to make radiation tests to ensure that such apparatus was safe. Radiation tests were made with Ilford *PMI* film in standard monitor holders using different types of deposition apparatus as described below.

It should be noted that the voltages given below for both the a.c. and d.c. high-tension supplies are root-mean-square values and the peak voltage encountered will be about 1·4 times the quoted values.

Initial tests were made with a cathodic sputtering apparatus and an electron-bombarded vapour source operating at voltages up to 4 kV. inside metal vessels with observation ports of plate-glass 9 mm. thick. In neither case did the monitor film show X-ray exposure after ten hours operation.

Work was then extended to apparatus operating at higher voltages inside glass vessels, such as that used for ionic-bombardment cleaning of glass before evaporation of thin films. At one time it was customary to use for this purpose high-reactance transformers giving some 10 kV., and as the discharge approached the 'blackout' condition the applied voltage rose to nearly the open-circuit value. In the vacuum apparatus at present designed by this Company, the maximum voltage used is 5·5 kV. and this is within the safe limit found by Strachan and Harris. However, it was of interest to know whether early vacuum plants were free from hazard.

A high-tension transformer giving 10 kV. open-circuit voltage was connected to two vertical electrodes insulated from earth and made from aluminium strip inside a 'Pyrex' bell-jar 18 in. diameter by 24 in. high. The wall thickness of the vessel was about 8 mm. Two test films were placed on the side of the vessel and one at a distance of 6 in. from the vertical side. The glow discharge was operated at 7 kV. and 8 m.amp. for 11½ hr. without X-ray exposure being observed. Two 10-kV. transformers were then connected with their output terminals in series and the apparatus again run for 8 hr. at 18–20 kV. and 20 m.amp. Again no X-ray hazard was observed.

Mr. Ball (G.E.C.), who kindly examined the monitoring film used in these tests, considers that if X-radiation was being generated then the energy was insufficient to penetrate the chamber walls. He states that a voltage of about 16 kV. is necessary for X-rays to penetrate 8-mm. thick 'Pyrex' glass in measurable quantities. This voltage would, of course, refer to electrons which struck the target, etc., with an energy equal to the applied potential, as must have occurred in the apparatus of Strachan and Harris, or could occur in thermionic devices operated at low gas pressures (for example, an electron-bombarded vapour source).

Acknowledgments are made to the Research Laboratories, General Electric Co., Ltd., for the help given in the tests and to Mr. A. S. D. Barrett, technical director of Edwards High Vacuum, Ltd., for permission to publish this communication.

Thallium-activated Sodium Chloride Recrystallization Phosphors

Investigations have been carried out with sodium chloride disks prepared in a pressure-range of 1,000–20,000 kgm./cm.^{2}. A few drops of an aqueous solution of thallium chloride were mixed with the sodium chloride powder before pressing. After ultra-violet excitation, the disks showed a good phosphorescence with a decay time of several minutes. The measurements were carried out with an *RCA* multiplier-tube type 931*A* and galvanometer.

Earlier optical and conductivity measurements showed that recovery takes place after the disks had been prepared. This recovery process can also be observed with the luminescent disks: the total light radiated gradually decreases with time.

After heat-treatment of the luminescent disks, the total light radiated decreases with increasing tem-

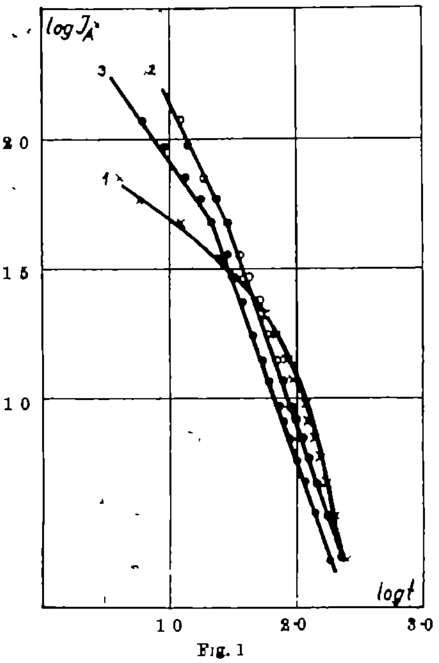

Fig. 1

perature (up to 300° C.) and then (300–600° C.) again increases.

In the case of thallium-activated sodium chloride disks, decay did not follow the well-known exponential law of thallium-activated sodium chloride single crystal phosphors. The shape of the brightness versus time curve is satisfactorily accounted for by a hyperbolic expression. Experiments were carried out with thallium-activated sodium chloride single-crystal phosphors grown from the melt. These crystals showed an exponential decay law; however, after the crystals had been deformed by stressing, the exponential law changed to a hyperbolic one (Fig. 1). When the decay of the phosphorescence is represented in a (log–log) diagram, as in Fig. 1, the exponential decay law is represented by curve 1, while the shape of the diagram becomes a straight line after the stress had been applied (curves 2 and 3). Hence it seems that dislocations may seriously affect the decay of phosphorescence.

A detailed account of this work will be published elsewhere. I wish to thank Prof. Z. Gyulai, who directed the investigation.

Reaction of Nitrates with Liquid Sulphur Dioxide

IT has been known for some time that inorganic nitrates catalyse the formation of polysulphones from liquid mixtures of olefines and sulphur dioxide[1], but the mechanism of catalysis has never been clarified. It is now suggested that the effective catalyst is nitrogen dioxide and/or the sulphite radical ion formed as the primary products of the reaction between nitrates and sulphur dioxide. The following observations are consistent with this suggestion:

(1) If sufficient silver nitrate is allowed to react with liquid sulphur dioxide, a brown gas appears but may, in time, disappear again. The brown gas is presumably nitrogen dioxide formed by processes such as $NO_3^- + SO_2 \rightarrow NO_2 + SO_3^-$, $NO_3^- + SO_3^- \rightarrow NO_2 + SO_4^{2-}$, and removed by further reactions with sulphur dioxide. In the presence of excess sulphur dioxide, the final products are likely to be nitrosyl pyrosulphate and nitric oxide[2], the overall reaction being:

$$6\,MNO_3 + 7\,SO_2 = 3\,M_2SO_4 + 2\,(NO)_2S_2O_7 + 2\,NO$$

It is worth noting that rapid oxygen atom transfer reactions such as $ClO_2^- + SO_3^{2-} \rightarrow ClO^- + SO_4^{2-}$ have been recognized[3].

(2) The observation of Dainton and Ivin[4] that the volatile products of the silver nitrate – sulphur dioxide reaction did not catalyse polysulphone formation is now consistent with this picture. Previously they had supposed that nitrogen dioxide was the end product.

(3) The only three completely soluble nitrates investigated by Snow and Frey[1] as catalysts for polysulphone formation were those of lithium, silver and ammonium, the efficiency increasing in that order. In liquid sulphur dioxide (dielectric constant 15·6 at 0° C.) the Bjerrum critical distance[5] for ion-pair formation is calculated to be 19·6 A. at 0° C. and it is to be expected that even with nitrate concentrations of 10^{-4} *M* there will be a considerable degree of association of the ions. Hence the rate-determining step for the initiation of polysulphone formation should probably be written as:

$$M^+NO_3^- + SO_2 \rightarrow M^+ + NO_2 + SO_3^-$$

The cation would be expected to affect the ease of release of the oxygen ion, and it is interesting to note that the catalytic efficiency increases with increasing size of the (crystallographic) cationic radius.

(4) Nitrogen dioxide is known to attack olefines[6]. The sulphite radical ion may equally well be the effective catalyst, since it has been shown to initiate the polymerization of styrene[7].

Attempts were made to follow the variation of the nitrogen dioxide concentration with time spectrophotometrically in mixtures of sulphur dioxide with ammonium or silver nitrate. These experiments were not successful, because of the very low solubility of the nitrates.

I thank Prof. F. S. Dainton for his interest in this work.

Interference in Soil Phosphorus Analyses by Snail Shells

IN some calcareous grassland soils in County Galway, certain fertility problems have been encountered with particular regard to soil phosphorus. While 'high' or 'very high' values for readily soluble phosphorus were sometimes obtained by routine analytical procedures[1], grazing and botanical observations indicated extreme phosphorus deficiency. Such

Table 1. VARIATIONS IN 'READILY SOLUBLE' PHOSPHORUS (USING MORGAN'S SOLUTION) IN SOIL CORES CONTAMINATED WITH SNAIL SHELLS

Core No.	Separate phosphorus extractions with Morgan's solution				
	1	2	3	4	Mean

3 (2–5 in.)	10·5	3·5	15·0	7·0	9·0
4 (0–2 in.)	5·0	3·5	6·0	6·8	5·3
4 (2–5 in.)	4·5	9·5	7·0	4·5	6·4
Surface shells	372	450	450	472	436

observations were verified by herbage analyses, where figures of the order of 0·10–0·11 per cent of the dry matter were obtained.

While investigating the above anomaly, it was observed that considerable quantities of small snail shells in varying stages of decomposition had become admixed with the soil in the problem areas. The predominant species have been identified as (1) *Helicella itala* (Linn.)—a circular shell of approximately ¼ in. diameter, and (2) *Helicella aspe. a*—a turret or spiral-shaped shell ¼ in. in diameter at the open end. The former, as is consistent with their life-history, were found at or just underneath the soil surface, while the latter were almost invariably found to have penetrated more deeply. While there was little evidence of either species during winter or spring, there was a striking appearance during the July–August period, when as many as ten per square yard was quite a common feature in certain areas, particularly in the vicinity of the outcropping limestone rocks.

Chemical analyses[1] showed levels as high as 3,200 p.p.m. total phosphorus in surface shells, while subsurface shells contained 900–1,000 p.p.m. total phosphorus. This indicated a likely source of phosphorus contamination during soil sampling. To ascertain the resultant effect on routine chemical analyses, four cores of soil, each 3 in. in diameter and 5 in. in depth, were extracted from a typical area in close proximity to one another. Each core was subdivided into 'surface' (0–2 in.) and 'subsurface' (2–5 in.) samples. Four subsamples of each were extracted with Morgan's solution using a 5 : 1 extractant/soil ratio. The results are shown in Table 1 and are contrasted with samples of surface shells which were ground up and treated as soils.

Table 1 shows considerable variation in the quantity of phosphorus released, not only from the different cores removed from contiguous positions in the field, but also an important difference even in the subdivided cores themselves. It is likely that this inconsistency is due to the contamination of readily extractable phosphorus which the shells contain. It should be pointed out that 'surface shells' (Table 1) refers to both the snail and the shell. An analysis of the shells alone showed a phosphorus level of 168 p.p.m. with Morgan's solution, which may be considered as entirely calcium-bound phosphorus.

Thus considerable soil sampling problems are posed in areas where snail infestations occur to the extent reported here. I wish to acknowledge the helpful assistance of the Department of Zoology, University College, Dublin, for information on the identification and life-history of the *Helicella* spp.

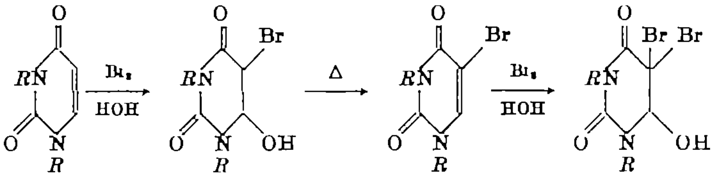
Reaction of Bromine with Uracils

SOME interesting observations on the reaction of bromine with pyrimidine compounds were recently reported by Cohn[1]. Since 1907, when Wheeler and Johnson[2] first observed the coloured reaction product obtained by the action of bromine with uracil or cytosine and isolated the intermediate, the bromine reaction has been utilized for structural determinations, analyses and the preparation of derivatives[3]. In 1940, Johnson concluded that "5,5-dibromo-4(6)-hydroxyhydrouracil decomposed spontaneously and quantitatively to 5-bromouracil and HOBr"[4]. I have been unable to confirm this observation. Due to the renewed interest in pyrimidine chemistry and the discrepancies concerning the bromine reaction which have appeared in the literature, I wish to propose a mechanism for this reaction based on the experiments described below.



(I) (II) (III) (IV)

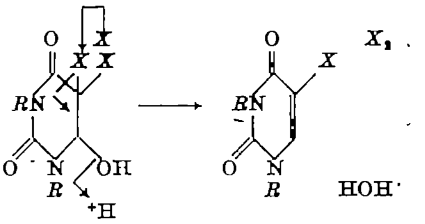
(*A*) R = H; (*B*) R = CH_3

The addition of one mole equivalent of bromine water to uracil or 1,3-dimethyluracil resulted in the formation of 5-bromo-6-hydroxyhydro-derivatives (II*A* or II*B*) in the solution, which lost its ultraviolet spectrum[5]. However, on standing or heating, 5-bromouracil (III*A*, found: Br, 41·51; N, 14·31 per cent; λ(H_2O max.) 276 mμ, ε 7·2 × 10^3; λ250/λ260, 0·55; λ280/λ260, 1·47) or 5-bromo-1,3-dimethyluracil (III*B*)[6] was formed. The dehydration proceeded spontaneously and quantitatively and thus provided an excellent method for the preparation of III. When a second mole equivalent of bromine was added to III*A* or III*B*, 5,5-dibromo-6-hydroxyhydrouracil (IV*A*, found: Br, 54·05 per cent, crystallized from water, $C_4H_4N_2Br_2O_3 . \frac{1}{2}H_2O$; melting point, 210°; found: Br, 55·12 per cent, crystallized from acetone–petroleum ether; melting point, 210°) or 5,5-dibromo-6-hydroxy-1,3-dimethylhydrouracil (IV*B*, found: Br, 49·15 per cent, crystallized from water; $C_6H_8O_3N_2Br_2 . \frac{1}{2}H_2O$; melting point, 136–37°; found: Br, 50·5 per cent, crystallized from acetone–petroleum ether, melting point 139–40°) was formed.

IV*A* and IV*B* in aqueous solution (2 × 10^{-3} *M*) were refluxed for eight hours or more and gave at 275 mμ, ε 3·9 × 10^3 and 280 mμ, ε 3·4 × 10^3 respectively, thus indicating about 50 per cent conversion to III*A* and III*B*. These were confirmed by the isolation and identification of III*A* (λ250/λ260, 0·54; λ280/λ260, 1·45; and III*B* (mixed melting point, 184–85°, λ250/λ260, 0·48; λ280/λ260, 0·25). This suggested that hydrogen bromide, resulting from the hydrolysis of IV*A* and IV*B*; catalysed the formation of III*A* and III*B*. When IV*A* and IV*B* were refluxed for 24 hr. or more at a concentration of 1×10^{-4} *M*, no increase in ultra-violet absorption at any time was observed. However, when the reaction was carried out in 2 *N* hydrochloric acid or 2 *N* hydrobromic acid, the absorption at 280 mμ gradually increased to more than 80 per cent of that for III*A* and III*B* at the end of 8 hr. These observations indicate that III is formed from IV only when *HX* is present, and I cannot wholly agree with the following statement made by P. A. Levene[3]: "The original product which forms immediately on addition of (excess) bromine (to uracil) is undoubtedly 5,5-dibromo-4(6)-hydroxhydrouracil. This compound is then transferred into 5-bromouracil".

Since most workers have been under the impression that IV is highly unstable (which belief now appears untenable), they used the method of Levene[6] for the preparation. This method requires the addition of bromine until the colour of the solution remains permanently yellow. However, I observed that if the reaction is carried out at or below room temperature, the yellow colour appears after one mole equivalent of bromine has been added. Thus the isolation of IV is not possible under these conditions. I found that the uracil derivatives and the 3-substituted uracils, for example, 1,3-dimethyluracil, show the same chemical behaviour throughout.

I suggest that IV is formed from III, and III in turn is formed from II. The reaction catalysed by *HX* for the formation of III from IV is illustrated as:



The detailed results of the work and the lability of IV in weak base together with the formation of 5-hydroxyuracils from their corresponding 5-bromouracils will be reported elsewhere. The work was done under the terms of Contract *AT*(30–1)–911 of the Physiology Department, Tufts University School of Medicine, with the Atomic Energy Commission. I thank Margarita Apicella and Ruth Weintraub for their technical assistance.

A Modified Nagler Medium

HAYWARD[1] suggested in 1941 that the Nagler reaction might be used for the rapid identification of *Clostridium welchii*. She expanded this work later[2] and directed attention to the difficulty of distinguishing between *Cl. welchii* and *Clostridium bifermentans* on serum agar plates. Both these organisms produced opalescence in the medium, and it was inhibited by *Cl. welchii* antitoxin. She suggested that distinction between these organisms may be made by making use of the hydrolysis of phenolphthalein phosphate as described by Bray and King[3].

Since *Cl. welchii* is a lactose-fermenting anaerobe and *Cl. bifermentans* is a non-lactose fermenter, the incorporation of lactose and neutral red into the Nagler medium should provide a means of distinguishing between them on a single plate culture.

A modified Nagler medium using egg-yolk instead of serum was therefore prepared in a meat infusion agar base[4], to which was added 1 per cent lactose and 0·03 per cent neutral red. Plates of this medium were spread on one half with *Cl. welchii* type *A* antitoxin, inoculated and incubated anaerobically.

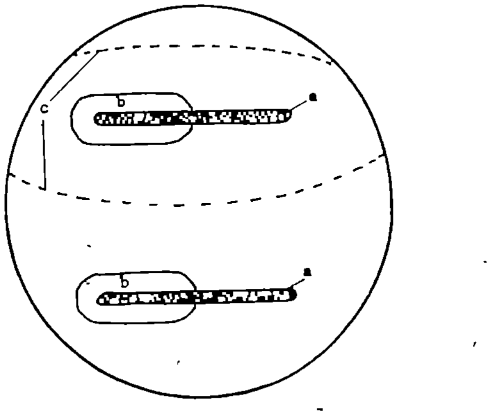

Fig. 1. Diagram of plate cultures of *Cl. welchii* (upper half) and *Cl. bifermentans* (lower half) on the half-antitoxin egg-yolk lactose medium. Antitoxin on right half of plate. (*a*) Streak culture of organism; (*b*) zone of opalescence; (*c*) limits of red halo

Preliminary trials with a number of strains of *Cl. welchii* types *A* to *E* and *Cl. bifermentans* have shown that distinction between these organisms on this medium is readily made (Fig. 1). *Cl. bifermentans* produces opalescence which is inhibited by *Cl. welchii* type *A* antitoxin. *Cl. welchii* types *A*–*E*, in addition to producing opalescence which is inhibited by antitoxin, also produces a distinct pink or red halo in the medium surrounding the opalescence zone. This red zone is due to acid produced by fermentation of the lactose. All strains of *Cl. welchii* and *Cl. bifermentans* so far tested have consistently produced the reactions described, and a diagnosis could be made in all cases after anaerobic incubation for 12–18 hr. Since *Cl. welchii* is the only lactose-fermenting clostridium which produces lecithinase, the production by an anaerobe of opalescence inhibited by *Cl. welchii* type *A* antitoxin together with a red halo is diagnostic of *Cl. welchii*. The medium should therefore be of value in detecting *Cl. welchii* in mixtures with other organisms.

Further investigations along these lines are at present being made and will form the basis of a subsequent communication.

Proteolysis of Collagen

IT was shown by Linderstrøm-Lang and co-workers[1] that the tryptic hydrolysis of β-lactoglobulin involves the reversible denaturation of the protein as a preliminary stage. A consideration of known facts, together with new evidence obtained in connexion with an investigation of the mechanism of bating of skins in leather manufacture[2], indicates that collagen and procollagen are also denatured by the enzyme prior to hydrolysis. Bating is a process in which skins, after liming and deliming, are treated with a proteolytic enzyme (usually trypsin) in order to produce a soft leather. The process has been shown to involve the removal of degraded collagen (a form of collagen in which the fibrillar structure has disintegrated and which has been named 'progelatin'[3]) produced by the swelling action of lime, and is normally carried out at about 37° C. Temperature control is critical since little or no action takes place below 35° C., and above 40° C. rapid digestion of intact collagen occurs, leading to a loss of leather-making substance. The lower limit is explained by the fact that progelatin must be converted into gelatin before it can be hydrolysed by the enzyme. If, however, the skin is heated to 40–45° C. before adding the enzyme, bating can be carried out at a much lower temperature, for example, at 27° C. in about twice the time required at 37° C., which is in accord with the temperature coefficient of proteolytic enzymes acting on gelatin[3]. The higher temperature required to heat the progelatin in the absence of enzyme than in its presence is indicative of a denaturation stage which can be catalysed by the enzyme. As denaturation is believed to involve rupture of hydrogen bonds between parallel molecular chains, the enzyme functions as a hydrogen bond breaker in a similar manner to chemicals such as alkali, urea, potassium thiocyanate, etc.

Hydrogen bond breaking by chemicals can be followed by the decrease in hydrothermal shrinkage temperature (T_s), but fails with proteolytic enzymes since denaturation is immediately followed by hydrolysis, so that shrinkage does not occur. It is impossible to wash out completely or inactivate the enzyme adsorbed on the collagen, which is remarkably stable so that even plunging the enzyme-treated collagen into boiling water results in appreciable hydrolysis before the enzyme is inactivated[4]. Any chemical treatment that lowers the T_s of collagen results in an increased rate of attack by trypsin at 37–40° C. because the activation energy for enzyme denaturation is reduced. Various native fish collagens are attacked by trypsin at temperatures related to their hydrothermal shrinkage temperatures[5]. Fish collagens are believed to differ from mammalian collagen principally in the degree of hydrogen bonding[6] and so behave similarly to chemically treated mammalian collagen.

Size and Shape of Cartilage Mucoprotein

THE chondroitin sulphate – protein complex of cartilage was extracted from fresh homogenized bovine nasal septa by 30 per cent potassium chloride and precipitated with absolute alcohol after dialysis against running tap water and addition of potassium acetate; all operations were carried out at 2° C. The final product was analogous in chemical composition to the mucoprotein of Shatton and Schubert[1]. Solutions of the mucoprotein in phosphate buffer $M/15$, pH 7·0, were studied by viscometry, sedimentation, light scattering and flow birefringence.

The viscosimetric measurements were carried out at a velocity gradient $G = 0{\cdot}246$ sec.$^{-1}$ in a Couette apparatus; the intrinsic viscosity at 25° C. was $[\eta] = 207$ C.G.S. units. The sedimentation coefficient at infinite dilution and 20° C. was $s_0 = 6{\cdot}85 \times 10^{-13}$ C.G.S. units; the considerable spreading of the sedimenting boundary suggested a wide polydispersity of the mucoprotein. Determinations of light-scattering at $\lambda = 5460$ A. (the specific refractive index increment was $dn/dc = 0{\cdot}1680$ per gm./ml.) gave the following results: $M_w = 1{\cdot}98 \times 10^6$; $I_{45}/I_{135} = 2{\cdot}18$; $R_z = 1180$ A. (R_z being the Z-average radius of gyration); the anisotropy was negligible.

I have carried out the double extrapolation (to zero angle and zero concentration) of the Zimm plot obtained in the diagram $P^{-1}(\theta)$ vs. μ^2R^2 ($\mu = \frac{4\pi}{\lambda'} \sin\frac{\theta}{2}$, λ' being the wave-length of light in the solution, θ the angle between the incident and scattered beams) in order to compare the plot with the curves pertaining to spheres, coils and rods, respectively; it is known[2] that the curves relating to polydisperse systems fall below those of monodisperse systems (the latter are shown in Fig. 1).

As is evident from Fig. 1, the sphere model seems to be quite improbable; furthermore, it would require a hydrated specific volume (as deduced from R_z) of $V' = 4{,}450$ ml./gm., which appears to be much too high. A polydisperse system of rods, such as was suggested by Mathews and Lozaityte[3], though not incompatible with the light-scattering results, seems also highly improbable. The length of the rods (as deduced from R_z) would be about 4000 A.; such a system could scarcely fail to exhibit a strong flow birefringence, like, for example, tobacco mosaic virus (this latter presents an intrinsic streaming birefringence $[\Delta n] = \lim_{\substack{G \to 0 \\ C \to 0}} \frac{\Delta n}{G\eta_0 C} = 5 \times 10^{-4}$); in the case of cartilage mucoprotein, on the contrary, the flow birefringence was negligible ($[\Delta n] < 10^{-6}$), a result which is in agreement with the negative results of Webber and Bayley[4] for an analogous product.

The hypothesis of a polydisperse system of coils seems to be the most satisfactory. My light-scattering results also indicate the absence, or at most a very small extent, of branching in the mucoprotein; indeed, Benoit[2] showed that branching increases the general upward curvature of curve 2, whereas my curve 4 exhibits a strong downward curvature. The possibility of a system of non-Gaussian coils, which could also explain such curvature[5], seems to be ruled out by the high value of the ratio L/r (L being the length of the filament and r the root-mean-square end-to-end distance of the coil).

On the assumption of such a polydisperse system of coils, I can, by the method of Sadron and Benoit[6], calculate the approximate value of M_n (strictly speaking, its upper limit); I have found M_n = 480,000; therefore, $M_w/M_n > 4$, a result which confirms the polydispersity observed in the sedimentation.

In order to check the mutual consistency of my experimental results as well as my conclusions, I applied the following equation proposed by Flory[7]:

$$\Phi^{1/3} P^{-1} = \frac{N s_0 [\eta]^{1/3} \eta_0}{M^{2/3} (1-\bar{v}\rho)},$$

where $\Phi^{1/3} P^{-1}$ should be a universal constant independent of solvent, temperature and nature of polymer. Introducing in the above equation my values of s_0, M_n, $[\eta]$ and assuming $\bar{v} = 0{\cdot}60$ ml./gm., I find $\Phi^{1/3} P^{-1} = 2{\cdot}1 \times 10^6$; the good agreement between this value and the theoretical one seems to confirm the consistency of the experimental results and the validity of the proposed model.

Ion Permeability of the Plasmalemma of the Plant Cell

It has recently been suggested by several workers[1] that the plasmalemma of the plant cell does not constitute a barrier to the diffusion of ions, and that there is a Donnan distribution of ions between the cytoplasm of the plant cell and the extracellular medium. As a corollary, it has been suggested[1c] that the electric resistance and capacity of plant tissue are to be attributed wholly to the properties of the tonoplast and bulk cytoplasm. However, it has been suggested that recent measurements of resistance and capacity on *Nitella* give the properties of the plasmalemma[2]; and d.c. measurements on *Chlorella*[3], which has no significant vacuole, appear to require a similar explanation. Results which I have obtained with cells of *Nitella* indicate that the plasmalemma of the *Nitella* cell acts as a barrier to the inward diffusion of calcium ions, and is responsible for the d.c. resistance of the cell bathed in a solution of potassium, sodium or calcium chloride. Thus if the cytoplasm contributes to the apparent free space for ionic diffusion, it cannot be in the simple way proposed for higher plant tissue[1]. Although one cannot argue from single cells of an alga to pieces of angiosperm tissue, it may be noted that there is evidence from *Nitella* that labelled ions do cross the plasmalemma much more rapidly than the tonoplast[4]; this situation is comparable with that in angiosperm tissue[1c].

Microelectrode experiments on *Nitella*[5] showed that the electric potential difference between cell sap and extracellular medium is located at the plasmalemma, the value being −160 mV. (interior negative) with the cells bathed in 0·1 m*M* potassium chloride solution. The location of the p.d. and its value were qualitatively in agreement either with the hypothesis of a Donnan distribution across a freely permeable plasmalemma, or with hypotheses involving a semi-permeable membrane. Further experiments by the same method (Walker, N. A., and Cooper, J., unpublished work) have, however, found a p.d. of −160 mV. across the plasmalemma of similar cells bathed in their native pond water. Flame photometer analysis of this pond water gave the following (rounded-off) results:

$$[K^+]_o = 0{\cdot}03 \text{ m}M\,;\ [\text{Na}^+]_o = 0{\cdot}5 \text{ m}M\,;\ [\text{Ca}^{++}]_o = 0{\cdot}5 \text{ m}M$$

It will be sufficiently accurate if these concentrations are taken as equal to the activities. If now there is a Donnan distribution (or, more generally, if there is electrochemical equilibrium) across the plasmalemma for these ions, one can calculate their activities in bulk cytoplasm from the equation:

$$a_{cj} = a_{oj} \exp(-Z_j E/58)$$

where a_{cj} and a_{oj} are the activities of the jth ion in bulk cytoplasm and outside medium respectively, Z_j is the valence of the jth ion, and E is the electric p.d. between the two phases in millivolts. This calculation, for the cells in pond water, gives the following results:

$$a_{cK^+} = 18 \text{ m}M\,;\ a_{cNa^+} = 300 \text{ m}M\,;\ a_{cCa^{++}} = 180{,}000 \text{ m}M$$

The value for the calcium ion activity is absurd, so that this ion cannot be in electrochemical equilibrium across the plasmalemma. It is most improbable from energy considerations that this is due solely to the existence of a 'calcium pump', so that a degree of impermeability of the plasmalemma to calcium is very probably involved. The calculated values for potassium and sodium activities are not obviously impossible, and no conclusion is drawn from them. However, it seems from the time taken by labelled potassium and sodium to enter the cytoplasm[4] that the plasmalemma is also somewhat impermeable to these ions. This has been confirmed by the experiments reported below.

Microelectrodes have been inserted into the cell, as previously described[5], to measure the direct current resistances of the cell membranes in *Nitella*. A known direct current (generally 10^{-8} amp.) was passed across the protoplasm from one microelectrode with its tip in the vacuole to a salt bridge in contact with the bathing solution. A second inserted microelectrode enabled changes of p.d. due to the impressed current to be measured, either between the cytoplasm and the outside medium or between the cell sap and the outside medium. Ohm's law then gave the resistance from the measured change in p.d. and the current. As the indicating instrument was a galvanometer of 2-sec. period, transient p.d.'s due to the membrane capacity of the living cell[6] were not observed when the current was switched on or off. Reversing the direction of the current did not alter the measured resistance by more than 10 per cent. The measured value was corrected for the resistances of the bathing solution, the indifferent electrode and the potentiometer. These were the only resistances common to the current and potential circuits, apart from the resistance to be measured.

On seven occasions, in experiments on five cells, it was possible to measure the two required resistances within a short interval of time. The values in ohms × 10^3 are:

Resistance vacuole to outside (R_{vo})	340	320	260	470	860	200	460
,, cytoplasm ,, (R_{co})	330	310	260	300	710	190	360

Thus in every case the major part (75–100 per cent) of the d.c. resistance of the cell lay between the cytoplasm and the outside medium. These experiments were carried out with the cell in the following bathing solutions: 1·0 mM sodium chloride; 1·0 mM potassium chloride; 0·05 mM and 0·5 mM calcium chloride. The general conclusion is thus true of cells in these various solutions. (This variation in the composition of the bathing solutions, and variation in the sizes of the cells and their histories, account for much of the variation in the values quoted.) The resistance of the layer of cytoplasm 10µ thick is negligible compared with these values, whether one accepts the results of a direct measurement[7], or makes any plausible guess as to the free-ion concentration in cytoplasm. It therefore seems certain that the measured d.c. resistance (R_{co}) is located at the plasmalemma, and so presumably is also the major part of the a.c. resistance[2]. Calculation indicates that the current distribution is reasonably uniform over the cell surface, so that the specific resistance of the membrane may be found from the product of the measured resistance and the area of the cell surface. A representative value so found for these experiments is 6,000 ohm sq. cm., which is lower than the d.c.[6] and a.c.[2] values previously reported, presumably due to differences in species and history of the cells.

It seems anomalous that the plasmalemma should have a higher electric resistance than the tonoplast, if it permits the more rapid salt penetration. Most of the ions crossing the plasmalemma in ion uptake or exchange must be unable to carry an electric current, that is, must be part of a neutral complex. This can occur if the membrane contains a lipid layer, as has often been suggested. Such a layer would contain few free ions to carry an electric current, but might contain sufficient carrier to provide high entry and exchange rates for ions. The carrier molecules would be required to cross the lipid layer always in an uncharged form. As a result, no direct relation would exist between the salt permeability and the electric resistance of the membrane. This model best explains observations on *Nitella* discussed here.

I thank Dr. J. N. Phillips, Mr. C. G. Greenham and Dr. B. I. H. Scott for helpful discussions and suggestions. This work will be fully reported elsewhere.

Efficiency of Ion Transport in Biological Systems

THE idea that active ion transport is linked directly to an electron-transferring respiratory system was first expressed clearly by Stiehler and Flexner[1] and has since been elaborated by other investigators[2,3]. On the basis of this hypothesis, the maximum value of the ratio (ion pairs transported/oxygen consumed) = 4 [4,5], since four electrons are transferred in the reduction of one molecule of oxygen to water. In support of the theory, Robertson and Wilkins[5] showed experimentally with slices of carrot tissue that the ratio approached but did not exceed 4 as the concentration of salt in the medium was increased.

More recently, however, evidence has been accumulating that the ratio can exceed 4 in both animal and plant systems. Crane and Davies[6] claimed that (hydrochloric acid secreted/oxygen involved) in frog gastric mucosa can be maintained at values exceeding 11 for considerable periods of time. Leaf and Renshaw[7] found with isolated frog skin that the number of sodium ions transported per oxygen molecule consumed ranged from 2 to 13, with a mean value of 6·82. On the assumption that only a part of the oxygen taken up by the tissue is involved in ion transport, 6·82 represents a minimum value, and the actual ratio may be as high as 18. Handley and Overstreet[8], studying the relation between respiration and salt absorption in excised barley roots, obtained values for (anions absorbed/oxygen involved) = 4·3–7·9 in potassium bromide solutions; 2·8–4·6 in sodium bromide solutions; and 0·3–18·7 in calcium bromide solutions. One of us (J. F. S.) obtained (anions absorbed/oxygen involved) > 4 with red beet root slices immersed in solutions of sodium chloride at low temperatures (3°–5° C.), although at 25° C. under otherwise similar conditions values of 2–3 were obtained.

It appears, therefore, that mechanisms of ion transport which depend on a direct linkage to electron transfer, such as the Lundegårdh hypothesis and the 'redox pump', must be rejected. An alternative hypothesis is that ion secretion and accumulation depend on the utilization of energy from phosphorylated compounds. On the assumptions that one high-energy phosphate bond ($\sim$ P) is utilized in the transport of only one ion pair, and that a net 38 ($\sim$ P) are produced from the complete oxidation of a mole of glucose, the maximum value for (ion pairs absorbed/oxygen involved) $\simeq$ 6·3. The average P/O ratio for the complete oxidation of pyruvate by isolated mitochondria[9] is 3, which would give a maximum P/O_2 or anions/oxygen ratio of 6. These considerations suggest that experimental anions/oxygen values close to 4 are approaching 60 per cent, rather than 100 per cent, of the theoretical maximum. If a finite number (>1) of ion pairs are transported per $\sim$ P the maximum value of (ion pairs absorbed/oxygen involved) will be a simple multiple of approximately 6. With plant tissues, the ratio is usually much lower than 6 (< 1 in wheat roots[10]), and this probably means that only a small fraction of the respiratory energy is utilized for accumulation. On the other hand, the fact that values of up to 18 have been obtained with both animal and plant materials suggests that at least three ion pairs may be transported per $\sim$ P under optimum conditions.

There are a variety of ways in which the energy stored in phosphorylated compounds could conceivably be utilized in ion transport. In general terms, phosphorylation may facilitate binding of the ion to its carrier, or it may be involved in the physical movement or in the subsequent breakdown of the ion-carrier complex. Some specific hypothetical mechanisms depending in various ways on the utilization of 'high-energy' phosphate compounds have been suggested[11–13] but at present these lack experimental proof.

It must be emphasized that the hypothesis linking ion transport to phosphorylation is not contradicted by any of the evidence assembled in support of the Lundegårdh or Conway hypotheses, since reduced respiratory intermediates and the cytochrome system are essential for the aerobic synthesis of adenosine triphosphate. The observation[14] that 2,4-dinitrophenol at certain concentrations stimulates electron transport and at the same time depresses salt absorption argues strongly against oxidation/reduction hypotheses, and favours a phosphorylation mechanism, since it is known that 2,4-dinitrophenol prevents adenosine triphosphate synthesis. Stimulation of respiration by added salts (the 'anion respiration' of Lundegårdh) can be explained if it is assumed that the adenosine diphosphate/adenosine triphosphate ratio in the cell controls the rate of oxidation. When energy (adenosine triphosphate) is utilized in the absorption of salt, it is probable that the increase in adenosine diphosphate concentration results in a stimulation of oxygen uptake[15].

Finally, a phosphorylation mechanism provides a unified hypothesis applicable to ion transport in anaerobic as well as aerobic systems, since phosphorylated compounds synthesized in fermentation may also supply energy for secretory processes.

Fungistasis as a Factor in the Rhizosphere Phenomenon

IN the course of work in progress on soil inhibitory factors, it has been observed that the spores of certain fungi which are unable to germinate when introduced into fresh fertile soil on glass slides coated with 0·5 per cent peptone in 2·0 per cent agar, owing to the presence in the soil of a fungistatic factor, may germinate readily when seedling roots grow in their immediate vicinity, that is, within a distance of some 2 mm. This observation has been made with conidia of *Gliocladium roseum* and *Paecilomyces marquandii* on glass slides buried beneath germinating peas so that the seedling roots grew into contact with the slides; and also with *Fusarium solani* and two unidentified isolates of *Fusarium* in similar experiments using seedlings of pea, wheat and lettuce. *Fusarium*

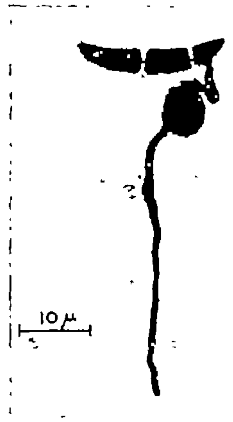

Fig. 1. Conidium of *Fusarium solani* that has produced a chlamydospore after being buried in soil. The latter has since germinated owing to the growth near it of a pea root

solani and one of the unidentified *Fusaria* show peculiar behaviour; in the presence of soil their conidia germinate normally, but usually produce terminal chlamydospores on short germ tubes and cease further development. Park[1] has reported similar formation of chlamydospores by *Fusarium roseum* in response to an inhibitory factor produced by *Bacillus macerans*. In the presence of seedling roots the chlamydospores germinate and growth is resumed (Fig. 1). According to the abstract of a thesis by Burke[2] on root rot of *Phaseolus vulgaris*, *Fusarium solani* f. *phaseoli* may exhibit the same type of behaviour in naturally infested root-rot soils. It has further been observed with *Gliocladium roseum* and with the *Fusaria* studied that the germ tubes show a strong tropic growth towards the roots, although those of *Paecilomyces marquandii* do not appear to show such directed growth.

While no definite explanation for the germination of previously inhibited fungal spores can yet be offered, it would seem likely that root excretions are involved. Rovira[3] has demonstrated the liberation of easily detectable quantities of sugars, including glucose, by the roots of pea and oat seedlings, and the previously reported effect of low concentrations of glucose in overcoming soil fungistasis[4] has been confirmed and extended to other sugars in the present work.

The rhizosphere effect is usually believed to be due primarily to the direct nutritional influence of substances liberated by roots and of sloughed-off root tissues. The indirect effect of root exudates in stimulating the germination of fungal spores which have been lying in the soil in a condition of environmental dormancy is likely to precede and to be of equal importance to any direct nutritional effect. The tropic growth of germ tubes towards the roots, added to the germination followed by vegetative growth and sporulation of spores on, and very close to, the roots, would contribute to the relative abundance of fungi in the rhizosphere and on the root surface as compared with soil away from the roots.

Ovicidal Action of Organo-phosphorus Insecticides

THE response of insect eggs to organo-phosphorus insecticides presents anomalies for the hypothesis that these compounds exert their toxic effect by inhibition of the acetylcholinesterase of the nervous system. In the first place, the compounds are toxic to eggs treated before differentiation of the nervous system[1]. Secondly, eggs treated at an early state of development, before cholinesterase activity appears, continue to develop normally until just before hatching, and then die[2]. Since the ultimate toxic effect of anticholinesterases is thought to result from the abnormal concentration of acetylcholine, we have examined the acetylcholine content and cholinesterase activity during the embryonic development in normal and treated eggs of the housefly, *Musca domestica*. Our results show a striking coincidence between the appearance and rise in the acetylcholine content of *Musca* eggs and the lethal action of the organo-phosphorus insecticide parathion.

Musca eggs at 28° C. normally complete their embryonic development and hatch in twelve hours after oviposition. Large numbers of eggs were collected at timed intervals from 1 to 11 hr. after oviposition and assayed for acetylcholine using the frog's rectus abdominis muscle[3], and for cholinesterase activity by the standard manometric method (sodium bicarbonate, 0·025 *M*; acetylcholine, 0·01 *M*; temperature, 37° C.). Eggs were treated within one hour after oviposition by exposure on filter-papers treated with a 2 per cent acetone solution of parathion for a period of one hour. In conformity with Smith's observations[2] on peach tree borer eggs, we regularly observed that eggs treated in this way continued to develop normally until hatching, and then failed to emerge.

Table 1. ACETYLCHOLINE CONTENT AND CHOLINESTERASE ACTIVITY OF NORMAL AND PARATHION-TREATED EGGS OF *Musca domestica*

Age of eggs (hr.)	Acetylcholine content (μgm./gm.)		Cholinesterase activity (μl. CO_2/125 mgm./hr.)	
	Untreated	Treated	Untreated	Treated
1–3–5	nil	nil	nil	nil
7	nil	nil	14·9	—
9	5	7	18·8	—
11	490	742	26·5	Complete inhibition

Table 1 shows that neither acetylcholine nor cholinesterase activity could be detected during the first five hours of development. At seven hours, cholinesterase activity appeared in untreated eggs and increased up to the time of emergence. Acetylcholine was first detected in untreated eggs at nine hours and then increased to nearly 500 μgm./gm. during the next two hours. This extraordinary increase in the acetylcholine contents of developing *Musca* eggs was verified in four separate experiments, and gives credence to the high values reported by Yushima and Chino[4] for the acetylcholine content of certain insect eggs. We confirmed that the substance assayed on the rectus abdominis muscle of frog was in fact acetylcholine by (*a*) its reaction with hydroxylamine-ferric chloride[5] and (*b*) by paper chromatography[6]. Eggs treated with parathion showed the same time-course of appearance and rise in acetylcholine, but the values obtained were about 50 per cent higher than in untreated eggs. This increase in acetylcholine content after treatment with anticholinesterases has also been demonstrated in adult houseflies[7]. The cholinesterase activity of the treated eggs was completely inhibited.

These findings seem to resolve the anomaly of the delayed action of anticholinesterases on insect eggs. If the ultimate toxic agent in anticholinesterase poisoning is acetylcholine, then no mortality would be expected during early embryonic development before this substance is present. However, late in development and coincidental with the time of hatching, high concentrations of this substance are present. If, at this time, the normal controlling mechanism, cholinesterase, is inhibited, the embryo is exposed to these high concentrations of acetylcholine and death ensues.

Hens with Bilateral Oviducts

As the reproductive organs of the female chicken develop there is an atrophy of the right gonad and the right oviduct which begins during early embryogeny. Persistency of these structures on the left side results in only one functional ovary and oviduct. A suspicion that bilateral oviducts were present in an inbred strain of Rhode Island Reds resulted when hens were being artificially inseminated. As each hen was prepared for receiving semen, manual pressure was exerted so that the vagina would be extruded. When this practice was followed with line *SD*-11 hens (from the Rhode Island Red inbred line) it was frequently observed that apparently two vaginas were appearing at the cloaca. Subsequent autopsies have verified that at least a portion of the right oviduct has persisted in some of the *SD*-11 hens.

Between August 15 and November 1, 1956, nine mature *SD*-11 hens were autopsied. Six of the hens had abnormal reproductive structures on the right side. The rudimentary right oviducts were, in all instances, attached to the cloaca in a manner similar to that of the normal left oviducts. The measured lengths (see Table 1) indicate that in four of the six cases the rudiment was approximately half the length of the normal duct. Gross examination revealed that the following areas of the right oviduct had not been subjected to normal avian degeneration during development: vagina, uterus, isthmus and part of the magnum. The two shorter rudiments each had a cystic mass appended distally. The thin-walled mass of female $322D^*$ was approximately 12 mm. × 8 mm. and that of female 5741*E* was approximately 28 mm. in diameter. Macroscopically the tissue of the right oviducts appeared similar to that of the left oviducts, except for one female. In 3088*E* the tube was tough and fibrous, suggestive of a fibroma. In none of the females was a right ovary observed.

Table 1. Oviduct Lengths (in mm.) for Nine Non-laying Mature Rhode Island Red Hens

Hen No.	Left oviduct	Right oviduct
322*D*	100	25
366*D*	110	60
377*D*	125	60
1703*E*	110	*
3088*E*	100	65
4583*E*	110	55
4677*E*	110	*
4685*E*	110	*
5741*E*	100	30

* Normal, unilateral reproductive structures.

Persistency of the right oviduct in chickens, or of its rudiments, has been reported in isolated cases[1]. Although Wodzicki[2] has reported that the right oviduct tends to persist in ducks, there appears to be no report in the literature indicating that the persistency of the right oviduct is inherited in chickens. Development of the right ovary in hawks and falcons[3] has apparently little or no relation to growth of the right oviduct[4]. Thus, although rare instances of dual persistency have been reported[5], it is not unusual to observe that the normally absent oviduct can persist without the corresponding ovary. Because of their separate embryonic primordial origin, this would be expected.

Line *SD*-11 has, for eleven years, been developed under a designed inbreeding programme. The present coefficient of inbreeding is 70 per cent < 78 per cent. No unrelated stock has been introduced during this period of time and no selection has been made for bilateral oviducts. The relatively high incidence observed in the few birds that have been autopsied indicates that the persistency is influenced by genotype. This suggests, for the first time, that persistency of the right oviduct may be controlled genetically in chickens.

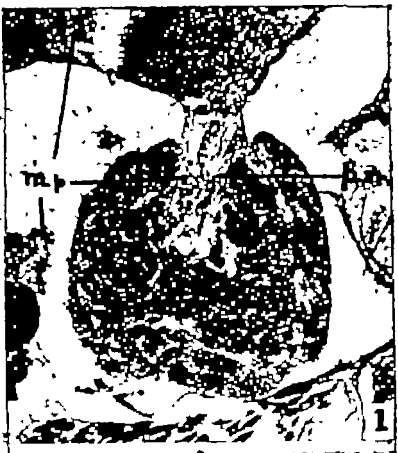
Parasitism in Relation to the Pituitary of *Ophicephalus punctatus* and *Barbus stigma*

The interrelationship between the pituitary and the target organs is, more or less, well known. According to Kerr[1], the occurrence of the plerocercoid stage of a tapeworm (*Ligula intestinalis*) in the body cavity of the roach *Leuciscus rutilus* (Flem.) results in a marked regression of the gonads and in the reduction of the basophils in the middle glandular portion of the pituitary. In the case of the stickleback (*Gasterosteus aculeatus* L.), however, infected with *Schistocephalus solidus*, no difference between



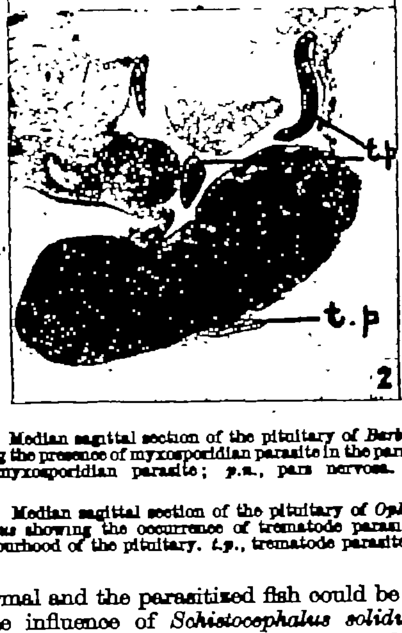


Fig. 1. Median sagittal section of the pituitary of *Barbus stigma* showing the presence of myxosporidian parasite in the pars nervosa. *m.p.*, myxosporidian parasite; *p.n.*, pars nervosa. (× 80)

Fig. 2. Median sagittal section of the pituitary of *Ophicephalus punctatus* showing the occurrence of trematode parasite in the neighbourhood of the pituitary. *t.p.*, trematode parasite. (× 64)

the normal and the parasitized fish could be detected and the influence of *Schistocephalus solidus* on *G. aculeatus* is less manifest. The functional relationship between the pituitary and the gonads in fishes has been determined by the injection of pituitary extracts[2] or by hypophysectomy[3]. Recent studies on the correlation of the cyclical changes in the pituitary and in the gonad of *Cyprinus carpio*[4], *Carassius auratus*[4] and *Rhodeus amarus*[5] also lend support to the existence of the stipulated relationship.

In *Ophicephalus punctatus* (Bloch), I have observed the presence of a trematode parasite in close proximity to the pituitary. These parasites occur in the third ventricle, in the infundibular recess and even on the surface of the pituitary (Fig. 2). The specimen that is being reported upon had regressed testis with residuary sperms in the seminal tubules. The histological structure of the pituitary does not show any abnormality.

Also, the pituitaries of two specimens of *Barbus stigma* (Cuv. Val.) were found to be infested with myxosporidian parasite. In one case, the gonad was mature and ready for spawning. The parasites abounded in the infundibular recess and on the meninges covering the pituitary. In the other case, these parasites were present inside the pars nervosa of the pituitary (Fig. 1) or occurred in the form of cysts on the gonad. Comparison of the pituitary and the gonad of the parasitized specimen with those of the non-parasitized one of approximately the same size and condition did not show any noticeable difference. This suggests that the reported parasitization of *B. stigma* and *O. punctatus* was not such as to impair the function of the basophils of the ubergangsteil.

In the present cases, the parasites occur in close proximity to the pituitary or lie within it, but neither the internal structure of the gonad nor the number of the basophils is affected thereby. The condition found in *O. punctatus* and *B. stigma* is, therefore, milder than that reported of *G. aculeatus* by Kerr[1].

Classification of Wool Follicles in Sheep

A RECENT communication by Lyne[1] notes the presence in some adult merino sheep and one Corriedale ewe of "bundles of primary follicles" having a common neck. Lyne points out that these follicles would normally be classed as secondary follicles in counts to determine the ratio *S*/*P* and that therefore "some of the published observations on the numbers and ratios of follicle types must be re-interpreted".

It is certainly important that care should be exercised in identifying follicles as either primary or secondary during counts made to determine the ratio *S*/*P*; but perhaps as one of the authors of the early classification of follicles in sheep[2], I may be permitted to question the necessity, at present, of re-interpreting published ratios of follicle types. The division of follicles into secondary and primary, although arbitrary, is extremely useful and the basic value to fleece studies of the ratio *S*/*P* rests largely on the assumption that secondary follicles are initiated and differentiated in a growth phase of the coat which is later than that in which primaries are differentiated: the distinction based on this assumption is, in the majority of instances, justified by evidence from coat-development studies. Experience in follicle-population studies has shown that when observing and counting follicles, particularly in adult skin and in merino skin with its high density of follicles, the classification of some follicles is difficult, and in these laboratories such follicles are classed separately as of 'doubtful identity'. Caution, as Lyne implies, is therefore necessary in classifying follicles, and I agree fully with him and with Carter[3] in this.

It would seem then that the significance to *S*/*P* determinations of Lyne's useful and interesting observation cannot be established until there is further evidence to show whether follicles of the type he observed can in fact be justifiably classed as either primary or secondary. These follicles may not even have developed by branching as Lyne assumes; as shown in his figure, they are smaller than the large, obvious primary depicted, have no sweat glands and may have been differentiated much later than the original primaries; if this is so, the fact that these and the original primary lead into a common neck loses its significance in assigning the smaller follicles to one category or another and they may have all the characteristics of secondary follicles. To assess their significance in population studies, further observations on the differentiation of these follicles would be welcome.

Vernal Sloughing of Sludge Deposits in a Sewage Effluent Channel

Vernal sloughs in polluted streams, associated with the break-up of *Sphaerotilus* growths and *Carchesium* colonies, have been recorded by Hawkes[1]. These growths collect silt and humus and, on becoming detached from the stream bed, release large amounts of organic material into suspension.

In April 1954, masses of chironomid tubes were observed floating in the effluent channel of a sewage works using the activated sludge process. The tubes were composed of sludge which had settled on the bed of the channel and the tube-masses were several inches in diameter. This vernal sloughing of the channel bed was associated with the first spring emergence of *Chironomus riparius*, Meigen. The larvæ of this midge were present in densities exceeding 100,000/m.[2] in the winter, spring and early summer of 1954.

Recently, when the effluent temperature was approximately 10° C., sludge was collected containing large numbers of larvæ and placed in a glass tank at approximately 20° C. After a few days the surface layer, the upper zone of which was composed of chironomid tubes, broke away from the deeper layers (Fig. 1), the surface layer being buoyed up by entrapped gas bubbles. Fig. 2 shows conditions after emergence of the midges, the tube layer having separated completely from the rest of the deposit. An analysis was made of the gas evolved by the sludge (Table 1). Its composition is similar to that produced by a group of Thames Estuary muds investigated by Grindley[2], with more than 70 per cent methane.

The large quantity of gas produced at the higher temperatures[2,3] is prevented from escaping by the thick layer of chironomid tubes, and the accumulation of bubbles underneath and within these tubes eventually causes the layer to break off in large masses. High densities of larvæ are necessary for the formation of the tube layer, and its instability, as the upper zone of the deposit, seems to be increased by the emergence of the midges. It is possible that the irrigation currents produced by the larvæ facilitate to some extent the removal of gas bubbles from the tube-layer matrix. The slough is particularly associated with the first spring emergence, when water temperatures are rising and when the tube-layer produced by over-wintering larvæ is especially well developed. This tube-layer incorporates much of the solid matter which settles during the winter period.

Table 1 Analysis of Gas evolved by Sludge

Gas	Volume (per cent)
Carbon dioxide	7·4
Methane	74·7
Oxygen	0·2
Hydrogen sulphide	0
Hydrogen	0
Nitrogen	17·7

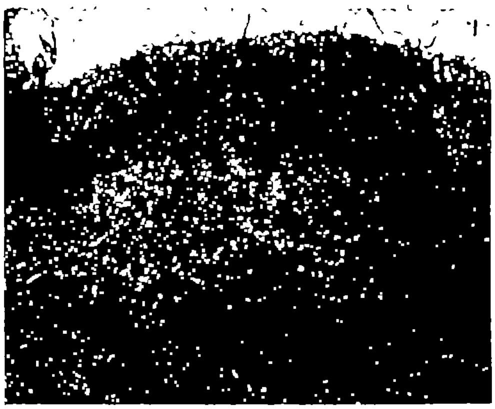

Fig. 1. Break-up of sludge deposits resulting from gas formation

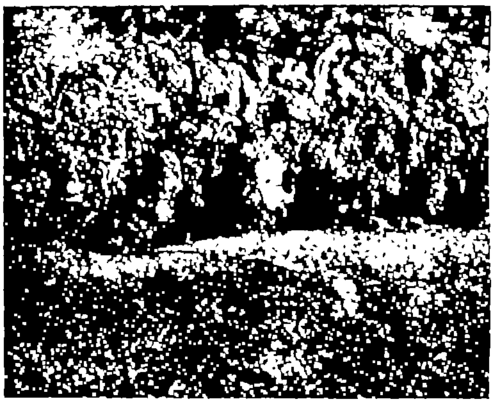

Fig. 2. Separation of the tube-layer after a midge emergence

Thermograph records of the effluent kept from April 1954 until August 1955 indicated that the temperature was rarely higher than 20° C. in the summer or lower than 10° C. in the winter. In April 1954 the effluent temperature varied between 13° and 16° C.

The release of large quantities of organic matter from the benthos is likely to lower the dissolved oxygen concentration in the water and may produce conditions adverse to fish. Furthermore, the superficial resemblance of these tube masses to untreated sewage solids may give rise to complaints from riparian owners.

I should be glad to receive any further observations concerning this vernal sloughing associated with the emergence of midges.

FORTHCOMING EVENT

Thursday, July 18

Linnean Society of London (at Burlington House, Piccadilly, London, W.1), at 11.30 a.m.—Symposium on "Biochemistry and Taxonomy". Speakers include Dr. E. C. Bate-Smith, Dr. C. R. Metcalfe, Dr. J. M. Rowson, Prof. Darnley Gibbs, Dr. P. R. Enslin, Prof. R. Hegnauer, Dr. R. Hill and Dr. J. G. Hawkes.

APPOINTMENTS VACANT

Applications are invited for the following appointments on or before the dates mentioned:

Assistant Biochemist, Basic Grade (with a science degree preferably with honours in biochemistry or chemistry, or the A.R.I.C.)—The House Governor, The General Hospital, Steelhouse Lane, Birmingham 4 (July 20).

Assistant Chemists (with a degree in chemistry or agricultural chemistry or A.R.I.C.), for analytical work on crops and soils (Ref. A); Chemists or Horticulturalists (with a degree in horticulture or chemistry), to take charge of glasshouse work on soils and crop nutrition and to assist with analysis of crops grown (Ref. B); and an Assistant Mycologist (preferably with a degree in botany or agricultural botany), for work on cereal diseases (Ref. C)—The Secretary, Rothamsted Experimental Station, Harpenden, Herts, quoting appropriate Ref. (July 20).

Assistants (2), Grade B, in the Mathematics Department, to teach Mathematics (Pure and Applied) to the level of the higher national certificate and B.Sc. General Degree, Part 1—The Principal, Derby and District College of Technology, Normanton Road, Derby (July 20).

Chief Laboratory Steward (with suitable previous laboratory experience and familiar with the usual laboratory arts)—The Principal, Derby and District College of Technology, Normanton Road, Derby (July 20).

Physicist (Basic Grade), for work initially on problems associated with radium and X-ray therapy and diagnosis and later with radioactive isotopes; and a Physicist (Basic Grade) for work initially on problems associated with radioactive isotopes and later with radium and X-ray therapy and diagnosis—The Secretary, Hammersmith Hospital and Postgraduate Medical School, Du Cane Road, London, W.12 (July 20).

Reader (with high academic and professional qualifications and considerable research experience) in Chemical Engineering—The Registrar, College of Technology, Birmingham 1 (July 20).

Senior Physicist for duties in the Radiotherapy Department—The Secretary, North Middlesex Hospital, London, N.18 (July 22).

Lecturer (with a degree in agricultural science and appropriate postgraduate experience, and preferably lecturing experience) in Agricultural Biology—The Secretary to the Governing Body, Egerton Agricultural College, P.O. Njoro, Kenya (July 27).

Statistician (with an honours degree in mathematics, either including statistics or with a postgraduate diploma in statistics, and preferably experience in applying statistics to biological problems), for the design and analysis of experiments—The Secretary, National Vegetable Research Station, Wellesbourne, Warwick (July 27).

Secretary and Assistant Director (preferably with a university degree in a branch of natural history, or archaeology, or the Diploma of the Museums Association)—The Secretary, The Manx Museum, Douglas, Isle of Man (July 29).

Assistant in Geology—The Secretary of University Court, The University, Glasgow (July 30)

Lecturer or Assistant Lecturer in Zoology at the University of Otago, Dunedin, New Zealand—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (New Zealand, July 31).

Lecturer (with experience in economic geography, cartography, surveying, and the conduct of laboratory and field classes) in Geography at the University of Cape Town, South Africa—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (South Africa, July 31).

Lecturers (2) (with practical experience in the design of electrical plant, automatic control or electronics) in Electrical Engineering—The Registrar, Queen Mary College (University of London), Mile End Road, London, E.1 (July 31).

Reader in Pharmacology in the Department of Human Physiology and Pharmacology, University of Adelaide, Australia—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (Australia, July 31).

Senior Technician in Zoology at University College, Ibadan, Nigeria—The Secretary, Inter-University Council for Higher Education Overseas, 29 Woburn Square, London, W.C.1 (July 31).

Senior Research Workers (2) (with considerable research experience) at the Agricultural Research Council's Poultry Research Centre, Edinburgh, to investigate problems concerning growth and reproduction in the domestic fowl with reference to the importance of endocrine mechanisms—The Secretary, Agricultural Research Council, Cunard Building, 15 Regent Street, London, S.W.1 (August 12).

Assistant in the Department of Zoology in St. Salvator's College—Joint Clerk to the University Court, College Gate, St. Andrews (August 15).

Assistant Professors (2) (preferably with the Ph.D. degree in mathematics) in the Department of Mathematics, University of Western Ontario, Canada—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (Canada, August 15).

Chair of Chemical Pathology in the University of Cape Town—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (South Africa, August 15).

Lecturer in Soil Science; a Lecturer in Chemistry; and a Senior Lecturer or Lecturer in Mathematics at the University of Ghana—The Secretary, Inter-University Council for Higher Education Overseas, 29 Woburn Square, London, W.C.1 (August 20).

Reader in Electrical Engineering at Queen Mary College—The Academic Registrar, University of London, Senate House, London, W.C.1 (August 22).

Reader (highly qualified in the physiological or nutritional aspects of lactation) in Dairy Husbandry at the University of Sydney, Australia, to develop a research and teaching unit on the University Animal Husbandry Farms near Camden, New South Wales—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (Australia, August 24).

Lecturer (preferably with qualifications in one of the following: (*a*) first-year teaching in botany; (*b*) algology, especially marine algology; or (*c*) cytology or cytogenetics) in the Department of Botany, University of Cape Town—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (South Africa, August 31).

Lecturer (preferably with qualifications in the ecology of vertebrates) in Natural History (Animal Ecology)—The Secretary, The University, Aberdeen (August 31).

Professor and Head of the Department of Aircraft Propulsion—The Principal, The College of Aeronautics, Cranfield, Bletchley, Bucks (August 31).

Sessional Instructors in Chemistry—The Chairman, Department of Chemistry, University of Alberta, Edmonton, Alberta, Canada (August 31).

Soil Surveyor (male, with a first- or second-class honours degree (science)) in the Department of Pedology, Soil Survey (Scotland) Section—The Secretary, Macaulay Institute for Soil Research, Craigiebuckler, Aberdeen (August 31).

Chair of Physics in the University of Khartoum—The Secretary, Inter-University Council for Higher Education Overseas, 29 Woburn Square, London, W.C.1 (September 30).

Lecturer in Theoretical Physics—The Registrar (Room 9 O.R.B.), The University, Reading (September 30).

Professor of Applied Mathematics—The Registrar, University Office, 46 North Bailey, Durham (September 30).

Senior Lecturer in Geochemistry in the Department of Mineralogy and Geology, University of Cape Town—The Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1 (South Africa, September 30).

Lecturer (preferably with a medical qualification and qualified to teach for the Honours School of Physiology) in Medicine—The Very Reverend the Dean, Christ Church, Oxford (October 26).

Agronomist (with a university degree in agriculture, and experience in field experimentation, preferably with tropical crops) in the Department of Agriculture, British Guiana, to initiate and carry out crop and fertilizer trials where soil surveys are being carried out to determine optimum land use—The Director of Recruitment, Colonial Office, Great Smith Street, London, S.W.1, quoting BCD. 79/30/01.

Assistant Biochemist in the Department of Pathology—The Secretary, Salford Royal Hospital, Chapel Street, Salford 3, Lancs.

Assistant, Grade B (with a good honours degree) in Mathematics—The Clerk to the Governors, South-East Essex Technical College, Longbridge Road, Dagenham.

Assistant Lecturer in Mathematics—The Secretary, Royal College of Science and Technology, Glasgow.

Assistant or Associate Professor to teach Inorganic Chemistry in French at the undergraduate and graduate levels—The Director of the Chemistry Department, Laval University, Quebec, Que., Canada.

Assistant Warden (with a degree in zoology and an interest in ornithology and freshwater biology) at Flatford Mill Field Centre, East Bergholt, near Colchester, Essex—The Secretary and Treasurer, Field Studies Council, Balfour House, 119–125 Finsbury Pavement, London, E.C.2.

Biochemists (preferably female, with a good honours degree, and at least two years postgraduate experience of biochemical work) at the Medical Research Council's Infantile Malnutrition Research Unit, Mulago Hospital, Kampala, Uganda—The Personnel Officer, Medical Research Council, 38 Old Queen Street, Westminster, London, S.W.1.

Demonstrator (with an honours degree in chemistry or biochemistry and prepared to engage in research in biochemistry with a view to obtaining a higher degree) in the Department of Chemistry and Biochemistry—The Dean, St. Thomas's Hospital Medical School, London, S.E.1.

Medical Laboratory Technologist (A.I.M.L.T., and wide experience of medical laboratory technique, including bacteriology and biochemistry) in the Nigerian Federal Government Medical Department—The Crown Agents, 4 Millbank, London, S.W.1, quoting M.2/43647/NF.

Research Assistant (with H.N.C. or equivalent qualification and capable of constructing experimental apparatus, and preferably some experience in chemical analysis) in the Physical Chemistry Laboratory of the Chemistry Department of the Association in London, to take active part in laboratory research work on the physico-chemical studies of ferrous metallurgical processes—The Personnel Officer, British Iron and Steel Research Association, 11 Park Lane, London, W.1, quoting "C.P.7".

Senior Lecturer (preferably with a higher degree in chemical engineering, and with teaching experience) in Chemical Engineering at University College, Mandalay, Burma—The Ministry of Labour and National Service (E.9), 26–28 King Street, London, S.W.1, quoting A.12/BUR/TCS/217.

Statistician (with a good honours degree in mathematics or statistics) in the Section of Statistics, for biometrical research and consultation—The Secretary, National Institute for Research in Dairying, Shinfield, Reading, quoting Ref. 57/9.

Technical Information Officer (preferably with a degree or similar qualification and experience in engineering or physics (especially electronics), and/or experience of information work, or at least G.C.E. (A) or equivalent) in the Library at the A.E.R.E., Harwell, for duties which include abstracting and indexing technical reports, answering inquiries, literature searching, and the preparation of bibliographies—The Group Recruitment Officer, Atomic Energy Research Establishment, Harwell, Didcot, Berks, quoting Ref. 808/34.

TECHNICIAN (with general laboratory experience)—Nuffield Professor of Surgery, Nuffield Department of Surgery, Radcliffe Infirmary, Oxford.

TRAINING MANAGER (with first-hand experience in training young people), to supervise the training of junior scientific staff in research laboratory techniques in chemistry, physics and metallurgy, and to advise on courses of study at local technical colleges—The Group Recruitment Officer (808/34), Atomic Energy Research Establishment, Harwell, Didcot, Berks.

VETERINARY LABORATORY TECHNOLOGISTS (A.I.M.L.T., or holding a technical qualification in chemistry or biochemistry, and with experience of general pathology and bacteriology techniques) in the Nigerian Federal Government Department of Veterinary Research—The Crown Agents, 4 Millbank, London, S.W.1, quoting M.3/44208/NF.

LECTURES AND COURSES

UNIVERSITY OF BRISTOL

DIPLOMA IN HORTICULTURAL SCIENCE
DIPLOMA IN PLANT PATHOLOGY
(including ENTOMOLOGY) AND
PROTECTION

The above postgraduate diploma courses will be available during the session 1957-58. Conducted in part at the Long Ashton Research Station, they are intended primarily for those with good honours degrees in science who seek careers in horticultural research at home or overseas. The course in Plant Pathology and Protection permits specialization in any approved branch of the subject, including applied entomology.

The Horticultural Science course commences on September 9, the Plant Pathology course on October 1. Both extend over a full session of three terms ending in June or July, and include some additional practical work during the vacations.

Early applications should be made to the Registrar, from whom full particulars may be obtained.

CHELSEA POLYTECHNIC

(COLLEGE OF ADVANCED TECHNOLOGY)
MANRESA ROAD, S.W.3
DEPARTMENT OF BOTANY AND ZOOLOGY

(A) Courses in general and advanced Microbiology will begin on September 27, 1957.

(B) Course of lectures, with practical work on "Metabolism of Micro-organisms" on Mondays 6 to 9 p.m., beginning September 23, 1957.

Tuition fees: (London students), Course A (September to June), 40s. (first year); 40s (second year). Course B (September to Easter), 40s.

Intending students should write to Head of Department of Botany and Zoology, before August 31, 1957. Enrolment. September 18, 6 to 7 30 p.m.

CHELSEA POLYTECHNIC

(COLLEGE OF ADVANCED TECHNOLOGY)
MANRESA ROAD, LONDON, S W 3
DEPARTMENT OF MATHEMATICS

A four-year sandwich course in APPLICABLE MATHEMATICS will begin in January, 1958. The course is recognized for the award of the Diploma in Technology, and State Scholarships, Technical State Scholarships, and Local Education Authority awards may be held by students attending this course.

Inquiries are invited from industrial organizations, schools, and further education establishments which may wish to recommend students for the course.

N. M. H LIGHTFOOT, M.A., F.R.S.E.,
Principal.

CHELSEA POLYTECHNIC

(College of Advanced Technology)
DEPARTMENT OF PHYSICS

Session 1957-58: Postgraduate Evening Courses begin September 23, 1957. Subjects available: Acoustics and Vibration Physics; Nuclear Physics; Optics; Physical Electronics; Quantum Mechanics; Semiconductors; Electro-magnetism. Ancillary Courses include Electronic Circuit Theory. Enrolment: Tuesday, September 17, and Wednesday, September 18, 6-8 p.m.

Further details and application forms from the Secretary, Physics Dept., Chelsea Polytechnic, Manresa Road, S W 3. FLAxman 5747.

BRISTOL EDUCATION COMMITTEE

COLLEGE OF TECHNOLOGY
Principal: G H Moore, M.Sc., F P S, F R.I C
Department of Chemistry and Biology
APPLIED BIOLOGY
FOUR-YEAR SANDWICH COURSE

A four-year sandwich course in Applied Biology will commence on October 28, 1957, and will be open to both college-based and industry-based students. The course is of honours degree standard and is intended to lead to the Diploma in Technology. Entry requirements are either (i) advanced level G C E passes in any two of the following subjects: Chemistry, Botany, Zoology or Biology, or (ii) an endorsed certificate in biology.

Applications for admission to the course should be sent to the Head of the Department of Chemistry and Biology, College of Technology, Ashley Down, Bristol, 7, from whom further information may be obtained.

OFFICIAL APPOINTMENTS

HAMMERSMITH HOSPITAL AND POSTGRADUATE MEDICAL SCHOOL

DU CANE ROAD, LONDON, W.12

Applications invited for the following posts in the Physics Department: (A) Physicist (Basic Grade). The work will be initially on problems associated with radium and X-ray therapy and diagnosis and later with radioactive isotopes. Opportunity for original work and some teaching duties. (B) Physicist (Basic Grade). The work will be initially on problems associated with radioactive isotopes and later with radium and X-ray therapy and diagnosis. Interest in design of electronic apparatus desirable. Opportunity for original work and some teaching duties. Experience desirable, but recent graduates welcomed. Whitley salary scale and conditions.

Detailed applications, names two referees, to Secretary, within fourteen days.

MENTAL HEALTH RESEARCH FUND

Travelling Fellowship for Postgraduate Students in Sciences Basic to Psychiatry. The Mental Health Research Fund awards annually a Travelling Fellowship open to Non-medical Research Students intending to work in a field relevant to Psychiatry. The Travelling Fellowship, which is additional to the fellowship open to Medical Students, is tenable in a Psychiatric or other approved Department abroad for up to six months. Applicants should generally be in the first five years after taking their degree; in support of their applications they should submit published work or a dissertation. The final selection will be made by interview combined with consideration of the candidate's academic record.

Applications should be sent, before March 1, 1958, to the Secretary, Research Committee, Mental Health Research Fund, 39 Queen Anne Street, London, W.1 (WELbeck 1272), from whom further details may be obtained.

UNIVERSITY OF GLASGOW

ASSISTANTSHIP IN GEOLOGY

Applications are invited for an Assistantship in Geology, without restriction of field of interest. The appointment is tenable from October 1, 1957, for one year in the first instance. Salary scale £700 to £850. Initial salary according to experience and qualifications.

Applications (three copies), should be lodged, not later than July 30, 1957, with the undersigned, from whom further particulars may be obtained.

ROBT. T. HUTCHESON,
Secretary of University Court.

NUCLEAR ENGINEER FOR PROFESSORSHIP IN APPLIED SCIENCE

To take charge of a new course for highly selected engineering graduates leading to a Master's degree, to co-ordinate instruction in the several departments, to be responsible for setting up demonstration equipment such as a subcritical assembly, and to teach the principles of nuclear engineering in at least one department. Salary will depend on scientific attainments and experience. Minimum $9,000 a year.

Applications, giving complete details of education and experience and the names and addresses of two referees, should be sent by airmail to

DEAN H. G. CONN,
Queen's University,
Kingston, Ontario, Canada.

UNIVERSITY OF LONDON COMPUTATIONAL UNIT

Application is invited for the following posts on the staff of the Computational Unit which is about to be set up and which will be equipped with a Ferranti Mark II Mercury electronic computer; applicants should have had experience in the use of electronic computers and in numerical analysis: (1) Deputy Director on the scale for Senior Lecturers (£1,450 by £75 to £1,900 plus £80 London allowance); (2) Lecturer (£900 by £50 to £1,350 plus £60 London allowance) or Assistant Lecturer (£700 by £50 to £850 plus £60 London allowance); with family allowances and membership of F.S.S.U. Appointments to date from October 1, 1957, or as soon thereafter as possible.

Applications (four copies), should be sent as soon as possible, to the Secretary to the Senate, University of London, Senate House, W C 1.

EGERTON AGRICULTURAL COLLEGE

P O NJORO, KENYA

Applications are invited for the following post.

LECTURER IN AGRICULTURAL BIOLOGY

Qualifications: Degree in Agricultural Science with appropriate postgraduate experience. Lecturing experience would be an advantage. Terms of appointment. Three-year contract in the first instance with prospects of transferring to pensionable terms. Salary scales: £1,296 by £48 to £1,440, thereafter by £60 to £1,860. Applicants in the United Kingdom would be granted an outfit allowance of £30 on first appointment. Housing available at moderate rental. Gratuity of 13½ per cent of salary payable at end of contract. Leave: Leave (inclusive of overseas and local) is earned at rate of four days per month of service. Passages: Air passages at tourist rates not exceeding four adult fares. Note: Applicants in the United Kingdom for the above appointment must have completed or be exempt from National Service.

Applications, with full details and copies of testimonials, must be submitted to the Secretary to the Governing Body, Egerton Agricultural College, P.O Njoro, Kenya, within three weeks of the appearance of this advertisement.

UNIVERSITY COLLEGE OF SWANSEA

Applications are invited for the post of Assistant Lecturer or Lecturer in Chemistry. Salary: Assistant Lectureship in the range £700 to £850 per annum; initial salary according to age and qualifications. Lectureship, £900 to £1,650 per annum (initial salary will not be more than £1,100). F.S.S.U. benefits and family allowances.

Further particulars may be obtained from the Registrar, University College, Singleton Park, Swansea, to whom applications must be sent by July 19, 1957.

SOIL MICROBIOLOGIST

Applications are invited for the position of Assistant Professor of Soil Science, prefer duties to commence November or December, 1957. Initial salary $5,000 to $6,200 depending on qualifications, plus a summer supplement of $700; normal yearly increment $300. Graduate with soil science specialization and having Ph D degree or equivalent training preferred. Duties include research, teaching and extension work in the field of soil microbiology. Confirmation of appointment subject to satisfactory completion of probationary period of two to four years.

Applications, providing details of training and experience, personal information, a recent photograph and the names of three references, should be addressed to C. F. Bentley, Department of Soil Science, University of Alberta, Edmonton, Canada. Closing date, October 31, 1957.

HUDDERSFIELD HOSPITAL MANAGEMENT COMMITTEE

Applications are invited from holders of an honours degree, preferably in biochemistry or chemistry for the full-time post of Hospital Biochemist to participate in research into biochemical aspects of fungal diseases of the skin. Duties will be undertaken at The Royal Infirmary, Huddersfield, and the Department of Biochemistry, University of Leeds, and opportunities will be afforded to work for higher degree. Salary will be in accordance with Whitley Council Scales.

Applications, stating age, qualifications and experience, and accompanied by copies of two recent testimonials, should be addressed to the undersigned as soon as possible.

H J JOHNSON,
Group Secretary.
Huddersfield Hospital Management Committee,
The Royal Infirmary, Huddersfield.

DERBY AND DISTRICT COLLEGE OF TECHNOLOGY

PHYSICS DEPARTMENT
ADULT LABORATORY STEWARD

Applications are invited for the post of full-time laboratory steward (adult) in the Physics Department. Applicants should have had experience in the organization of laboratories, stores or workshops, and some skill with hand tools and model making would be an advantage. Salary scale: £502 5s rising in four increments to £589 7s 6d. paid weekly.

Forms of application and further particulars of the post are available from the Principal, Derby and District College of Technology, Normanton Road, Derby, by whom completed applications should be received not later than two weeks after the appearance of this advertisement.

COMMONWEALTH of AUSTRALIA

COMMONWEALTH SCIENTIFIC AND INDUSTRIAL RESEARCH ORGANIZATION

WOOL TEXTILE RESEARCH LABORATORIES

APPOINTMENT NO. 462/99 OF RESEARCH CHEMISTS.

Applications are invited for appointment to two vacancies now existing in the C.S.I.R.O. Wool Textile Research Laboratories at Geelong, Victoria. These laboratories are involved in an extensive programme of research with the aim of improving the use of wool as a textile fibre. The Geelong Laboratory is primarily concerned with problems of wool processing, and the appointment of two Research Chemists with ideas and initiative is sought to carry out investigations on chemical problems associated with the wet-processing of wool. Excellent laboratory and pilot-plant research facilities are available. Opportunity exists for independent, or joint research either in the development of new lines of research or in existing investigations. Applicants should possess a university honours degree in science with chemistry or organic chemistry as major subjects, together with some years of postgraduate research experience. Dependent upon qualifications and experience commencing salary will be determined within the salary range of Research Officer, £A.1,313 to £A.1,938 per annum or Senior Research Officer, £A.2,048 to £A.2,323 per annum. The appointments will be conditional upon a satisfactory medical report and in the first instance, be for a fixed term of three years only, but opportunities may arise for appointment to a more permanent position at the end of the term, in which case the appointee would be eligible for Superannuation or Provident Fund benefits. The Organization will provide first-class return sea fares for the appointee and his wife and family

Applications, quoting reference No 462/99, and stating full name, place, date and year of birth, nationality, marital state, particulars of qualifications and experience and of war service, if any, accompanied by copies of not more than four testimonials, and the names and addresses of at least two persons willing to act as referees, if required, should reach the undersigned from whom further particulars may be obtained not later than August 17, 1957.

A. SHAVITSKY,
Chief Scientific Liaison Officer.
Australian Scientific Liaison Office,
Africa House, Kingsway, London, W.C.2.

ST. THOMAS'S HOSPITAL MEDICAL SCHOOL

Applications are invited for the post of Demonstrator in the Department of Chemistry and Biochemistry. Candidates should hold an honours degree in chemistry or biochemistry and should be prepared to engage in research in biochemistry with a view to obtaining a higher degree in this subject. Salary £600 per annum, plus £60 London allowance.

Applications, giving details of qualifications and the names of two referees, should be sent before August 1, 1957, to the Dean, St. Thomas's Hospital Medical School, London, S.E.1, from whom further information may be obtained.

OPERATIONAL RESEARCH SCIENTISTS required by N C.B.'s Field Investigation Group, based in London, to study a wide variety of projects in planning, production, and in human problems. A good honours degree in engineering, physics, mathematics, or statistics is required; the ability to handle data, to think objectively, and to exercise a high degree of imagination and initiative is essential. Appointments (superannuable) within inclusive scales from £690 to £1,468 (male) according to qualifications and experience; there are excellent opportunities for further advancement.—Write, with full particulars of age, education, qualifications and experience, to National Coal Board, Staff Department, Hobart House, London, S W 1, marking envelope X/756/2/B, before July 25, 1957. For further information about these appointments, write informally (or telephone) to the Head of the Group at the above address (Sloane 3401—ext. 202).

ASSISTANT RECORDIST REQUIRED AT Maida Vale Hospital, W 9, in the Department of Applied Physiology. Education to G.C E standard is necessary. Previous experience in electro-encephalographic recording helpful, but not essential as training will be provided for successful applicant. Salary Whitley Council scale: £205 to £325 according to age.—Apply, in writing, to the Secretary, The National Hospitals for Nervous Diseases, Queen Square, W.C 1.

WEST OF SCOTLAND AGRICULTURAL COLLEGE

Applications are invited for the new post of Dairy Chemist in the Dairying Department (at Auchincruive) for investigational work and supervision of routine analyses. Applicants must have an honours degree in chemistry and preferably experience of dairy chemistry. The salary scales (graduate) are Grade IV or Grade III dependent on age, qualifications and experience: Grade III, £770 rising to £1,216; Grade IV(a), £565 rising to £760 (honours degree); Grade IV(b), £545 rising to £760 (ordinary degree) (promotion from Grade IV to Grade III normally follows a few years' satisfactory service).

Conditions of appointment and application forms are obtainable from the Secretary, 6 Blythswood Square, Glasgow, C.2, with whom applications should be lodged not later than August 1, 1957.

GENETICISTS, BACTERIOLOGISTS, PHYSICAL CHEMISTS

required by

A.E.R E., HARWELL

for its programme of Research into the Industrial Application of Ionizing Radiations.

Applications are invited from Graduates and Postgraduate research workers in the above fields for Scientific Officer posts, to study effects of ionizing radiations on fruit and plants, and catalysts; and from other experienced workers in these fields with at least G C.E. (A), or equivalent for posts of Experimental Officer and Senior Experimental Officer.

Vacancies also for Assistants (Scientific) in fields of entomology, biochemistry and botany, for which G.C E. (O); O.N.C.; or equivalent, is required. Training concessions for improvement of qualifications available to suitable candidates.

Salaries: Scientific Officer, £610 to £1,065; Senior Scientific Officer: £1,155 to £1,355; Experimental Officer, £940 to £1,155 (minimum age normally 26); Senior Experimental Officer, £1,295 to £1,550; Assistants (Scientific), £305 (at 16) to £640.

Send postcard (stating preference for field of work and grade), by July 22, to Group Recruitment Officer (834 Z/34), A.E.R.E., Harwell, Didcot, Berks, for further details and an application form.

IMPERIAL COLLEGE OF SCIENCE AND TECHNOLOGY

Lecturer required for the Department of Chemical Engineering. Applicants should have a taste for personal tuition of students and the initiation and direction of postgraduate research. A first-class honours degree in chemical or mechanical engineering or physics is desirable. Industrial experience would be of value, but a thorough grounding in engineering science or applied physics is essential. Salary scale £900 by £50 to £1,350; by £75 to £1,650, plus £60 London allowance. Family allowances and F.S S U.

Applications to Professor P. V. Danckwerts, Chemical Engineering Department, Imperial College, London, S.W.7.

D.S I.R. REQUIRES EXPERIMENTAL Officers and Assistant Experimental Officers at the Hydraulics Research Station, Wallingford, Berks, for the following posts: (1) Civil Engineer or Geographer (ref. E 430/7A), for coast erosion studies at the Hydraulics Research Station or in the field; (2) Civil Engineer or Physicist (ref E 431/7A), for Sedimentation Laboratory; (3) Engineer, Geographer, or Surveyor (ref. E.432/7A), for Survey Team; (4) Civil Engineer or Physicist (ref. E 433/7A), for hydraulic research, on models. Qualifications: G C.E. advanced level in two scientific or mathematics subjects or equivalent; over age 22, H N C. or pass degree generally expected. Salary at Wallingford for a five-day 44-hour week: Assistant Experimental Officers (men), £350 (at 18) to £615 (at 26) to £755. Experimental Officers (men), £875 to £1,075 Women's scales being improved under equal pay scheme. Favourable housing prospects for married staff.—Forms from Ministry of Labour and National Service, Technical and Scientific Register (K), 26 King Street, London, S.W 1, quoting appropriate reference

---

GOVERNMENT OF BRITISH GUIANA

GEOLOGISTS

Qualifications: First- or upper division second-class honours degree in geology. Age limits: Preferably not over 35. Duties: General geological mapping and mineral investigations in the interior of British Guiana. Work will be chiefly on pre-Cambrian crystalline rocks with emphasis on petrographical structural and economic studies. Terms of appointment: On appointment and pensionable terms or three year contract with gratuity at the rate of 22½ per cent of salary. Commencing salary £830 in the scale £770 by £30 to £950 by £50 to £1,400 per annum with additional increments for approved experience and additional postgraduate qualifications. £50 outfit allowance. Subsistence and travelling allowance paid when in field away from Headquarters. Camping equipment supplied. Furnished quarters provided at District Headquarters rental 12 per cent salary subject to maximum of £150 per annum. Furnished quarters sometimes available at rental in Georgetown. Free passages officer and family up to five persons in all on appointment and termination of contract. Assisted leave passages for officer appointed on pensionable terms Five days vacation leave for each month resident service after tour of three years. Fourteen days local leave per annum. Taxation at local rates

Apply to Director of Recruitment, Colonial Office, London, S W 1. State age, qualifications and experience. Quote BCD.105730/02.

LONDON SCHOOL OF HYGIENE AND TROPICAL MEDICINE

Keppel Street (Gower Street), London, W C.1

Applications invited for Junior Lectureship in Entomology for two years in first instance, with possibility of extension. Salary £850 by £50 to £1,050 a year, plus £60 London allowance and family allowances.

Applications, stating age, qualifications (with dates) and previous experience, should be sent to the Dean as soon as possible.

UNIVERSITY COLLEGE, DUBLIN

The Professorship of Farm Management.
The Professorship of Agricultural Chemistry
The Professorship of Chemical Engineering
The Professorship of Celtic Archaeology.

Applications are invited by the Governing Body of University College, Dublin, for the above statutory offices.

Applicants must forward to the Secretary and Bursar, University College, Dublin, 150 copies of their applications and testimonials, to be received by him not later than September 15, 1957.

Further particulars may be obtained from:

J. P MacHale,
Secretary and Bursar,
University College,
Dublin

CENTRAL WIRRAL GROUP

CLATTERBRIDGE HOSPITAL, BEBINGTON, CHESHIRE

RADIOTHERAPEUTIC WING

Applications are invited for a Senior Technician to carry out the routine care and maintenance of a 4 MeV. linear accelerator, and to assist with the construction of experimental equipment for this machine. Some knowledge of electronics is essential, and previous experience with pulsed radar techniques would be valuable. Salary. £600 to £775 per annum.

Apply, on forms obtainable from the Secretary, not later than July 20, 1957.

UNIVERSITY OF SASKATCHEWAN

CANADA

DEPARTMENT OF PHYSICS

POST-DOCTORAL RESEARCH FELLOWSHIP

Applications are invited for a Post-doctoral Research Fellowship in upper atmospheric physics The research to be undertaken involves the investigations of the spectrum of the aurora and airglow in the PbS region.

Further information may be obtained by writing by airmail to Dr. A. Vallance Jones, Department of Physics, University of Saskatchewan, Saskatoon, Saskatchewan, Canada.

ANIMAL ATTENDANT FOR SMALL ANImals required. Wages £9 per week, plus house. Family allowance for each dependent child, superannuation scheme. Previous experience and good references essential.—Apply, stating age, experience, and enclosing copies of references, to the Secretary, Royal Veterinary College, Royal College Street, London, N W.1.

MIDDLESEX COUNTY COUNCIL EDUCATION COMMITTEE

BRUNEL COLLEGE OF TECHNOLOGY
WOODLANDS AVENUE, ACTON HILL, W 3
OPENING IN SEPTEMBER, 1957

Applications are invited for the following:

SENIOR LECTURER in ELECTRONICS The person appointed will be responsible for all the work in Electronics in the College including full-time, sandwich and part-time courses as well as postgraduate courses and research. The post is one of special responsibility for the work of the Electronics Division of the College and carries a salary £150 higher than the maximum of the Senior Lecturers' scale.

There is an opportunity to develop courses in electronics, particularly for physicists and engineers, to the highest standards. Candidates should be well qualified in electronics and have appropriate industrial, research and teaching experience. Ability to direct research in some branch of electronics will be an added qualification.

SENIOR LECTURER in METALLURGY The person appointed will be responsible under the Head of the Department of Chemistry, for all the work in metallurgy including full-time, sandwich and part-time courses leading to professional qualifications, postgraduate courses and research.

There is an opportunity to develop technological courses in metallurgy to the highest standards Candidates should be well qualified in metallurgy and have appropriate industrial, research and teaching experience. Ability to direct research in metallurgical problems will be an added qualification

LECTURER in METALLURGY. The person appointed will be required to teach metallurgy to the standard of the Diploma in Technology and the A.I.M. He will be encouraged and afforded opportunity to do research. Special knowledge of Heat Treatment, or Corrosion or Metallography of Alloy Steels would be a recommendation.

Candidates should have a good degree or equivalent qualification in metallurgy and have appropriate industrial and/or teaching experience

ASSISTANT, GRADE "B," in CHEMISTRY to teach mainly inorganic and some physical chemistry up to general degree standard.

ASSISTANT, GRADE "B," in BIOLOGY to teach zoology up to general degree standard and to share in the advanced work in physiology.

ASSISTANT, GRADE "B," in METALLURGY to teach metallurgy in Ordinary National Certificate courses in metallurgy and to engineering students in mechanical and production engineering courses

ASSISTANT, GRADE "B," in MATHEMATICS to teach the subject to degree and diploma in Technology standard.

LECTURER in PHYSICS to teach the subject to degree and Diploma in Technology standard Special qualifications in some branch of applied physics desirable.

Candidates should hold a good degree in their special subject and have had appropriate industrial and/or teaching experience. Opportunities to undertake research afforded to suitably qualified staff.

Salary in accordance with the Burnham (Technical) Report, 1956, i e, Senior Lecturer, £1,350 by £50 to £1,550 per annum plus London allowance, Lecturer, £1,200 by £50 to £1,350 per annum plus London allowance; Assistant, Grade "B," £650 by £25 to £1,025 per annum plus London allowance—commencing salary dependent upon teaching and/or industrial experience

Further particulars and forms of application (stamped addressed foolscap envelope), from the Clerk to the Governing Body, Brunel College of Technology, to whom completed forms must be returned within fourteen days of the appearance of this advertisement.

C. E GURR, M Sc, Ph.D.,
Secretary to the Education Committee

DSIR REQUIRES ASSISTANT EXPERIMENTAL Officers at Road Research Laboratory, Harmondsworth, Middx. Varied and interesting work for Chemists, Physicists, Mathematicians, Civil and Mechanical Engineers on materials, methods of construction, traffic and safety. Salary in range £357 (age 18) to £780 Women's pay slightly less but subject to improvement under equal pay scheme Prospects of promotion to Experimental and Senior Experimental Officer (rising to £1,457) Qualifications: G C E. "A" level in two scientific or mathematics subjects Over age 22, pass degree, H N.C. or equivalent generally expected Five-day week —Forms from Ministry of Labour and National Service, Technical and Scientific Register (K), 26 King Street, London, S W 1, quoting A 195/7A

UNIVERSITY OF CAPE TOWN

Applications are invited for a Senior Lectureship in Geochemistry in the Department of Mineralogy and Geology. The commencing salary (within the scale £1,200 by £50 to £1,500 per annum) will be determined according to the qualifications and experience of the successful candidate. The appointment will be made on a temporary basis for a period of five years, during which the establishment of a permanent post will be considered. There is also a temporary cost, of living allowance for a married man (at present £234 per annum)

Applications should state age, qualifications and experience, and research work completed or in progress, and give the names of at least two referees whom the University may consult. Two copies of the application should reach the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C 1 (from whom a memorandum giving the general conditions of appointment and information on the work of the Department should be obtained) not later than September 30, 1957. An additional copy should be sent direct by airmail to reach the Registrar, University of Cape Town, Private Bag, Rondebosch, Cape Town, South Africa, by the same date. The University reserves the right to appoint a person other than one of the applicants or to make no appointment.

CHEMIST OR BIOCHEMIST

required by

ATOMIC ENERGY RESEARCH
ESTABLISHMENT, HARWELL

to study the uptake and metabolism of radioisotopes by plants, by field and laboratory work.

Applications from honours graduates and postgraduates interested in the above are invited for appointment as Senior Scientific Officer or Scientific Officer according to age, qualifications and experience.

Salary: £1,155 to £1,355 or £610 to £1,065

Send postcard by July 23 to Group Recruitment Officer (823/34), A E.R.E., Harwell, Didcot, Berks., for further details and an application form.

BRITISH GUIANA

DEPARTMENT OF AGRICULTURE
AGRONOMIST

To initiate and carry out crop and fertilizer trials where soil surveys are being carried out to determine optimum land use. Qualifications: A university degree in agriculture, and experience in field experimentation, preferably with tropical crops. Terms of appointment. Appointment on contract for period of two years. Emoluments Salary scale £770 to £1,400 a year, point of entry depending on qualifications and experience. Gratuity at the rate of £22½ per cent of basic salary Furnished quarters available for rental Leave of five days for each completed month of service.

Apply, giving brief particulars, to the Director of Recruitment, Colonial Office, Great Smith Street, London, S.W.1, quoting reference BCD 79/30/01.

RE-ADVERTISEMENT

HUDDERSFIELD TECHNICAL COLLEGE

Principal: Dr. W. E. Scott, M.B E

Applications are invited for the Headship of the Department of Mathematics, vacant on September 1, 1957. Applicants should possess high academic qualifications in mathematics with teaching and research or industrial experience Salary. Burnham Scale, Grade 11, £1,400 by £50 to £1,600 per annum,

Application forms and further particulars obtainable from the Principal, Technical College, Queen Street South, Huddersfield, to whom applications should be returned as soon as possible

---

ROYAL NORTHERN HOSPITAL

HOLLOWAY ROAD, LONDON, N.7

Chief Physics Technician required in Radiotherapy Department in temporary capacity to assist in research on moving beam radiotherapy Some of the work will be evenings and week-ends in order to obtain sufficient access to apparatus Salary: £900 per annum. Senior Technician also required to assist with above. Good workshop experience essential Salary: £750 per annum

Application forms obtainable from Hospital Secretary.

SOUTHPORT AND DISTRICT HOSPITAL MANAGEMENT COMMITTEE

BIOCHEMIST (MALE OR FEMALE)

Persons holding an appropriate science degree or the A.R.I.C. or other approved qualification are invited to apply for the post of Biochemist in the Group's Pathology Department at the Southport General Infirmary. Salary £475 to £845 per annum in accordance with Whitley Council recommendations. Postgraduate experience is not necessary but candidates with such experience will commence at an appropriate point within the scale. The successful candidate will be responsible for the biochemical work of the Group under the general direction of the Pathologist

Applications, stating age, qualifications, with dates, nationality, past and present appointments, with the names of two referees, should be sent to the Group Secretary, Southport and District H M.C., Promenade Hospital, Southport, within 21 days of this notice.

UNIVERSITY OF DURHAM

Applications are invited for the newly created post of Professor of Applied Mathematics in the Durham Division of the University. Salary within the approved professorial scale with normal starting point at £2,300 a year with family allowances and F S.S.U.

Further particulars may be obtained from the undersigned with whom twelve copies of application, giving the names of three referees, should be lodged not later than Monday, September 30, 1957. Candidates outside the British Isles may submit one copy only.

E. M. BETTENSON,
Registrar.

University Office,
46 North Bailey, Durham.

UNIVERSITY COLLEGE OF NORTH STAFFORDSHIRE

Applications are invited for the following posts in the Department of Geology: Research Assistant to work under the supervision of Professor F W Cope on a detailed study of the upper Coal Measures of North Staffordshire. Candidates should have a good honours degree and some postgraduate experience in sedimentary petrology, or palaeobotany, or stratigraphical work Remuneration: £800 per annum with F S.S.U. and children's allowances. Demonstrators and/or Tutorial Students. Three posts. Applicants who have graduated with good honours degrees this year will be considered. Remuneration: Demonstrators, £550 per annum; Tutorial Students, £500 per annum.

Applications should reach the Registrar, The College, Keele, Staffs, from whom further particulars and application forms may be obtained, not later than July 31, 1957.

UNIVERSITY OF BIRMINGHAM

DEPARTMENT OF MECHANICAL ENGINEERING

Applications are invited for the post of Lecturer in Mechanical Engineering. Candidates should have an honours degree in engineering, an interest in research and some experience in the fields of nuclear engineering and/or of the compression ignition engine. Salary within the range of £900 to £1,650 according to qualifications.

Applications (two copies), should be sent before August 31, 1957, to the Registrar, The University, Edgbaston, Birmingham, 15, from whom further particulars can be obtained

---

AGRICULTURAL ENGINEERING—LECturer in Agricultural Engineering, Hawkesbury Agricultural College, N S.W. Department of Agriculture, Australia. Applications are invited for the above position. Salary £A.1,329 range to £A.1,489 per annum. Further progression to £A 1,810 per annum assured, subject to conditions. Accommodation available for single person. Duties: Lecturing and demonstrating to students, supervising maintenance of plant and machinery, and assisting the Senior Lecturer in investigational and research work Qualifications: University degree or Diploma in Mechanical or Civil Engineering, or equivalent Experience in agricultural engineering, automotive or agricultural machinery and in lecturing or teaching an advantage Fare to Sydney of appointee and family will be paid Subject to medical fitness, appointee will be eligible to contribute to the State Superannuation Fund.—Four copies of applications (including the names of two referees), should be lodged with the Agent-General for New South Wales, 56 Strand, London, W C 2, by July 25, 1957.

NEW POLISHING & MOUNTING TECHNIQUES

for metallurgists, made possible by Nash and Thompson's Metallurgical Mounting Press and Electrolytic Polisher

Nash and Thompson's Metallurgical Mounting Press and the NEW N. and T. Electrolytic Polisher together provide a highly flexible approach to the problems of laboratory quick mounting and polishing of specimens for metallographic work. The Electrolytic Polisher can also be used for laboratory investigations into plating and anodising techniques. Keynotes of both instruments are simplicity and adaptability. Further details are available on request.

SCIENCE BUILDINGS FOR SCHOOLS

THE first full account of the work of the Industrial Fund for the Advancement of Scientific Education in Schools* appears when the Fund has virtually completed the active stage of its work. Almost all the schools to be visited have been seen and considered, and practically the whole of the £3,159,669 subscribed by 141 industrial firms has been committed. Building grants totalling £2,461,250, as well as £250,950 for apparatus, have been given or promised to 187 schools; and a further £110,300 for apparatus to another 143 schools. No grants have been made to voluntary aided schools, and the schools to which grants were made include 82 girls' schools. For these exactly the same criteria were applied, but with some exceptions girls' schools on the whole are as yet far behind the level of boys' schools.

The report of the Executive Committee of the Fund makes available a considerable amount of information relating to an aspect of education in Britain which has probably not previously been so closely surveyed, and this material and the conclusions reached are of especial interest at the moment for two reasons: first, on account of the renewed attention which the position of the voluntary schools, and particularly of the public schools, in the educational system of Britain has attracted; second, while there has been some discussion as to the extent to which the grammar schools are contributing to the supply of technologists, the report of Dr. Willis Jackson's Committee has emphasized the direct connexion between the supply of teachers for technical colleges and colleges of technology and the supply of science teachers in the schools. Evidence submitted to the latter committee indicated that of new staff entering the technical colleges in recent years, more than a quarter were teachers transferring from full-time service in schools, and a considerable proportion of these were graduates in mathematics and science.

Thus, while on one hand the work of the Industrial Fund should help to increase the supply of those entering on courses in science and technology at the universities and technical colleges, and ultimately the number of teachers in technical colleges as well as of teachers of science and mathematics in the schools, in the short run, by making science teaching in the schools more attractive, it could check a source of supply which is at present very welcome to the technical colleges. This, however, is not a source of supply on which the Willis Jackson Committee is disposed to rely. Apart from the desirability of teaching experience on the part of teaching staff in the technical colleges, it involves a severe loss to the schools at a time when they themselves are facing an alarming shortage of teachers of mathematics and science.

The Executive Committee of the Industrial Fund expresses the opinion in its report that, in the so-called 'independent' and 'direct grant' schools generally, as distinct from 'maintained' schools, the shortage of science teachers has been as yet a less critical problem than the lack of money for capital projects, though the comment is made that it is exceedingly difficult to find science teaching staff for the girls' schools. Moreover, the opportunities for women scientists in industry are not yet as clear as they should be, and the Executive Committee considers that industry as a whole must give more and urgent attention to this problem in future.

This problem apart, the report shows that there is a very strong wave of interest in science in the schools, which is still mounting, and the effect of which continues to spread. The Fund's activities have done much to accentuate this wave; but the tendency was marked well before the Fund was created. The Committee believes that the establishment of the Fund has set every school thinking, or thinking more intensely, on the national demand for scientists and technologists, and the means within its power to assist in meeting that demand. It believes that this effect has spread far outside the schools with which it has dealt, and that during the next few years many of the smaller schools could make a valuable contribution to Britain's scientific strength provided they get the assistance they merit and need.

In actual results the Executive Committee concludes that the requirements of the next five to ten years will be secured in the schools that have been assisted, and that the total teaching spaces for physics and chemistry and the area of teaching space per pupil more than thirteen years of age will both have been increased by about 50 per cent. Moreover, the improvement in facilities must have a marked effect on the general quality of output, and the money now committed will provide for an increase of 3,500–4,000 in boys and girls taking physics and chemistry at sixth-form level. In addition, while the Committee is satisfied as to the practicability of a mathematics and science sixth representing 60 per cent of the sixth, it also notes that in nearly all the independent and direct grant schools all boys are to-day taught science at some stage in their education.

These are encouraging observations which indicate that these schools are capable both of offering a real contribution to the nation's requirements for scientists and technologists and of furthering the general understanding of science and the scientific approach, which is no less needed. Here alone is sufficient ground for giving pause to attacks on the independent schools in the name of party political doctrine and in disregard of their contribution to Britain's strength. The Executive Committee of the Fund, moreover, in sizing up its problem, worked through qualified and experienced assessors who visited some 229 schools out of the 445 which completed the Committee's questionnaire, and much of the interest of the report lies in the considered views of these assessors which are set forth in an appendix.

---

* Report on the Industrial Fund for the Advancement of Scientific Education in Schools. Pp. ii+35. (London: Industrial Fund for the Advancement of Scientific Education in Schools, 1957.)

Analysing the replies received, the assessors note that large schools produce a higher proportion of boys in the mathematics and science sixth forms, and that the most frequently mentioned obstacle to increasing the quantity and improving the quality of science teaching was lack of separate accommodation for the sixth form. This obstacle was reflected in the headmaster's decision to limit the numbers to match the capacity of the school laboratories; in the consequent tendency of parents and boys to decide that the boy should leave after studying physics and chemistry to the Ordinary level of the General Certificate of Education, or that in the sixth form the boy should pursue a course of studies for which the school is better equipped; and in greater difficulty in recruiting science staff. The assessors believe that by helping to increase the sixth form output, the Fund, although in operation concerned solely with buildings and apparatus, will produce more graduates from which the teaching profession can be recruited, and by improving the conditions for work will make science teaching attractive to more graduates. Furthermore, the provision of good preparation rooms and workshops is the first step to securing the skilled laboratory assistants which many schools need.

The assessors estimate that there may be in all the secondary schools in England and Wales some 30,000–35,000 boys and girls in the mathematics and science sixth forms, of whom some 20,000 are in the maintained schools. They suggest that while larger numbers taking science will increase the size of the pool from which scientists, technologists and science teachers may be recruited, the introduction to science of more girls and boys in the lower part of the school will provide some of the increase from the abler individuals who might otherwise have elected to follow a different course of study. Again, restriction of entry to the mathematics and science sixths to those who may, with fair confidence, be expected to have highly successful university careers, results in exclusion of boys and girls who, under the stimulus of lively teaching in good conditions, may well develop latent potentialities and become valuable recruits to industry whether or not they go on to universities.

Apart from the promising results already achieved, the report indicates that the Fund is being operated on lines very similar to those which Dr. Willis Jackson and his colleagues recommend for dealing with the supply of teachers for technical colleges. The hope of progress lies not so much in new or revolutionary measures as in the steady improvement of working conditions, so that they satisfy the legitimate needs of men and women of first-rate ability and high ideals. The report suggests that the contribution of the independent schools to the nation's needs for scientists and technologists is very far from being as negligible as it is sometimes represented to be, and that it would be only common prudence not merely to refrain from disturbing or interrupting that contribution, but rather to seek to augment by suitable measures the work which the Industrial Fund is doing to increase that contribution. Lastly, the success of the Executive Committee of the Fund in creating a mutual understanding and identity of interest between industry and the schools augurs well for response to the emphatic appeal of the Willis Jackson Report for co-operation between industry and the technical colleges. The very success of the Fund's work is, as the assessors rightly observe, a challenge to science teachers. It is no less a challenge to the nation generally. If already many of the ablest boys in the schools who were formerly channelled into the humanities are now indeed turning to science, it must not be left solely to the science masters to see that their ministrations do not produce narrow specialists but help those with whom they are in contact to make of science the core of a balanced education. They will require the support and encouragement of a public opinion, fully aware of what is required and alert to check any doctrinaire attempt to frustrate or hinder this invaluable contribution to one of the country's most pressing needs.

SCIENCE AND VALUES

Modern Science and Human Values

A Study in the History of Ideas. By Prof. Everett W. Hall. Pp. x+483. (Princeton, N.J.: D. Van Nostrand Company, Inc.; London: Macmillan and Co., Ltd., 1956.) 45*s*. net.

WE have had many books of late dealing with the relations of science and values in the age of the hydrogen bomb. The question of whether man's moral stature is capable of controlling the consequences of his intellectual achievements is becoming ever more acute. The answers given to it are for the most part didactic and unsatisfying. Here, in Prof. Hall's "Modern Science and Human Values", we have a somewhat different approach, based on the history of ideas, presented in a logical and philosophical framework. The general theme is that of the break-up of the unified Medieval picture of the universe in which fact and value are both determined by an omnipotent God as set out in His revelation. The emergence of natural science in the Renaissance opened the possibility of determining *facts* by experiment and calculation, but left *values* without solid support. It was some realization of this danger that urged the churches' resistance to the new knowledge, culminating in the trial of Galileo; but with their virtual failure the possibility of continuing to use divine ordinance to determine value also failed. For a while it seemed that the new science might succeed in the field of values also, and much of this book is taken up with the history of the rise and fall of a scientific ethic based on Galilean or Newtonian physics.

The work falls symmetrically into two parts, one on the history of science, and the other on values, and the progress of each is followed through five stages—Medieval, Renaissance, the Age of Reason (mainly during the eighteenth century), the Age of Romanticism (covering the nineteenth century), and the present age. There is a good deal of overlapping, so that Rousseau goes with Romanticism and Bentham with the Age of Reason, which makes the story at times somewhat difficult to follow. There is also a curious eclecticism. Aristotle is fully treated but Plato is not mentioned, though there is much about the Cambridge platonists. Hobbes is treated as a central figure but Descartes never appears nor does Spinoza. Franklin and Priestley do not get any hearing amid a host of obscure eighteenth-century moralists. These absences show that Prof. Hall is concerned less with writing a comprehensive history than with illustrating an argument.

It is evident throughout that, as a good professor of philosophy, his concern is chiefly in the evolution of ideas about values, but the first section holds some interest for students of the history of science. Here there is no claim to uncover new material but rather, by a different arrangement of well-known facts, to bring out connexions hitherto missed. Particularly useful is his running together of economic theory with natural science. Aristotle's economics, with its disparagement of interest, was as much rejected in the Renaissance as his theory of motion. The central argument is that the attack on the theory of motion towards an end—the *telos* or accomplishment of purpose—denaturalized both science and ethics. The common-sense world disappeared and an abstract mechanical–mathematical causality took its place. One interesting suggestion put forward, that I have not seen elsewhere, is that Newton's definition of quantity of matter, "as arising from its density and its bulk conjointly", is not so much a circular argument as an attempt to assess the invariant in Boyle's experiments on the compression of gases, and is thus the forerunner of conservation theories. The account of present-day science stops with Einstein's theories, which are made to serve somewhat incongruously as an introduction to marginal economics.

The second section, on human values, is more for historians of philosophy and ethics. Hobbes's denial, in his "Leviathan", of all objective value save as vested by common surrender into the hands of an arbitrary state is shown as the starting point of the attempt to make an ethic without God. Here Prof. Hall draws the distinction between voluntarist ethics —'good' is what I, or the Bible, or the king, say is good—and naturalist ethics, which is independent of any human command. The great advance of modern times, he claims, is the discovery that statements of fact and of value are of different kinds. As we read on we hope to find out what values really are, but we are doomed to disappointment. Prof. Hall's history ends with the logical positivists who claim that statements about value are meaningless because unverifiable. He does not himself believe this, but what he believes is not history but philosophy, so that the answer will be in another book.

J. D. BERNAL

THE CIVIL SERVICE IN GREAT BRITAIN

Civil Service or Bureaucracy?

By Dr. E. N. Gladden. Pp. 224. (London: Staples Press, Ltd., 1956.) 21s. net.

IN this, his third book on the Civil Service, Dr. Gladden gives a concise review of the structure of the Civil Service to-day, its evolution, conditions of service, methods of selection, training and promotion, the methods of control and of joint consultation and other factors which determine its morale, before continuing the discussion of the problem of adapting the Service to the changing needs of to-day on which he embarked a dozen years ago in "The Civil Service: its Problems and Future". Their discussion occupies the five chapters which comprise the second part of the book; but the first part, while adding little to the contribution of various other volumes on this theme during the past ten years, contains some shrewd criticism and makes several sound comments. Moreover, Dr. Gladden's book includes an annotated select bibliography, covering the more important Parliamentary papers, and also an index.

For that reason alone, Dr. Gladden's book is likely to be more useful than most other recent books on the subject in supplementing the report of the Priestley Commission for those seeking to gain some understanding of the function of the British Civil Service to-day and its relation to the national welfare. To provoke such public understanding is one of Dr. Gladden's main purposes in writing this book. He reiterates again and again the need for such understanding and for a change in the public mind towards the Service. Protesting firmly against ill-informed criticism of the Civil Service, he points out that, in misrepresenting public administration to the people, the Press is obstructing the advance in effectiveness of popular government. Whatever improvements may be possible either in the Civil Service itself, or in the organization of Government, their effectiveness depends on an enlightened citizenship, well informed on political questions and capable of discussing practical problems without excessive emphasis upon emotional and sentimental factors.

That condition has not yet been served, nor will it be easily or cheaply secured. Whether Dr. Gladden will be more successful than previous writers in reaching those quarters where it is most essential for public understanding to be increased is perhaps doubtful, but his book is a very readable effort to that end and it gives clear warning of the dangers that attend neglect. As he rightly concludes, a Civil Service adequate to present needs will emerge only on the wings of a more liberal understanding.

Dr. Gladden's other main purpose is with the administrative aspect of the Civil Service, which he examines critically, and he offers again, but rather more diffidently, his suggestion of a personnel organization board to watch over the staffing patterns of the various departments and to control the flow of transfers according to needs so as to encourage a general level of opportunity throughout the Service. The idea behind the suggestion is to encourage and reward genuine initiative by raising the level of staff management and efficiency. Since Dr. Gladden first made this suggestion in 1945, the system of promotion pools has greatly facilitated this type of adjustment, but while there may still be opportunity for an impartial board such as he suggests, the greater need is to encourage and strengthen the professional outlook in the Civil Service. Some of Dr. Gladden's views, in the chapter in which he advocates formation of a professional council for the Civil Service, are open to challenge—government scientists will scarcely allow to pass without comment the remark that their function is research, not administration—but he rightly argues for official recognition that the study of public administration is a desirable activity on the part of any Civil servant, and that the outstanding lesson of the Crichel Down incident is the threat offered to public freedom by the inefficient self-centred official rather than any deficiency revealed in the constitutional system.

More important, however, than Dr. Gladden's particular proposals for reform is the way in which, firmly and clearly, he points to weaknesses in the existing system—to lack of vision, to short-sighted economies, whether dictated by internal tradition or misguided external pressure and criticism. On the principles of promotion he writes with sense, shattering the notion that we are compelled to choose between seniority and merit, for example. He sees clearly the danger of bureaucracy, but above all his book indicates the great contribution to the public welfare which could be made by a Civil Service staffed and trained to meet the new demands, given the support of a public opinion, critical, alert and informed and alive to the central fact, to which the last report of the Civil Service Commissioners testifies, that public respect and adequate remuneration even more than past traditions are the essential factors if we are to recruit for the Civil Service in Britain men and women of the high ability and integrity its work demands.

R. BRIGHTMAN

ENGLISH PLACE-NAMES

English Place-Name Elements

By A. H. Smith. Part 1: Introduction, Bibliography, The Elements A–IW, Maps. Pp. lvi+306. Part 2: The Elements Jafn–Ytri, Index and Maps. (English Place-Name Society, Vols. 25 and 26.) (Cambridge: At the University Press, 1956.) 35*s*. net each volume.

THE English Place-Name Society was founded in 1922, and two years later there appeared a slim volume of some 70 pages written by Sir Allen Mawer and called "The Chief Elements used in English Place-Names". It was intended, as its preface said, to provide a companion to the county volumes that were yet to appear, and it has proved an invaluable guide. Since that time, the Society has published twenty-four volumes dealing with nineteen counties, and other volumes are in active preparation. In view of the vast amount of material already assembled, the time seemed appropriate for "a new and more extensive study", and the present two volumes are the result.

They present a very striking testimony to the achievement of the Society over the past thirty years or so. Such work as this can be accomplished only as the result of the most patient and meticulous scholarship guided by acute and critical judgment. Primarily, the elucidation of place-names makes a contribution to the study of language, but this is only a part of its interest. The evidence of place-names constitutes a major source for the history of early Britain, that is, for a period for which other sources are slender in amount and difficult to interpret; and the ramifications of this interest concern the archæologist and the historical geographer. These present volumes combine the expertize of the philologists with an appreciation of the problems that confront the student of early society and early landscape in Britain.

The entries are arranged in the form of a dictionary, and the space devoted to each varies from a single line to many pages; a number of entries are, in fact, in the nature of long articles. Those dealing with *by*, *ing*, *ham*, *tun*, *thorp* and *wic* are of particular interest, and it is clear that the use and meaning of many names were far more complicated than could have been envisaged thirty years ago. Moreover, a complicating factor is that language is far from being static, and that names change their meaning with changing circumstances. Thus *burna* was the ancient word for stream, but it was often transferred to the names of settlements nearby and it fell into disuse as a living word for stream, to be replaced by *broc*. Similarly, the application of *tun* to enclosure, then to farmstead and so to village meant that *tun* came "to denote much the same kind of settlement as *ham* formerly did", and so *ham* disappeared as a living element in place-name formation. The result is that *ham* names are most frequently encountered in the south-east and in East Anglia, while *tun* or *ton* names are more characteristic of the Midlands. It is through such difficulties as this that Prof. A. H. Smith threads his way with care. The entries are abundantly illustrated with examples; cross-references are frequent, and full account is taken of earlier views on this or that point.

The volumes are accompanied by a number of maps which indicate, among other things, the distribution of Celtic and of Scandinavian place-names. The last is particularly welcome. Isaac Taylor's map of 1863, so often used in the past, has at last been superseded. The work is happily dedicated to Prof. Eilert Ekwall of the University of Lund in Sweden. He is a vice-president of the Society, and his many contributions to the study of English names, particularly his "Dictionary", have placed us all in his debt.

The volumes provide not only a stock-taking of the work so far accomplished but also a guide and stimulus for what is to come. The work of the English Place-Name Society constitutes one of the most important projects of scholarship, on a national scale, that are afoot. It not only illumines the dark places of our history but also furnishes a constant source of interest for those who travel about the countryside or look at its maps. The Society, and not least Prof. Smith himself, are to be warmly congratulated on this *tour de force*.

QUANTITATIVE NEUROANATOMY

The Organization of the Cerebral Cortex

By Dr. D. A. Sholl. Pp. xvi+125. (London: Methuen and Co., Ltd.; New York: John Wiley and Sons, Inc., 1956.) 18*s*. net.

Studies on the Cerebral Cortex (Limbic Structures)

By Santiago Ramón y Cajal. (Translated from the Spanish by Lisbeth M. Kraft.) Pp. xi+179. (London: Lloyd-Luke (Medical Books), Ltd., 1955.) 27*s*. 6*d*. net.

THERE is, at present, good reason for claiming that less is known about the cerebral cortex than any other mammalian organ; at the same time, the demand for an organized body of structural and functional knowledge had increased rapidly during the past thirty years. The neurologist, the psychiatrist and the electroencephalographer are continually asking the neurophysiologist questions about mammalian behaviour which he cannot yet answer. Frequently, because the limitations of neurophysiology are not fully comprehended, hypothesis is confused with established fact, and elaborate structures of explanation are built upon what was never more than scientific speculation.

For this reason I feel that Dr. Sholl's excellent book will interest a wide variety of readers. This work provides a clearly stated review of established facts and hypotheses concerning both the structure and function of the cerebral cortex. In this monograph, Dr. Sholl stresses the limitations of neurohistology, and provides a summary of his own contributions to this field. The latter are, in the writer's opinion, of considerably more importance than their factual content, since they seem to mark the end of an era of descriptive histology and the beginning of a quantitative study of structure.

An English translation, by Lisbeth M. Kraft, of Cajal's papers on the mammalian olfactory cortex is also now available, under the title "Studies on the Cerebral Cortex". Cajal's anatomical studies of the limbic system certainly represent the most comprehensive and precise account available of what is now called the limbic system. Cajal was the master of qualitative micro-anatomy and there are few neurophysiologists who have not leaned heavily upon his works. But while descriptive histology of central nuclei and tracts has proved invaluable to an understanding of the more primitive functions of the nervous system, history shows that it has contributed little to our present understanding of the cerebral cortex.

It is not possible at present to link up such scanty knowledge as we have of cortical function with the available micro-anatomical data, and in fact Dr. Sholl is forced through no fault of his own to present his review in two independent sections, dealing separately with structural and functional information. It is only within recent years that physiological study of the cerebral cortex has become quantitative in nature; the recent development of quantitative micro-anatomy may well prove the essential step toward an understanding of normal and abnormal cerebral function. INTERNATIONAL METEOROLOGY

Scientific Proceedings of the International Association of Meteorology, Rome, September 1954

(International Union of Geodesy and Geophysics, Tenth General Assembly.) (Publication AIM No. 10/c.) Pp. xiii+594. (London: Butterworths Scientific Publications, 1956.) 80s.

THIS publication is the official report of meetings held as part of the tenth general assembly of the International Union of Geodesy and Geophysics. While most of the one hundred and four papers stated to have been read are apparently reported in full, some are merely given in title and many in a short abstract. Against some of these nominally reported papers there is stated the periodical in which a full account was destined to appear.

The meetings, apart from the presidential address by Prof. K. R. Ramanathan, were divided into eighteen colloquia on specific subjects, ranging from cloud physics to numerical prediction of the pressure distribution. The papers relating to the distribution and transport of ozone in the atmosphere seemed to me to be the best. The presidential address is a notable survey of this subject right up to date at the time of delivery. The outlines of a picture of the transport of ozone from the region 20–30 km. high where it is produced by photochemical action on oxygen to the lower atmosphere are beginning to take shape and ozone to be used as a tracer to reveal the circulation.

Dr. Schumann of South Africa put forward a strong plea for the formulation, by a world conference, of an international co-operative plan to guide meteorological research for twenty years or more. This proposal met with strong opposition from the audience of freedom-loving research workers. On a more practical level he demanded much greater co-ordination, simplicity, and uniformity in the publication of meteorological information, rightly pointing out the loss of time involved in searching for data at present. He should be given strong support in this by the World Meteorological Organization, one of the functions of which is to co-ordinate publication arrangements between meteorological services. Perhaps unfortunately, he seems to have attempted to urge too much and, moreover, to have gone out of his way to attack that document beloved of so many meteorologists, the synoptic chart.

Other subjects than those mentioned which were treated very fully at the meeting were radiation and the mechanics of the general circulation. The meteorology of the lowest layers of the atmosphere at normal breathing-level was the most conspicuous absentee. Although there has been at least one instance of a new idea of basic importance being first put forward at a meeting of the International Association of Meteorology, it seems unlikely that the event will often be repeated. Authors are unlikely to wait three or more years for such congresses to publish their new ideas. The most useful functions of congresses seem to be personal intercourse of research workers from all over the world and the preparation and later publication of surveys of the current state of knowledge. G. A. BULL

KEEPING UP WITH LOW-TEMPERATURE PHYSICS

Progress in Low Temperature Physics

Edited by Prof. C. J. Gorter. Vol. 2. Pp. xi+480. (Series in Physics.) (Amsterdam: North-Holland Publishing Company; New York: Interscience Publishers, Inc., 1957.) 42 guilders; 84s.

WITHIN the past year or two, the closely related topics of low-temperature physics and solid-state physics have been exhaustively reviewed: we have had three volumes of "Advances in Solid State Physics", the four relevant volumes of the new "Handbuch der Physik", and now here is the second volume of Prof. Gorter's "Progress in Low Temperature Physics". Even before the appearance of this last, the point had been reached where at least two, and often three or four, lengthy and up-to-date review articles were available on most of the major topics in these fields, and it is a measure of Prof. Gorter's skill as an editor that he has succeeded in choosing for his second volume a number of topics which have not recently been treated elsewhere. Perhaps inevitably, the result has a somewhat heterogeneous appearance. As Prof. Gorter himself remarked in his preface to the previous volume, low-temperature physics nowadays constitutes a 'transverse section' of paragraphs from many different chapters of physics, and it is debatable whether a useful purpose is served by bringing together in one volume a miscellaneous collection of such paragraphs, out of their natural contexts and having little in common but a particular range of temperatures.

In fact, however, some unity has been given to the present series by concentrating largely on one of the classic problems of this field: the behaviour of helium itself. In the present volume, as in its predecessor, almost half the space is devoted to the properties of helium at low temperatures in the solid, liquid and gaseous phases. Van Dijk and Durieux review the evidence leading to the Leyden 1955 vapour-pressure scale, and also discuss briefly the American 1955 scale. It is lamentable that there should be at present two 'rival' temperature scales, and unfortunate that Keller's criticisms of the Leyden scale appeared too recently to be considered in this review. Other articles discuss the properties of liquid helium in slits, in films and below 1° K., and of solid helium. Lastly, there is a lengthy discussion by de Boer of 'solid-like' models of liquid helium, which to some extent complements the more realistic but less rigorous approach described by Feynman in the previous volume.

In contrast to this liberal treatment of helium, the other classic problem of low-temperature physics, superconductivity, is represented here by only one short article on superconducting alloys and compounds. Indeed, in the two volumes together, five times as many pages are devoted to the properties of helium as to superconductivity. This presumably reflects editorial policy: it need scarcely be said that it in no way reflects the relative amount of progress to be reported in the two fields.

The remaining seven articles cover a miscellany of topics, including conduction in metals, properties of semiconductors, the de Haas–van Alphen effect, paramagnetic relaxation, the rare earths, nuclear orientation, and lattice specific heats, and moreover they differ rather widely in level of presentation. In view of this, it is difficult to recommend the volume unreservedly to a general audience. Those working specifically on the properties of helium, however, will no doubt find it a useful companion to the previous volume. R. G. CHAMBERS

PERCEPTION AND UTILIZATION OF LIGHT

Radiation Biology

Edited by Alexander Hollaender, with the co-operation of Sterling B. Hendricks. Vol. 3: Visible and Near-Visible Light. (Prepared under the Auspices of the Committee on Radiation Biology, Division of Biology and Agriculture, National Research Council—National Academy of Sciences, Washington, D.C.) Pp. viii+765. (London: McGraw-Hill Publishing Company, Ltd., 1956.) 75*s*.

THE subject of this volume is of special significance because the transformations of energy with many essential components of living organisms are 'tuned' to radiation in the visible and near visible spectrum. The variety of problems under investigation which belong to photobiology is very large indeed, and it might seem too much to expect that all aspects could be contained in a single volume. Yet, as may be seen from what follows here, the subject is covered in the fifteen chapters remarkably well.

The first three chapters deal with physical problems; first a discussion of energy exchanges involving atoms and molecules, where the use of potential diagrams is developed in relation to the theory of absolute reaction rates. This is followed by a most valuable exposition of the physics of light absorption by molecules; two important classes of biological pigments, carotenoid (polyene) and tetrapyrrolic pigments (chlorin and porphin), are dealt with. This chapter gives an account of some dramatic achievements in this field. Thirdly, there is a longer section on the practical physics of the radiant energy, which is most ably presented. The next four sections deal with photosynthesis: the quantum requirement, the mechanism of photosynthesis, the spectroscopy of the pigments and the formation of chlorophyll in the plant. The discussion on the mechanism of photosynthesis where the physical, physiological, and biochemical approaches are combined is well documented and of a distinctly individual character. The part played by light in the nitrogen cycle of plant growth is discussed separately. I think the climax is reached in Chapters 9 and 10, which give with masterly authority accounts of phototropism and photoperiodism. The writing is well sustained in the following two chapters on seed germination and the relation of light to the physiology of the cell. The next two chapters are concerned with eyes. Although the account of electrical phenomena in vision contains a wealth of information, I was sorry not to find more about human colour vision, more about the biochemistry of visual pigments and just a little about quantum requirements, for aspects analogous to these have whole sections devoted to them in photosynthesis. The account of invertebrate photoreceptors is of a quality which whets the appetite for more (actually, we are promised this by the contributors next year); this chapter, together with the second, on excitation of polylenes and porphyrins, are perhaps largely responsible for the unique character of the book. The last contribution, on the old-established subject somewhat strangely known as 'photodynamic action', contains recent material which is fundamental both to photobiology and to radiobiology as a whole. On the use of the various symbols for defining absorption and extinction coefficients, information is scanty and it is not collected together in any one section. We are given good descriptions of the natural pigments and their absorption spectra but the reader may find difficulties with the quantitative data. The usual convention has been to employ common logarithms in extinction coefficients and natural logarithms in absorption coefficients. The curves given for the chlorophylls have the ordinates labelled absorption but the values are in common logarithms: thus the reader may be compelled to consult other literature unnecessarily. I would have welcomed some selected tables of extinction coefficients for several of the pigments and feel tempted to appeal to future editors concerned with spectroscopic data to allow the publication of data in tabular form rather than, or in addition to, the curves from which it is both difficult and tiresome to get values for different wavelengths.

The editor and his distinguished colleagues are to be congratulated on their skill in producing this volume, which is a valuable addition to literature on general biology. It should appeal to a wide range of advanced students. Though the contributions were mainly completed in 1951 they are an indispensable guide to current research. ROBERT HILL

ADVANCES AND PROBLEMS IN NUCLEAR ENGINEERING AND HOT LABORATORY EQUIPMENT

(IN FIVE VOLUMES)

Vol. 1. ADVANCES IN NUCLEAR ENGINEERING

Vol. 2. ADVANCES IN NUCLEAR ENGINEERING

Vol. 3. HOT LABORATORY OPERATION AND EQUIPMENT

Edited by

John R. Dunning and Bruce R. Prentice

These three volumes form the Proceedings of the 2nd Nuclear Engineering and Science Congress held at Philadelphia, and contain a wealth of new information for engineers, scientists and executives interested in Atomic Energy.

Advances in Nuclear Engineering. Vol. 1 contains the papers on manufacture, production, recovery, and economics of nuclear fuels, spent fuel processing, plant containment concepts and design, plant components, waste disposal, protection and safety measures, and radiation processing. Advances in Nuclear Engineering, Vol. 2, contains the papers on reactor design, reactor core design, operation and maintenance of reactors, metallurgy, natural resources, instrumentation and control, coolant systems, heat transfer and heat evolution, educational uses of reactors, and standardization planning in the nuclear field

Volume 3, entitled Hot Laboratory Operation and Equipment, includes papers on equipment for hot chemical, physical, mechanical and metallurgical operations, hot cell installations, hot laboratory facilities, operation and administration, and specialized hot operations.

Fully Illustrated.
Vols. 1 & 2 £6 6s. 0d. ($18.00) each
Vol. 3 £7 ($20.00).
Set of three vols. £15 15s. 0d. ($45.00).

Vol. 1. PROBLEMS IN NUCLEAR ENGINEERING

Vol. 2. REACTOR OPERATIONAL PROBLEMS

Edited by

D. J. Hughes, Stuart McLain and Clark Williams

Selected Papers from the 1st Nuclear Engineering and Science Congress held at Cleveland, Ohio. The problems facing the nuclear engineer are mainly those dealing with the design of economical power plant, since the theoretical aspects of nuclear power design are relatively well understood. The main problems are those of safety and rapid economical heat removal from the reactor and the problems associated with the production of low-cost fuel. The first of these two volumes presents many of the safety, fuel production, and heat transfer papers presented at Cleveland, while the second volume presents some of the papers which dealt with the recovery of the irradiated fuel and the handling of the plant effluents. In addition papers are included in Volume 2 on experimental low-power assemblies and reactor physics and control and instrumentation

The papers presented here are mainly original and cover engineering subjects. Most of the work was done in government laboratories or by industrial organizations under contracts with the Atomic Energy Commission. Many of the papers summarize the work carried out by several groups of people.

Fully illustrated.
£6 ($17.50) per volume.
£10 ($30.00) per set

SPECIAL DISCOUNT for the complete set of five volumes. £21 ($60.00).

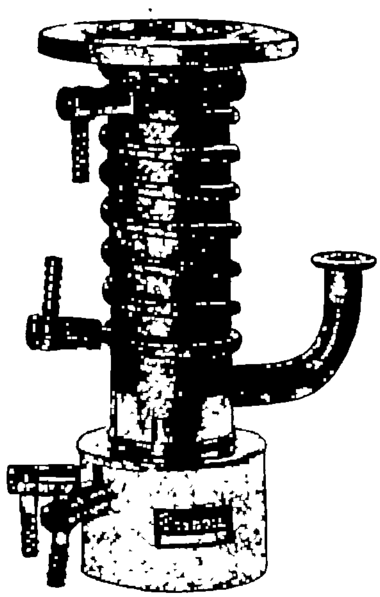
10^{-8} mm. Hg

can be attained

on industrial work



From the early days of Vacuum processing, great strides have been made to improve these techniques; much progress and development of oil diffusion pumps have been accomplished within recent years. Constant demands from industry necessitate still further improvements. Leybold foresaw such future requirements, and started research and development work in this field of vacuum processing many years ago. They have now produced oil diffusion pumps capable of pumping speeds of 30 to 20,000 litres per second, and attaining ultimate pressures of the order of 10^{-8} mm. Hg.

For further information regarding this equipment, please send your enquiries to Leybold Vacuum Sales Ltd., Dept. N.P.

The new MERVYN-HARWELL SQUARE WAVE POLAROGRAPH MARK III combines in one Instrument, all the special needs of the Polarographer who wishes to exploit fully the exceptional merits of this outstanding Analytical Technique.

- Extreme Sensitivity
- Exceptional Selectivity
- Completely self-contained
- Great Versatility
- Ultimate in convenience
- Resolves 20 m.v.
- Built-in cell, thermostat Nitrogen supply and recorder
- Reversible and Irreversible reactions
- All controls located and ganged for rapid and accurate operation.

Valency and Molecular Structure

By E. Cartmell and Dr. G. W. A. Fowles. Pp. xi+256. (London: Butterworths Scientific Publications; New York: Academic Press, Inc., 1956.) 32*s*. 6*d*.

THE authors say in the preface that inorganic chemistry is unpopular in Britain because it includes so many facts, a failing which it shares with organic chemistry, and that it can be made more attractive by discussing the facts in the light of crystal chemistry and valency theory. The results from both these fields are subject to periodical revision, and this has occurred in parts of the text of the book. On p. 169 the bond angle and interplanar angle in hydrogen peroxide are given as 97° and 94° but the figure on the next page shows them as 101·5° and 106°, and on pp. 107 and 168, the bond angle is given as 104½°. This makes the argument for a tetrahedral arrangement less convincing. The statement on p. 169 that steam is about 10 per cent associated is obviously wrong. There is a danger that a student taught too narrowly on such lines will *memorize* a fund of information which will very soon be obsolete.

The book opens with an account of Bohr's theory in which the quantizing relation is due not to Bohr as stated, but to W. Wilson, and it is an accelerated and not simply a moving charge which radiates energy. The introduction to the wave theory is good, but the solutions to the equations can only be stated. Students of chemistry need to know the main results before they can be expected to understand a detailed treatment, but some of the results are given very briefly; two pages suffice for the treatment of the hydrogen molecule by the valency-bond method. The sketch of the molecular orbital method is good and the chapter on directed valency and hybridization should convey some understanding of the principles. The diagrams are particularly clear and helpful.

The third part, dealing with some fields of application, is good, and if the reader does not understand parts of it the references given will enable him to look up the original literature, which in many cases he will find even less intelligible. The book on the whole gives a readable and useful summary of the subjects of which it treats and will be helpful and interesting to students of chemistry.

J. R. PARTINGTON

Quantitative Chemical Analysis

By Cumming and Kay. Eleventh edition revised by Dr. Robert Alexander Chalmers. Pp. xvi+540. (Edinburgh and London: Oliver and Boyd, Ltd., 1956.) 30*s*. net.

PHYSICO-CHEMICAL theories and methods of analysis have been widely extended over recent years, making analytical chemistry a complex subject comprising such individual topics as radioactivity, polarography, chromatography, emission spectroscopy and flame photometry. In order to cover each subject adequately, individual text-books would be necessary for each branch of analysis, but for the convenience of university students one book dealing with some aspects of all methods of analysis is useful. It is to such a class of text-book that this revised edition of "Quantitative Chemical Analysis" belongs.

The subject-matter of the book is divided into the usual sections—the use and care of apparatus, volumetric, gravimetric and gas analyses. Each individual analysis is well described, both in its introductory note and in its practical application. Sections rewritten include a brief, but by no means complete, account of the underlying theories of precipitation, and the chapter relating to colorimetry. Considerable improvement on previous editions can be detected throughout this latter chapter, both in the general classification of the methods and in the inclusion of some of the more modern colorimetric methods of analysis at present in use. It is, however, disappointing to note that the precision of the methods described is not noted. The inclusion of the short section on ethylene diamine tetra-acetic acid, the new versatile reagent for volumetric and colorimetric analysis, is worthy of mention. The final chapter of the book summarizes some of the modern physico-chemical methods of analysis. Another innovation worthy of mention is the inclusion of additional specialized reading matter, appropriately placed at the ends of certain chapters. This is particularly useful to the student who wishes to extend his knowledge beyond the scope of this book. The revised edition of "Quantitative Chemical Analysis" still continues to be of use to the student, but is not sufficiently detailed for the research or advanced worker.

K. FIELD

The Principles of Therapeutics

By Prof. J. Harold Burn. Pp. ix+278. (Oxford: Blackwell Scientific Publications, 1957.) 27*s*. 6*d*. net.

THE Department of Pharmacology in Oxford is a very active one, and a great spate of publications comes from it. Prof. J. H. Burn's lectures to medical students in Oxford have now been published in a short and readable book. It starts with a quotation from Chaucer and a short section on the picturesque origins of materia medica leading to a discussion of the position of drugs to-day. This is followed by about ten chapters dealing with acetylcholine and adrenaline and noradrenaline and histamine and the substances which modify their actions. This is much the best part of the book. It gives a stimulating account of the striking way in which pharmacologists have been able to make fundamental contributions to physiological knowledge. Oxford has played a leading part in these advances and these chapters are richly illustrated with data obtained there.

The rest of the book contains a summary of those other parts of pharmacology which the medical student must learn, enlivened by accounts of how some recent discoveries have been made. For example, the story of ergot is well told; and the work which led to the introduction of thiouracil into medicine is described in detail. The effects of alcohol are discussed at some length and the problems of sterilization receive original treatment.

When Prof. Burn went to Oxford he undertook to give instruction in "Pharmacology and Principles of Therapeutics". He has taken the second part of this title for the name of his book, but this choice may be misleading. These must have been stimulating lectures, but they deal with pharmacology with little more than the usual references to the application of pharmacological knowledge in therapeutics. It has become well-nigh impossible for one man to be an authority on both pharmacology and therapeutics, and the subjects are best taught by two men working together. This book calls for a complementary volume written by a clinician.

J. H. GADDUM

THE MULLARD RADIO ASTRONOMY OBSERVATORY, CAMBRIDGE

By M. RYLE, F.R.S.

THE expansion of the research programme in radio astronomy, which was started in 1946 at the Cavendish Laboratory, has involved the use of increasingly large areas of land. With the completion of the four-aerial radio telescope in 1953 it became clear that further developments on the present site were impracticable, and plans were made for the establishment of a new Observatory at which the work might be extended.

A satisfactory site was eventually found some five miles south-west of Cambridge, and work on the construction of the new Observatory was started in June 1956. This development has been made possible by a generous benefaction from Mullard, Ltd., and by a grant from the Department of Scientific and Industrial Research.

The new Observatory, which will be known as the Mullard Radio Astronomy Observatory, will remain part of the Cavendish Laboratory, and will eventually include all the radio astronomical work at Cambridge; for the next two years, however, the existing site will be retained so that the programmes now being carried out with the present instruments may be finished. The buildings for the new Observatory are now complete, and the installation of two of the new instruments is well under way. A ceremony has been arranged for July 25, at which Sir Edward Appleton will formally open the Observatory.

The site consists of a triangular piece of level ground covering about 180 acres, which will allow the use of aerial systems extending up to 3,500 ft. in an east–west direction, and up to 2,000 ft. in a north–south direction. In addition to the laboratory building which will house the greater part of the electronic apparatus and offices, other buildings are available to provide workshop and storage facilities.

The aerial systems, as in all radio astronomical work, represent the major item of expenditure, and also involve the most difficult problems of design. In the present installation it was decided not to proceed with the construction of a single large general-purpose type of instrument, such as those at Jodrell Bank, Leyden, Harvard and Bonn. Instead, plans have been made for the construction of a number of specialized instruments, each designed to investigate a particular type of problem. In this way it seems possible to build more powerful instruments at considerably smaller cost.

Of the two instruments now being built, one is intended for the study of radio stars, and the other for the investigation of the continuous galactic radiation at a long wave-length.

The further study of radio stars involves two basic requirements: the instrument must have a high angular resolution so that adjacent sources may be distinguished individually, and it must possess a large 'collecting area' in order to detect faint sources without an inconveniently long integration time.

With conventional methods these requirements are conflicting: the use of a short wave-length to improve the resolution involves greater detection problems, since the flux from the source and the sensitivity of present types of receiver both decrease with decreasing wave-length. The use of a longer wave-length allows aerials of larger physical size to be constructed economically since the permissible errors in the 'figuring' and the spacing of the wires in the reflecting surface may be increased; it may, however, still remain difficult to achieve a sufficient resolving power. A wave-length of 1·7 m. was chosen as the best compromise for the radio star instrument, and both the resolving power and the collecting area are to be increased by a new technique which is best described as 'aperture synthesis'.

The number of radio stars which can be resolved is determined by the primary reception pattern of the system, but the use of interference fringes within the primary pattern has been found valuable in distinguishing between the radio stars and irregular features in the background radiation, and in discriminating between classes of radio stars having different 'surface brightness'. It also allows improved positional accuracy. The new radio-star instrument has therefore been designed to operate primarily as an interferometer.

The other instrument now being built also makes use of the principle of aperture synthesis to produce what is effectively a 'pencil beam' system; it is designed to study the distribution of the intensity of the galactic background radiation at a wave-length of 7·9 m. Observations with high resolution have been made at shorter wave-lengths, but they have been limited by lack of sensitivity to regions comparatively close to the galactic equator. Observations at high galactic latitudes at longer wave-lengths have revealed many unexpected features, but the detail available has been restricted by the poor resolving power.

The new instrument is intended to provide a large resolving power with sufficient sensitivity to investigate these high-latitude regions, besides obtaining observations near the equator to compare with those at shorter wave-lengths.

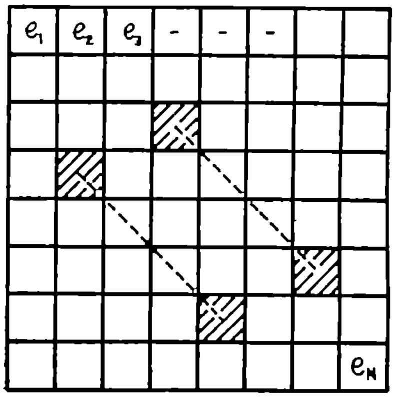

Fig. 1. Diagram to illustrate the principles of 'aperture synthesis'

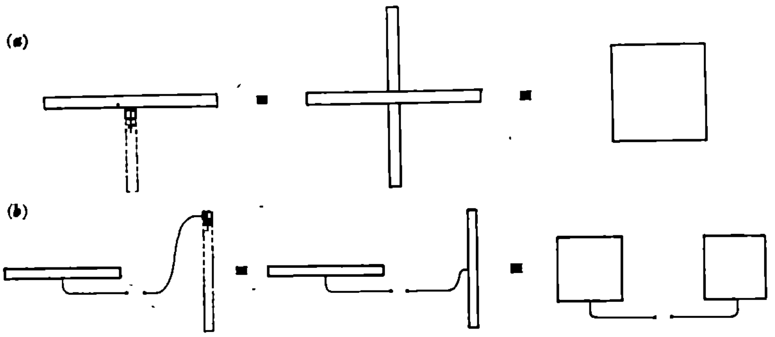

Fig. 2. The synthesis of (a) a single aperture and (b) an interferometer by the moving aerial method. The Mills cross and its interferometric counterpart are shown for comparison

Aperture Synthesis

Consider the formation of the reception pattern of a normal aerial such as a mirror or an array of elementary dipoles connected by feeders. Such an aerial aperture may be regarded as being made up of a number of small elements as shown in Fig. 1, in which electromotive forces of complex amplitude $e_1\, e_2 \ldots e_n \ldots$ are excited by the incident wave.

The magnitude $|E|$ of the output voltage is then given by:

$$|E|^2 = [\sum_N e_n]\,[\sum_N e_m]^*$$

$$= \Sigma|e_n|^2 + \Sigma e_n e_m^*$$

$$= \Sigma|e_n|^2 + \Sigma|e_n|\,|e_m| \cos\varphi_{nm}$$

where φ_{nm} is the phase difference between e_n and e_m. The reception pattern of the aerial arises from the variation of $|E|^2$ as the relative phases of the electromotive forces alter with the direction of the incident wave-front.

If the source of radiation remains constant, the same result can be achieved by using only two elementary aerials and arranging that they are moved to take up, in succession, all the positions of the elements in the real aerial; the addition of the terms $|e_n|^2$ and $|e_n|\,|e_m| \cos\varphi_{nm}$ obtained in this way will be exactly equivalent to the use of the real aerial. This principle will be referred to as 'aperture synthesis'; it can be used to provide a resolving power equivalent to that of a very large aerial without requiring the corresponding complications of construction and operation.

The measurement of $\Sigma|e_n|^2$ involves simply the measurement of the power received by one of the elementary aerials. The cross-product terms $|e_n|\,|e_m| \cos\varphi_{nm}$ may be measured by connecting the two elementary aerials to a phase-switching receiver of the type described by Ryle[1]. If the length of one of the connecting feeders is increased by a quarter of a wavelength, then the quantity $|e_n|\,|e_m| \sin\varphi_{nm}$ may also be determined; both quantities are required for the summation of the cross-product terms with modified values of φ_{nm}. If the phases are altered in such a way as to introduce a progressive phase variation across the aperture, then the summation will yield a reception pattern which is the same as that given by rotating the real aerial. The reception pattern can thus be moved to different directions simply by calculation and without the need for new measurements.

It can be seen from Fig. 1 that many of the arrangements of the elementary aerials are identical; apart from requirements of sensitivity, it is therefore unnecessary to repeat observations in which the relative positions of the two elementary aerials are the same, providing that the amplitude measured for each relative position is scaled by a factor proportional to the number of times that that particular spacing and orientation occur. In order to synthesize a line aperture, for example, a triangular grading of the measured terms is required; a square aperture requires a two-dimensional grading in the form of a pyramid.

If an aperture is split into N elements, corresponding to the use of two movable aerials each of which has an area $1/N$th of that of the synthesized aerial, then it can be shown that it is necessary to measure $2N$ cross-product terms. Once these terms have been measured it is possible, purely by computation, to deduce what response the whole aerial would give in any direction within the reception pattern of one of the elementary aerials. Since the reception pattern of the whole aerial has a solid angle $1/N$th of that of the elementary aerials, a real aerial would have to be set in N separate directions to obtain the same information. With a given integration time, the time taken to scan the sky with the aerial synthesis method is therefore of the same order as that with a large aperture.

There is no reason why the two elementary aerials should be of the same size; in the present instruments two-dimensional motion of the elementary aerials has been avoided by using a small aerial which moves along a north–south line in conjunction with a long fixed aerial which is mounted east–west and which occupies a whole row of the element positions. While this method involves the construction of an aerial of larger area, a long narrow aperture running east–west

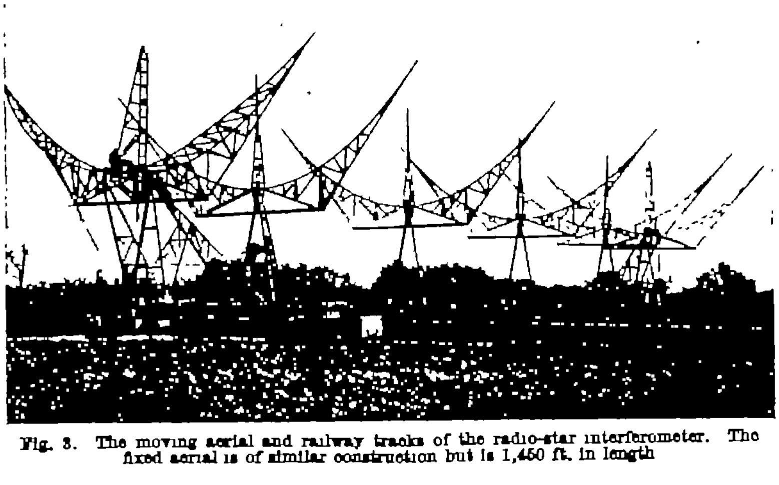

Fig. 3. The moving aerial and railway tracks of the radio-star interferometer. The fixed aerial is of similar construction but is 1,450 ft. in length

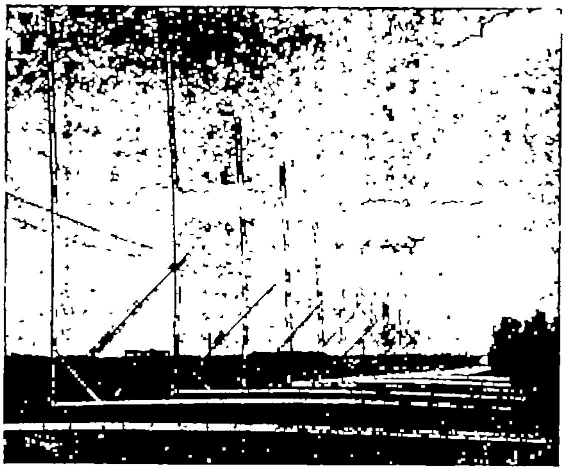

Fig. 4. Part of the fixed aerial of the 'pencil beam' system

can be built very much more economically than a square aperture of comparable size, since it may be supported at many points on the ground, and rotation about the long axis can be achieved without the need for high structures. In addition to simplifying the mathematical processes of record-synthesis, this method decreases the total time of observation in large systems, where scanning in right ascension must make use of the Earth's rotation. The method has been used at Cambridge in a smaller pencil beam instrument built by Blythe.

It can be seen from Fig. 2 (*a*) that the system described is equivalent to the cross-aerial of Mills[2], but it has two important practical advantages: first, it is not necessary to phase the elements of the north–south aperture, since scanning in declination is accomplished in the process of computation; and secondly, it becomes practicable to construct systems of considerably greater sensitivity, since for equivalence the area of the north–south arm of the cross must equal the area covered by the moving aerial.

The synthesis of an interferometer may be achieved in a similar way by taking measurements with a pair of elementary aerials arranged to occupy, successively, all positions in two separated apertures. The practical system which has been adopted is shown in Fig. 2 (*b*); a long fixed aerial running east–west has again been used in conjunction with a smaller aerial moving along a north–south line.

The New Instruments

The radio-star interferometer, which is designed for a wave-length of 1·7 m., comprises a fixed east–west aerial 1,450 ft. long and 65 ft. wide; the moving aerial is 190 ft. long in the east–west direction and 65 ft. wide, and moves along north–south railway lines which are 1,000 ft. in length. Both aerials are cylindrical parabolas made as in the earlier Cambridge interferometer[3] by stretching wires across parabolic tubular steel frames which can rotate about an east–west axis.

The resulting envelope pattern will have a width to half intensity of approximately 25 × 35 min. of arc, and this will contain an interference pattern in right ascension having a lobe separation of about 8 min. of arc. The equivalent 'collecting area' of the instrument will be approximately 190,000 sq. ft., which will provide considerably greater sensitivity than any previous radio-star instrument. The main structure of the moving aerial and the railway tracks are shown in Fig. 3; the construction of the long fixed aerial, which is now being assembled, is similar.

The 'pencil beam' system for galactic study is designed for a wave-length of 7·9 m., and uses a fixed east–west aerial 3,200 ft. long and a moving aerial which has a range of 1,700 ft. Each aerial is in the form of a corner reflector having an aperture of 40 ft. The reception pattern of the instrument will be approximately 1° × 1° to half intensity, and the equivalent collecting area is approximately 200,000 sq. ft. Part of the fixed aerial is shown in Fig. 4.

The operation of both instruments will involve a large amount of mathematical computation to synthesize the recorded data. The co-operation of the University Mathematical Laboratory has been sought, and methods have already been developed for the synthesis on EDSAC of the records obtained with the earlier instrument of Blythe; similar methods will be employed for the new instruments.

In addition to the two large radio telescopes which are now being built, the area of level ground which is available will make possible many investigations employing simpler systems of high resolving power; it is hoped in this way to extend a number of lines of work which have been investigated at the present site.

THE RED ALGAE (1906-56 AND AFTER)

By Dr. KATHLEEN M. DREW

Department of Cryptogamic Botany, University of Manchester

KYLIN'S[1] first work on the red algae "Zur Kenntnis einiger schwedischen *Chantransia*-Arten" was published in 1906, and now, at the end of 1956, seven years after his death, the long-awaited publication of his last work "Die Gattungen der Rhodophyceen"* is welcomed by algologists and doubtless by other botanists as well. The fifty years covered by the period between the appearance of these two works represent a definite period of advance in the study of this interesting group of plants, and, although his interests were by no means confined to the Rhodophyta, Kylin was one of the main contributors to this progress. The results of previously published researches form a substantial part of this new book; but even those fortunate enough to possess some or all of the earlier papers will find it of great help to have the material gathered together in the appropriate order in one volume. This had been done

* C.W.K. Gleerups Forlag, Lund. 125 Sw. Kr., or cloth bound 135 Sw. Kr.

previously in the now unobtainable "Anatomie der Rhodophyceen" of 1937[2]; but apart from the introductory section, the arrangement in the new volume is primarily on a taxonomic basis, and more convenient to use. In this arrangement, it resembles volumes of the "Pflanzenfamilien", for which series this book was planned originally.

While comparison of the book under review with the first edition of the Rhodophyceae in that series by Schmitz and Hauptfleisch[3] shows what advances have been made by comparatively few workers since the date of the earlier volume, comparison between this book and Kylin's book of 1937 is disappointing in showing little change. Instead of a new approach, there is little alteration of those parts of the older text which are used again, although publications calling for a modification of previously expressed views had appeared, for example, Svedelius's[4] classical work on *Galaxaura* and all this implied. Among less important statements, the assertion that the haploid number of chromosomes in haplobionts is 8–10 and in diplobionts 20, and that a spireme exists in prophase of nuclear division may be cited as examples.

Kylin made considerable contributions to our knowledge of the cytology, physiology, anatomy, morphology, taxonomy and classification of the Rhodophyta; but in this book, as its name implies, it is primarily the bearing of his anatomical and developmental studies on taxonomy and classification that is the main theme. These researches, published in papers in 1923[5], 1928[6] and 1930[7], together with others such as those on the Gigartinales[8], Rhodymeniales[9] and the Delesseriaceae[10], led to rearrangements and refinements of the earlier systems of classification, mainly those of Schmitz, and resulted in a more natural grouping of families. Schmitz, on the basis of the development of the carposporophyte, had recognized the Nemalionales, Gigartinales, Rhodymeniales and Cryptonemiales at the end of the last century, and following the same line Oltmanns[11] separated the Ceramiales from the Rhodymeniales. At that time nothing was known of the sequence of somatic and nuclear phases of the life-history. Nevertheless these five orders are still accepted, and to them Kylin[8] added a sixth, the Gelidiales, for the single family the Gelidiaceae. He removed this family from the Nemalionales on the assumption (not yet proved or disproved) that the presence of tetraspores implies a diphasic nuclear cycle. Since then other orders have been erected, the Sphaerococcales, by Sjostedt[12], the Bonnemaisoniales by J. and G. Feldmann[13], the Acrochaetiales by Feldmann[14] and also the Nemastomales by Kylin[15] himself; but in this final work Kylin acknowledges the five orders of his predecessors and his own Gelidiales. While at the time he erected this order there may have been some justification for it, it is not clear why he retained it in the light of modern work on other Nemalionales.

From his work on the development of the carposporophyte, Kylin came to hold very definite views about the auxiliary cells of the Florideae and made the presence or absence of what he termed typical auxiliary cells, as well as their position, a basis for delimiting the orders, as reference to p. 81 will show. There are students of the red algae, including the veteran scientist Svedelius[16], who do not entirely support Kylin's views about the auxiliary cell, but who nevertheless would probably accept his major groupings in the absence of a better system. The establishment of such a better system should be one of the aims of the next generation of workers, each related assemblage being given monographic treatment, and as many characters of diagnostic value as possible found. The Nemalionales would repay such treatment for it appears to be a heterogeneous assemblage, including both very simple and highly elaborate types, whether they be considered from the point of view of vegetative construction or reproduction. Further, Fritsch[17] (p. 656) pointed out some years ago that the basis of distinction used by Kylin for separating the Cryptonemiales and Gigartinales, namely, whether the auxiliary cell is a normal intercalary cell or in an accessory branch, is of minor importance. While agreeing completely with Fritsch, it should be pointed out that this is a character which does not appear to hold in all cases. Various families of these orders should be subjected to further scrutiny to throw light on the value of these diagnostic characters given by Kylin.

A recent study on one of these families, the Kallymeniaceae*, is a start in this direction. Investigated from the taxonomic point of view, there are well-illustrated accounts of the female reproductive branch-systems and the stages in the development of the carposporophyte for species of *Kallymenia*, *Pugetia* and *Callophyllis*. Shorter accounts are included for species of *Polycoelia*, *Erthrophyllum* and *Glaphyrymenia*. Some of the observations suggest the need for a revision of certain accepted features about these structures, for example, that there may not be constancy in the cells which fuse to transfer the fertilization nucleus, for example, in *Kallymenia reniformis*, where the carpogonium is said to fuse with either the supporting-cell or the first cell of the carpogonial branch. Similarly in *Callophyllis*, the trichogyne and supporting-cell are said to fuse in one species and the carpogonium and first cell of the carpogonial branch in another. Similar variation is reported in critical stages in the development of the carposporophyte previously thought to be constant, the most revolutionary being that in *Pugetia fragilissima*. Norris states that "It seems likely that the supporting-cell of some functional carpogonial branches might produce a gonimoblast instead of (or as well as) connecting filaments". Unfortunately there is no information about the early movements of the fusion nucleus, information difficult to obtain, but of the highest importance. This work is of service in emphasizing the need of detailed critical studies in what are considered related forms, but at the same time it raises the question of how relationship should be assessed. Having shown that the supporting cell in *Kallymenia reniformis* does not function as the generative auxiliary cell but gives rise to "connecting-filaments" which fuse with nutritive auxiliary cells, the author leaves *Callophyllis* in the same family although the supporting-cell becomes the generative auxiliary cell. Thereby, the accepted view of the significance of the various types of carposporophytes is brought into question. On the other hand, major rearrangements are best left until alterations can be supported by thorough and detailed investigations of the development and structure of the vegetative parts of the thallus, the reproductive organs and the carposporophyte.
